The Library of the

SEP 3 1974

University of Illinois
at Urbana-Champaign

VOLUME 7, NUMBER 5
MARCH 1, 1974

W74-02151 -- W74-02650

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $45 (domestic), $56.25 (foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 7, NUMBER 5
MARCH 1, 1974

W74-02151 -- W74-02650

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

CALIBRATING A WATER YIELD MODEL FOR SMALL UNGAGED WATERSHEDS,
Kentucky Dept. of Natural Resources, Frankfort. Div. of Water.
J. E. Jarboe, and C. T. Haan.
Paper No. 73-207 presented at 1973 Annual Meeting, American Society of Agricultural Engineers, University of Kentucky, Lexington, June 17-20, 1973. 27 p, 1 fig, 10 tab, 7 ref.

Descriptors: *Small watersheds, Model studies, *Water yield, *Calibrations, Instrumentation, Measurement, *Kentucky, Runoff, *Watershed management.

A four-parameter water yield model was calibrated to small Kentucky watersheds by relating the model parameters to watershed topographic, geologic and soil characteristics. The relationships were tested by comparing observed and simulated runoff records. (SCS)

THE WATER BALANCE OF NEW ZEALAND,
Ministry of Works, Wellington (New Zealand). Water and Soil Div.
C. Toebes.
Journal of Hydrology (New Zealand), Vol 11, No 2, p 127-139, 1972. 1 tab, 23 ref.

Descriptors: *Water balance, Water yield, Water storage, Groundwater, Surface waters, Lakes, *Runoff, Rainfall, *Precipitation (Atmospheric), Data collections, Hydrologic data, *Evapotranspiration.
Identifiers: *New Zealand.

Using spearate estimates of average annual precipitation, evapotranspiration and runoff, a water balance for approximately 10 years was calculated for New Zealand. It is postulated that equilibrium conditions are never reached within the New Zealand hydrological system. The storage factor is relatively small. Only depletion of the groundwater above the base level in New Zealand is likely to have an effect on the water balance. (Knapp-USGS)

WATER-BALANCE METHOD AND ITS PRACTICAL IMPORTANCE, (METOD VODNOGO BALANSA I YEGO PRAKTICHESKOYE ZNACHENIYE),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
P. S. Kuzin.
Meteorologiya i Gidrologiya, No 4, p 99-106, April 1973. 26 ref.

Descriptors: *Water balance, *Hydrologic cycle, Inflow, Discharge (Water), Precipitation (Atmospheric), Evaporation, Runoff, Water storage, *River basins, *Lake basins, Equations.
Identifiers: USSR, Global hydrology.

Evolution of concepts of the water-balance equation and practical importance of the water-balance problem are discussed. Four main objectives in the study of water balance are: (1) determination of the relation of balance items on natural factors (topography, geology, climate, soils, vegetation, etc.); (2) assessment of changes in balance items resulting from man's activities; (3) implementation of measures aimed at more rational use of water resources for power engineering, irrigation, navigation, water supply, etc.; and (4) control of accuracy of actual measurements of hydrometeorological elements and, in some cases, calculation of nonreadily measurable values. Depending on the objectives, the water-balance method can be used to quantitatively determine individual balance items for river basins and other areas and to establish geographic patterns in the distribution of relations between items. Studies of world water balance should begin on a national and regional scale with major river and lake basins to derive more correct estimates of water balance of continents, oceans, and the world. Special attention must be given to distribution of hydrometeorological networks, quality of observations, and accuracy of initial data used in water-balance computations. (Josefson-USGS)

ELEVATION DEPENDENT MODEL FOR ESTIMATING ANNUAL RUNOFF,
Wyoming Univ., Laramie. Water Resources Research Inst.
V. E. Smith, D. A. Anderson, and R. G. Scott.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY12, Paper 10245, p 2293-2311, December 1973. 5 fig, 8 tab, 6 ref, 3 append.

Descriptors: *Topography, *Streamflow forecasting, *Rainfall-runoff relationships, *Mathematical models, Regression analysis.

Two procedures are given for decomposing runoff into components corresponding to different elevations. In the first method, the individual proportions of area in each band are regressed against the respective basin runoffs for each year to determine coefficients that represent the runoff contribution from each elevation band. Applying the principles of ridge regression analysis to this model yields stable estimates. The second procedure is an extension of the first and develops a functional relationship between the elevation variable and runoff. The two procedures were tested on 23 yrs of annual runoff from eight drainages in the upper Green River basin of the Wind River Range. The procedures give hydrologically interpretable results and are useful in modeling a drainage. The procedures are applicable for estimation of annual runoff for ungaged drainages and at stations where gaging has been discontinued. (Knapp-USGS)

HYMO: PROBLEM-ORIENTED COMPUTER LANGUAGE FOR HYDROLOGIC MODELING--USERS MANUAL,
Agricultural Research Service, Riesel, Tex.
J. R. Williams, and R. W. Hann, Jr.
Southern Region Report ARS-S-9, May 1973. 75 p, 4 fig, 1 tab, 8 ref.

Descriptors: *Programming languages, *Computer programs, *Mathematical models, Simulation analysis, Rainfall-runoff relationships, Model studies.

HYMO is a problem-oriented computer language for modeling surface runoff and sediment yield from watersheds. HYMO was designed for planning flood prevention projects, forecasting floods, and research studies. It consists of a main program and 16 subroutines written in FORTRAN IV, but it can be used by hydrologists with little knowledge of computer programming. The language provides 17 commands for the hydrologist to use in any sequence for application to any watershed. HYMO was designed to transform rainfall data into runoff hydrographs and to route these hydrographs through streams and valleys or reservoirs. It will also compute the amount of sediment produced by a storm at nay point on a watershed. It will be useful to research hydrologists in studying the effects of watershed and storm characteristics on the flood hydrograph. HYMO is also a good research tool for testing hydrologic procedures. The hydrologic procedures used in HYMO are practical--required inputs are easy to obtain for most watersheds. HYMO was written for the IBM 360-65 computer, but it could be run on an IBM 1130 with little modification. The storage requirement is about 73K. (Knapp-USGS)

WATER-RESOURCES APPRAISAL OF FISH LAKE VALLEY, NEVADA AND CALIFORNIA,
Geological Survey, Carson City, Nev.
F. E. Rush, and T. L. Katzer.
Nevada Division of Water Resources, Water Resources-Reconnaissance Series Report 58, 1973. 70 p, 9 fig, 21 tab, 21 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater resources, *Nevada, *California, Valleys, Hydrologic data, Water quality, Chemical analysis, Precipitation (Atmospheric), Runoff, Streamflow, Flow rates, Hydrogeology, Water wells, Water yield, Water supply, Water utilization, Water demand, Irrigation, Mining, Well data, Groundwater recharge, Hydrology.
Identifiers: *Fish Lake Valley (Nev. and Calif.).

Fish Lake Valley is in Esmeralda County, Nevada, and the adjoining part of Mono County, California. Fish Lake Valley has a population of about 200 in an area of about 1,010 square miles. The local economy is principally ranching and farming; however, some mining is done on an intermittent basis. The nearest trade center is Bishop, California, about 50 road miles southwest of the valley. The report describes the hydrologic environment; appraises the source, occurrence, movement, and chemical quality of water in the

area; estimates average annual recharge to and discharge from the groundwater reservoir; provides preliminary estimates of perennial yield and groundwater in storage; and estimates present and potential water development in the area. The field work was done mostly during August 1970 and March 1971. Groundwater development in Nevada has shown a substantial increase in recent years. A part of this increase is due to the effort to bring new land into cultivation, a renewed interest in mining, and a growing population. (Woodard-USGS)
W74-02616

SUMMARY OF HYDROLOGIC CONDITIONS IN COLLIER COUNTY, FLORIDA, 1972,
Geological Survey, Tallahassee, Fla.
J. McCoy.
Open-file report 73022, 1973. 118 p, 11 fig, 8 ref, append.

Descriptors: *Hydrologic data, *Water resources development, *Surface waters, *Groundwater resources, *Florida, Streamflow, Flow rates, Gaging stations, Water wells, Aquifer characteristics, Water yield, Water level fluctuations, Water utilization, Canals, Water quality, Chemical analysis, Basic data collections, Rainfall, Hydrology, Groundwater recharge, Urbanization.
Identifiers: *Collier County (Fla), *Naples (Fla).

This report is a continuation of annual summaries of hydrologic conditions in Collier County, Florida, which began in 1968. Streamflow and water-level fluctuations are graphed for the 1972 year (October 1971 to September 1972). Water-quality data are presented in table, graph, and diagram forms for their periods of record. Changes in hydrologic conditions are monitored by a data-collection network throughout the county and in the urbanized Naples area. The county-wide network consists of 5 streamflow gaging stations, 16 wells equipped with continuous water-level recorders, 19 wells sampled semiannually for chloride analyses, and 13 surface-water sites sampled semiannually for nutrient analyses. The Naples network consists of 1 streamflow gaging station, 3 wells equipped with continuous water-level recorders, about 75 wells sampled and/or measured semiannually for semiannually for chloride analyses and/or water-level fluctuations, and 4 surface water sites sampled quarterly for extensive analyses of chemical, physical, and bacteriological parameters. (Woodard-USGS)

PROPOSED WATER-RESOURCES AND LAND--CAPABILITY INVESTIGATION, ARUSHA REGION, TANZANIA,
Geological Survey, Lakewood, Colo.
E. D. Gordon, and J. F. O'Rourke.
Open-file report, March 1973. 118 p, 15 fig, 34 ref, 2 append.

Descriptors: *Water resources, *Surface waters, *Groundwater resources, *Land development, *Foreign countries, Tropical regions, Hydrologic data, Topography, Geology, Soil types, Climatic data, Water quality, Vegetation, Land use, Water supply, Human population, Water utilization, Rainfall, Temperature, Hydrology, Planning, Water resources development.
Identifiers: *United Republic of Tanzania.

The findings of a 3-month Phase I reconnaissance evaluation of the water-resources and land-use problems of the Arusha Region in north-central Tanzania are described. The scope, objectives and requirements are outlined for a proposed longer-term more intensive Phase II survey needed to develop a Master Water Plan for the Region. The Arusha Region lies 2 deg to 6 deg south of the Equator, and consequently, temperatures are relatively uniform throughout the year. Annual rainfall, which ranges from about 15 to slightly more than 60 inches, varies with elevation. In the cooler, higher and water-surplus areas cash-crop farming provides the economic base, but in the warmer, lower and water-deficient areas the economy is predominantly pastoral. The chief water and land-use problems in the Region are: (1) insufficient water supplies in some of the drier areas for human consumption; (2) insufficient water and forage in some areas to meet overlapping requirements of wildlife and livestock; and (3) increasing human, livestock, and agricultural pressure on the land and water resources of some areas with consequent deterioration of the wildlife habitat. PSYCHROMETRIC DATA PATTERNS AND PREDICTION MODELS,
Wyoming Univ., Laramie. Water Resources Research Inst.
L. O. Pochop, S. A. Morton, and R. L. Cornia.
Available from the National Technical Information Service as PB-226 116, $3.00 in paper copy, $1.45 in microfiche. Water Resources Series No. 38, October 1973. 21 p, 6 fig, 7 tab, 9 ref. OWRR A-008-WYO (1). 14-31-0001-3851.

Descriptors: Water vapor, *Climatic data, Humidity, Air temperature, *Atmosphere, Hygrometry, Forecasting, *Wyoming, Model studies, Distribution patterns.
Identifiers: *Psychrometic data, *Prediction models.

Good psychrometric data are among the most difficult of all climatic parameters to obtain. However, uses of psychrometric data are numerous, especially in the field of water management. Results are presented of an investigation of the temporal and spatial patterns of the psychrometric data in Wyoming. Models for predicting psychrometric data from dry-bulb temperature, are included.
W74-02220

APPLICATION AND CONSEQUENCES OF PRECIPITATION OBSERVATIONS IN THE REPUBLIC OF SUDAN IN VIEW OF THE NOMADIC LIFE AND ECONOMY,
Southern Oregon Coll., Ashland. Dept. of Geography.
R. M. Hammer.
Geoform, No 14, p 11-18, 1973. 6 fig, 12 ref.

Descriptors: *Rainfall, *Satellites (Artifical), *Weather forecasting, Forages, Arid lands, *Climatic data, *Mapping.
Identifiers: *Sudan, Nomadism.

Rainfall data in Sudan reveal that 70 percent of the rainfall is produced by 25-30 percent of the storms. For agricultural purposes, where nomadism is an important factor in this arid country, forecasting occurrence of occasional heavy rain storms is of the utmost importance. Forage for livestock is dependent to a large extent on rainfall, and transhumance follows this pattern. Using satellite visible and infrared imagery, general rainfall conditions were verified, and daily rainfall determined. A series of maps showing the combined distribution of rainfall and clouds was produced, indicating that major cloud growth is associated with mountains and secondarily with water surfaces. STORM RAINFALL IN THE CARPATHIANS IN JUNE 1969,
Ukrainskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Kiev (USSR).
P. M. Lyutik, and Ye. N. Kiptenko.
Soviet Hydrology: Selected Papers, No 5, p 417-425, 1971. 4 fig, 4 tab, 6 ref. Translated from Ukrainian Hydrometeorological Scientific Research Institute (Trudy UkrNIGMI), No 104, p 115-126, 1971.

Descriptors: *Storms, *Rainfall, Rainfall intensity, Runoff, Surface runoff, Storm runoff, Floods, Flood discharge, Runoff coefficient, Rainfall-runoff relationships, Mapping, Isohyets.
Identifiers: *USSR, *Carpathians.

Heavy rains in June 1969 produced disastrous floods in the Dniester, Prut, Seret, and Tisza River basins in the Eastern Carpathians. Continuous rainfall occured between June 7 and 10, amounting to 300 mm or more at many meteorological stations and exceeding normal June precipitation by a factor of 2-3. Maximum rainfall amounts were recorded during this storm at several meteorological stations in the Prut River basin (317 mm at Yablonovo and 397 mm at Kabaki). Total rainfall depth between June 7 and 10 over an area exceeding 22,000 sq km 100 mm or more. Largest amounts of rainfall occurred on northeastern slopes of the Carpathians and in the Ciscarpathians. Daily rainfall was heaviest in upper reaches of the Bystritsa Solotvinskaya River (239 mm), Bystritsa Nadvornyanskaya River (215 mm) and Prut River (173 mm). Daily rainfall was somewhat less (100-150 mm) in upper parts of the Seret, Cheremosh, Lomnitsa, Svicha, Stryy, and Tisza River basins. Daily rainfall was lowest (25-50 mm) in the Transscarpathians and in basins of the Tereblya, Rika, Latoritsa, and Uzh Rivers. Daily rainfall during the first ten days of June, changes in maximum rainfall depth and average rainfall intensity as a function of rainfall duration, and flood-runoff depths and coefficients for Carpathian Rivers are tabulated. (Josefson-USGS)
W74-02606

STORM RAINFALL IN THE BLACK SEA REGION AS A FACTOR IN SOIL EROSION,
Ukrainskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Kiev (USSR).
N. I. Konovalova, and N. K. Mirotvorskaya.
Soviet Hydrology: Selected Papers, No 5, p 425-428, 1971. 2 fig, 3 tab, 5 ref. Translated from Ukrainian Hydrometeorological Scientific Research Institute (Trudy UkrNIGMI), No 104, p 134-138, 1971.

Descriptors: *Storms, *Rainfall, *Rainfall intensity, *Soil erosion, Slopes, Runoff, Overland flow, Probability, Equations.

Identifiers: *USSR, *Black Sea region.

Soil erosion in the southern Ukraine is greatly affected by storm rainfall. In the Ordinary Chernozem zone in the northwestern part of the Black Sea region, erosion can be produced by a rainfall intensity of about 1.0 mm/min and on strongly eroded slopes by a rainfall intensity of 0.7-0.8 mm/min. These heavy rains occur on an average of two to three times a year, and heavier rains with a maximum intensity of 2.0 mm/min occur once every three to five years. An increase in rainfall intensity sharply increases soil erosion. The effect of different rainfall intensities on runoff and erosion is graphed, and probable and maximum possible durations of downpours of different intensities are tabulated. (Josefson-USGS)
W74-02607

WATER RECYCLING OF SEWAGE EFFLUENT BY IRRIGATION: A FIELD STUDY ON OAHU,
Hawaii Univ., Honolulu. Water Resources Research Center.
L. S. Lau, P. C. E. Kern, P. Loh, R. H. F. Young, and G. L. Dugan.
Technical Report No. 62, November 1972. 89 p, 24 fig, 5 tab, 52 ref.

Descriptors: Rainfall, Rainfall disposition, *Rainfall intensity, Measurement, Climatology, Meteorology, *Climatic data, Irrigation, Recycling, *Water reuse, *Sewage effluents, *Hawaii.

Annual, monthly, and hourly rainfall data for Hilo, Hawaii are plotted and analyzed as a preliminary phase of the study of space-time variations in high intensity rainfall in this locality. A brief summary of the Hilo climate is provided. Annual rainfall amounts are shown to be highly variable, while the annual rainfall frequency remains relatively constant at about 33 percent. Monthly rainfall and maximum 24-hour rainfall amounts are displayed in the form of a monthly rainfall expectancy graph. Hourly rainfall amounts are divided into four intensity categories: 0.01 - 0.24, 0.24 - 0.49, 0.50 - 0.99 and > or equal to 1.00 inches per clock hour. The percentage distribution of annual and monthly rainfall amounts and frequencies by rainfall intensity category are plotted and discussed. Hourly data are displayed in a series of monthly diurnal distributions by rainfall intensity category. (Fullerton-Hawaii)

MEASURING SNOWFALL, A CRITICAL FACTOR FOR SNOW RESOURCE MANAGEMENT,
Wyoming Univ., Laramie. Water Resources Research Inst.
P. A. Rechard, R. E. Brewer, and A. Sullivan.
Typescript, (1973). 10 p, 4 fig, 11 ref. NOAA 1-36055.

Descriptors: *Measurement, *Snowfall, *Snow management, *Computer models, Watershed management, *Gages, Instrumentation.

With the advent of detailed computer modeling techniques for determining the effects of watershed management practices, the ability to quantify the precipitation input is of critical importance. The measurement of precipitation in the form of snow is an observation task which to date has proven unsatisfactory. Under windy conditions the catch of snowfall by usual precipitation gages may be eighty percent in error. The findings of this study indicate that the catch of a gage placed in a manmade site shield utilizing the blowfence design, termed the Wyoming Shield, can duplicate that of a gage placed within a forested opening. The advantages of the Wyoming Shield are that it is always uniform, i.e. not subject to the natural variations in timber protection, it provides freedom of choice for siting a gage, and it is relatively inexpensive. As a general guide, unshielded gages catch per season from one-third to one-half the amount of precipitation that a well-protected gage in a forest opening catches. A gage with only a free swinging Alter-type shield catches from two-thirds to three-fourths the amount a well-protected gage catches, while a gage shielded with the Wyoming Shield configuration will catch about the same amount.

PREDICTING AVALANCHE INTENSITY FROM WEATHER DATA: A STATISTICAL ANALYSIS,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
A. Judson, and B. J. Erickson.
Research Paper RM-112, August 1973. 5 fig, 3 tab, 5 ref.

Descriptors: *Avalanches, *Weather data, *Regression analysis, Statistics, Data collections, Forecasting, Snowpacks, Precipitation (Atmospheric), Winds, *Colorado, Storms.
Identifiers: *Avalanche forecasting.

Nineteen weather factors were analyzed to determine which have the highest correlation with avalanche activity. A simple two-parameter storm index and a discriminant function model were found to predict the likelihood of avalanches in Colorado's Forest Range. The storm index utilizes precipitation intensity modified by windspeed to predict the number of avalanches expected on 23 paths. The discriminant function model was used in conjunction with a multiple regression program to classify snow as stable or unstable on eight avalanche paths. This analysis shows that a linear combination of the maximum 3-hour precipitation intensities, windspeed resolved to an optimum direction for each path, and the sum of the negative temperature departures from 20 deg F could be used to determine whether a slope will avalanche 70% to 80% of the time. DETERMINATION OF THE MICROLEVEL TEMPERATURES DURING LAKE COOLING, ICE FORMATION, ICEMELT AND THE BREAK-UP OF THE ICE COVER OF A MOUNTAIN LAKE, HOLLAND LAKE, MISSOULA COUNTY,
Missoula. Dept. of Zoology.
L. G. Browman.
Available from the National Technical Information Service as PB-226 241 $2.75 in paper copy, $1.45 in microfiche. Montana University Joint Water Resource Research Center, Bozeman Report No. 40, (1973) 12p, 2 tab, 12 ref. OWRR A-04-MONT (1).

Descriptors: *Ice, *Lake Ice, *Melting, *Thawing, *Montana, *Temperature.
Identifiers: *Holland Lake (Mont), Ice formation, Microlevel temperatures, Ice breaking.

The primary objective was to determine the microlevel temperatures during lake cooling, ice formation, ice melt and the break-up of the ice cover of a mountain lake. The observations were carried out on Holland Lake, Montana which is located west of the Continental Divide at an elevation of 1,225 meters, is roughly 165 hectares in area with a maximum depth of 48 meters. It is a dimicitc, Oligotrophic lake surrounded by a complex of Douglas fillarch forest. (Holje-Montana)

COMBINED HEAT, ICE AND WATER BALANCES AT SELECTED GLACIER BASINS. PART II: SPECIFICATIONS, STANDARDS AND DATA EXCHANGE.

UNESCO/IASH Contribution to the International Hydrological Decade (Technical Papers in Hydrology, No 5); Paris, 1973. 32 p, 2 fig, 1 tab, 5 ref, append.

Descriptors: *Glaciohydrology, *Water balance, *Glaciology, *International Hydrological Decade, Water sources, Data collections, Heat, Ice, Melt water, Heat balance, Snow.
Identifiers: *Glacier basin hydrology.

The International Hydrological Decade (IHD) project concerned with the combined heat, ice, and water balances at selected glacier basins marks an important step in broadening the understanding of snow hydrology, high mountain and glacier hydrology, and the relation of glacier variations to changes in climate. The specific objective of the project is to obtain sufficient information to define and understand heat, ice and water blances and how they change with time at a number of glacier basins situated in widely differing environments in many parts of the world. Emphasis is on specifications and standards for types, locations, and timing of measurements, with particular attention given to heat balances. The intention is to provide a basis for international cooperation in attaining standardized measurements of all three glacier balances. This project is intimately linked to many other Decade projects such as the world inventory of perennial ice and snow masses, variations of existing glaciers and the world water balance. ANTARCTIC LIMNOLOGY: A REVIEW,
R. B. Heywood.
Br Antarct Surv Bull. 29, p 35-65. 1972. Illus.
Identifiers: *Antarctic limnology, Climates, Geography, History, *Reviews, Cold regions.

Information on Antarctic inland waters is presented against a background of historical geographical, topographical, geological and climatic detail. Present knowledge suggests that aridity is the most important climatic factor determining the variety of lake and pool environments in Antarctica. Comparison with Arctic inland waters indicates that the considerably poorer biota of Antarctica largely reflects the isolation and the youth of the ecosystem. The review reveals the need for basic, comprehensive research program in all areas of the continent.--Copyright 1973, Biological Abstracts, Inc.

THERMAL REGIME OF THE LOWER REACHES OF THE DANUBE RIVER IN AUTUMN AND WINTER,
Ukrainskii Nauchno-Issledovatelskii Gidrometeorologidheskii Institut, Kiev (USSR).
A. V. Shcherbak, and L. I. Solopenko.
Soviet Hydrology: Selected Papers, No 5, p 414-417, 1971. 1 fig, 1 tab, 8 ref. Translated from Ukrainian Hydrometerorological Scientific Research Institute (Trudy UkrNIGMI), No 104, p 52-56, 1971.

Descriptors: *Ice, *Temperature, *Heat balance, *Water cooling, *Seasonal, Autumn, Winter, Air circulation, Synoptic analysis, Forecasting, Probability.
Identifiers: *USSR, *Danube River, Heat exchange.

Results are presented of investigations of the thermal regime of the Soviet reach of the Danube River in autumn and winter. Average long-period (1945-68) ten-day water temperatures in the reach are tabulated, and a relation of beginning dates of ice formation in the river at Izmail to the heat content of river water and the index of the combination of synoptic processes is graphed. The probability of early and late dates of ice formation is 89% and 83%, respectively. The relation obtained can be used to prepare a tentative forecast of development of ice phenomena in the Soviet reach of the Danube in autumn and winter. (Josefson-USGS)

EXPERIENCE IN A QUANTITATIVE ASSESSMENT OF ORGANIZATION OF SNOW COVER AS A NATURAL SYSTEM (OPYT KOLICHESTVENNOY OTSENKI ORGANIZATSII SNEZHNOGO POKROVA KAK PRIRODNOY SISTEMY),
E. G. Kolomyts.
Institut Geografii Sibiri i Dal'nego Vostoka Doklady, No 34, p 44-56, 1972. 6 fig, 1 tab, 16 ref.

Descriptors: *Snow cover, *Snow, *Crystals, *Estimating, *Statistical methods, Correlation analysis, Sublimation, Entropy, Winter, Curves, Maps.
Identifiers: *USSR, Siberia.

Snow cover is examined as a natural community of crystals of different sizes and shapes. This community has a definite degree of metamorphism, whose parameters are the complexity and degree of ordering of the snow layer and its individual horizons. A quantitative assessment was made of the degree of metamorphism of snow, based on the principles and techniques of the systems theory, the information theory, and the set theory. Relations suitable for calculating parameters of the organization of any natural systems are presented. A sketch map of the degree of metamorphism of snow cover in forested and adjoining regions of the USSR was constructed from an empirical relation of the measure of disordering of the snow layer to the magnitude of latitudinal continentality in winter in lowland and mountain taiga regions of West and East Siberia. (Josefson-USGS)

BEAR GLACIER HAS COME ALIVE (LEDNIK MEDVEZHIY OZHIL),
Akademiya Nauk SSSR, Moscow. Institut Geografii.
L. D. Dolgushin.
Priroda, No 8, p 114-116, August 1973. 3 photo, 2 ref.

Descriptors: *Glaciers, *Lakes, *Movement, Ice, Snowmelt, Mountains, Alpine.
Identifiers: *USSR, *Bear Glacier, *Glacier surges.

The present advance of Bear (Medvezhiy) Glacier in Tadzhikistan was first detected on April 17, 1973. Initial reports indicated that the glacier terminus had already advanced a distance of 1,400-1,500 m and had divided the Abdukagor and Dustiroz Valleys. According to estimates, the glacier surge began no later than early March. By May 9 the glacier tongue, which was 150-200 m thick, had moved 1.5 km down valley along the Vanch River, advancing out to the Abdukagor Valley and forming a lake with an accumulation of 6-7 million cu m of water. The glacier terminus continued to move at a rate of 4-5 m a day, while the lake level rose at a rate of about 50-70 cm a day. By the end of May, about 9 million cu m of water had already accumulated in the lake. An outburst of the lake through its ice dam will produce severe flooding in the Vanch Valley and, possibly, a destructive mudflow, thereby endangering the Vanch Hydroelectric Station, bridges across the Vanch River, highways, powerlines, and a number of dwellings in the populated Vanch River Valley. According to the latest progress report (June 4, 1973), precautionary measures are being taken to protect the inhabitants and to prevent possible damage. The Pamir Alpine Expedition of the USSR Academy of Science's Institute of Geography and an expedition of the Tadzhik Administration of the Hydrometeorological Service are conducting systematic observations of the glacier advance and of the accumulation of water in the dammed lake. HYPERBOLIC STRESS EQUATIONS FOR COMPRESSIBLE SLABS,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
R. I. Perla.
International Journal of Non-Linear Mechanics, Vol 8, p 253-259, 1973. 2 fig, 1 tab, 1 ref.

Descriptors: *Stress, *Snowpacks, *Equations, *Deformation, Compressive strength, Shear strength, Creep, Elastic theory.
Identifiers: *Snow mechanics.

In principle it is possible to formulate a system of stress equations for slabs composed of compressible materials such as snow. A constitutive law, chosen to model isotropic compressible slabs, is specialized for plane deformation and then substituted into the equations of motion. The resulting system is quasi-linear hyperbolic. Solutions depend on measurements of a deformation-rate parameter, D. The characteristics of the hyperbolic system span a distance 2DH, where H is the penetration of the characteristics into the slab. It is a feasible task to measure in situ the deformation or flow field of select portions of many types of slabs. For example, the flow field of a portion of a snow slab, which under body forces may compress to over 100% increase of density, is easily determined by following the movement of lightweight tracers (ping-pong balls, styrofoam plats, etc.) inserted into the slab. Slab stress can be inferred directly from such in situ measurements. (Knapp-USGS)

2D. Evaporation and Transpiration

EVAPORATION FROM SNOWDRIFTS UNDER OASIS CONDITIONS,
Wyoming Univ., Laramie. Water Resources Research Inst.
P. A. Rechard, and C. N. Raffelson.
Typescript, (1973). 10 p, 1 fig, 4 tab, 6 ref. NOAA 16-258-CA.

Descriptors: *Snowpacks, *Evaporation, *Wyoming, Measurement, Snowmelt.
Identifiers: *Pole Mountain (Wyo), *Snow fences.

It is possible to modify snow accumulation patterns by utilizing artificial wind barriers, such as snow fences. However, economical utilization of the snowdrifts requires that the resultant increase in water supply be obtained at a reasonable cost which assumes an ability to estimate the increase. To determine the quantity of increased water supply, it is necessary to know the amount of water lost from the drift through evaporation. A study to measure evaporation was conducted on Pole Mountain in southeastern Wyoming, wherein two snowdrifts were formed on top of butyl rubber mats behind two separate snow fences, each 8 feet high (2.4 m) x 100 feet (30 m) long. The water equivalents of the drifts were determined, and the quantity of runoff from the melting of the drifts was measured. Since there could be no infiltration, the difference between the water equivalency of the drift and the runoff was a measure of the evaporation, which during the one-month ablation period, was approximately 20-30 percent of the volume of the drift at the start of ablation. During the melt season the snowdrifts are 'oases' of snow, in that they are surrounded by bare ground. Because of this fact, and the extreme wind packing of the snow, existing models to compute evaporation are not adequate.

A STUDY OF ITEMS IN THE GROUNDWATER BALANCE OF WATERLOGGED AREAS (OB UZUCHENII ELEMENTOV BALANSA GRUNTOVYKH VOD NO ZABOLOCHENNYKH UCHASTKAKH),
A. Yesenbekov.
Uzbekskiy Geologicheskiy Zhurnal, No 1, p 79-81, 1973. 2 fig, 1 tab, 4 ref.

Descriptors: *Evapotranspiration, *Evaporation, *Transpiration, *Saturated soils, *Lysimeters, Vegetation, Grasses, Plant growth.
Identifiers: *USSR.

Lysimeters filled with undisturbed soil samples 1.44 sq m in area and 2.0 m deep were used to determine total evaporation from waterlogged areas (with and without natural vegetation) in the Amu-Dar'ya Delta in 1967-70. Maximum evaporation from a bare waterlogged surface was observed during the hottest days of August (1967) and was 2,286.2 cu m/ha. Maximum evaporation from waterlogged areas covered by bulrushes (9,740.3 cu m/ha) was observed in July (1970). Maximum evaporation from an area of dry-valley grasses was 4,650 cu m/ha. Relation of total evaporation from waterlogged areas covered by bulrushes to their growth, and total evaporation from an area of dry-valley grasses at a water table depth of 0.5 m from the soil surface are graphed. (Josefson-USGS)

EVAPOTRANSPIRATION AND WATERSHED RESEARCH AS RELATED TO RIPARIAN AND PHREATOPHYTE MANAGEMENT--AN ABSTRACT BIBLIOGRAPHY.
Forest Service (USDA), Tempe, Ariz. Forest Hydrology Lab.

Available from GPO, Washington, DC 20402 Price $2.00. Forest Service Miscellaneous Publication No 1234, January 1973. J. S. Horton, Compiler, 192 p, 691 ref.

Descriptors: *Evapotranspiration, *Riparian water loss, *Phreatophytes, *Bibliographies, *Abstracts, Information retrieval, Publications, Water loss, Vegetation, Lysimeters, Climates, Environmental effects, Analytical techniques, Indexing, Energy budget.

Published information is presented that will help land managers and research workers to: (1) evaluate relations of vegetation to water loss and (2) estimate the probable effect on water yield of manipulating vegetation. The bibliography emphasizes moist-site vegetation, both phreatophyte and riparian, but watershed and plot studies are included if they can be useful in determining the effect of vegetation management on water yield. The development and use of various kinds of lysimeters are comprehensively reviewed to give a full picture of their value in determining evapotranspiration losses. Methods of estimating or measuring water losses (such as sap-flow instrumentation or the energy-budget approach) are given full coverage; even though in many cases the studies were carried out on agricultural lands, the methods might be adapted for use with moist-site vegetation. Articles on the various processes affecting evapotranspiration, including physiological, climatic, and general environmental processes are included if they have a direct bearing upon measurement of water loss in phreatophyte and riparian situations. The 691 references are arranged alphabetically by author within the subject-matter class. An author index gives item numbers. (Woodard-USGS)

2E. Streamflow and Runoff

LONG WAVES IN SHALLOW TRIANGULAR CHANNELS,
Wisconsin Univ., Madison.
T. Green.
Journal of Hydraulic Research, Vol 11, No 1, p 69-90, 1973. 12 fig, 17 ref.

Descriptors: *Waves (Water), *Flood waves, *Seiches, Mathematical studies, Tides, Surges, Bores.

Long waves travelling along rivers or channels were studied in a very simple analytical model which still preserves the desired characteristics of cross-channel depth variation and asymmetry: a straight, shallow channel of general triangular cross-section. A number of rivers have depth profiles which are somewhat triangular. Similar analytical techniques could be used to study waves in shallow channels of any prismatic cross-section. (Knapp-USGS)

A SHEAR PLATE FOR USE IN OSCILLATORY FLOW,
Queen's Univ., Kingston (Ontario). Coastal Engineering Research Lab.
P. H. Riedel, and J. W. Kamphuis.
Journal of Hydraulic Research, Vol 11, No 2, p 137-156, 1973. 9 fig, 16 ref.

Descriptors: *Unsteady flow, *Shear stress, *Waves (Water), *Instrumentation, Laminar flow, Turbulent flow, Roughness (Hydraulic), Data collections, Hydraulic models.
Identifiers: *Oscillating water tunnel.

A floating-element shear stress transducer provides an accurate means for measuring shear stress on smooth and rough beds under oscillatory flow. It is especially useful for measurements in oscillatory boundary layers because a knowledge of the boundary layer structure is not required. The instrument gives complete response to forcing functions with periods greater than 0.5 seconds and may be used to measure shear stresses in the range 0.015-100 N per sq m. Accurate computation of forces requires: (a) measurement of the pressure acting on the leading and trailing edges of the shear plate, (b) an assumption regarding the manner in which the pressure force acts on the roughness elements and (c) calibration of the shear plate for vertical load. HURRICANE AGNES FLOODS EAST MAHANTANGO CREEK,
Agricultural Research Service, University Park, Pa. Northeast Watershed Research Center.
E. T. Engman, L. H. Parmele, and W. J. Gburek.
Paper No. 73-205 presented at 1973 Annual Meeting, American Society of Agricultural Engineers, University of Kentucky, Lexington, June 17-20, 1973. 17 p, 9 fig, 1 tab, 11 ref.

Descriptors: *Pennsylvania, *Tropical storms, Excessive precipitation, *Rainfall intensity, Runoff, *Rainfall-runoff relationships, Watershed management.

The greatest rainfall amounts from the June 1972 tropical storm which devastated the Susquehanna River Valley occurred over the East Mahantango Creek Watershed, Pennsylvania. The rainfall intensities and peak runoff rates both surpassed the expected values for a 100-year event. In the latter part of the storm, data from the 7.8 sq km watershed indicate that runoff rates were approximately equal to the rainfall rates. (SCS)
W74-02174

TWO-DIMENSIONAL WAVES GENERATED BY A SURFACE PRESSURE DISTURBANCE OVER A SLOPING BEACH,
New York Univ., N.Y. Courant Inst. of Mathematical Sciences.
M. C. Shen.
Report No. IMM-NYU 342, NR 062-160, July 1965. 47 p, 4 fig, 12 ref, 2 append. ONR Nonr-285 (55), NSF-GP-3465.

Descriptors: *Coasts, *Beaches, *Waves (Water), Equations, *Shallow water, Pressure, Equilibrium.
Identifiers: Steady state problem, Transient problem.

Two-dimensional water waves generated by a prescribed pressure disturbance on the equilibrium surface of a uniformly sloping beach is studied by means of the Laplace transform technique applied to the equations of the linear theory. Both transient and steady problems are considered, and in each case the problem reduces to solving an inhomogeneous q-difference equation. The arbitrary constants in the solutions of the transient and the steady-state problem are determined by respectively imposing a boundedness condition and a radiation condition at infinity. The example of an oscillatory point pressure acting on the equilibrium surface of a 45 degree beach is worked out in

detail. It seems easier to derive the steady-state solution from the transient problem than to find it directly. (Sinha-OEIS)
W74-02187

INPUT SPECIFICATIONS TO STOCHASTIC DECISION MODELS,
Arizona Univ., Tucson. Dept. of Systems Engineering.
D. M. Clainos.
Available from NTIS as PB-226 091 $6.00 in paper copy, $1.45 in microfiche. M S Thesis, May, 1972. 60 p, append. OWRR A-024-ARIZ (8). 14-31-0001-3503.

Descriptors: *Decision making, *Stochastic processes, *Synthetic hydrology, Model studies, Mathematical models, Streamflow.
Identifiers: *Streamflow synthesis, Conditional dependency, Discrete matrices.

The use of discrete conditional dependency matrices as input to stochastic decision models is examined. Some of the problems and initial assumptions involved with the construction of the matrices are discussed. Covered in considerable detail is the transform used to relate the gamma space with the normal space. A new transform is introduced that should produce reasonable results when the record of streamflows (data) has a highly skewed distribution. Finally, the possibility of using the matrices to provide realistic inputs to a stochastic dynamic program is discussed.

ULTRASONIC RIVER FLOW MEASUREMENT,
Atomic Energy Research Establishment, Harwell (England).
W. R. Loosemore.
Ultrasonics, Vol 11, No 5, p 195-196, September 1973. 2 fig.

Descriptors: Flow measurement, *Flowmeters, *River flow, *Flow rates, *Instrumentation, *Ultrasonics, Automatic control, Data processing, Computers, Gages, Foreign research, Europe, Monitoring.
Identifiers: *United Kingdom (Thames River).

A brief description is given of a new ultrasonic flowmeter which measures total flow rates in rivers directly, automatically, and continuously. Measurements are made at preselected intervals, normally every 15 min, and the result is displayed locally in numerical form and then transferred to punched paper tape for computer input. Water level data, measured concurrently by a resistance gage, are automatically combined with the ultrasonically determined velocity to compute volume flow rates. The device was developed by the British Water Resources Board (WRB) and Atomic Energy Research Establishment. It was first installed in January 1973 at Clifton Reach on the Thames in cooperation with the Thames River Conservancy. (Brown-IPC)

MAPPING AVERAGE ANNUAL SURFACE WATER RESOURCES OF THE HYDROLOGICAL REGIONS OF NELSON, NEW ZEALAND,
Ministry of Works, Nelson (New Zealand). Water and Soil Div.
F. Scarf.
Journal of Hydrology (New Zealand), Vol 11, No 2, p 105-126, 1972. 7 fig, 2 tab, 8 ref, 3 append.

Descriptors: *Mapping, *Data collections, *Hydrologic data, Water resources, Water yield, Stream gages, Streamflow forecasting.
Identifiers: *New Zealand (Nelson).

A method for mapping average annual water resources is based on the hydrological region concept. River gaging data from temporary sites are correlated with concurrent data from representative basins or other long-term recording sites. A comparison is made between results obtained using a simple water balance approach and those obtained by gaging and correlation. Use of the correlation equations for evaluating other flow characteristics such as minimum flow and flow duration for previously ungaged sites is discussed briefly. The average annual pattern of surface water resources for the Nelson district, New Zealand, is presented using this method. (Knapp-USGS)
W74-02290

RIVER REGIMES IN IRAN,
Durham Univ. (England). Dept. of Geography.
P. Beaumont.
Durham University Department of Geography Occasional Publications (New Series), No 1, 1973. 29 p, 11 fig, 2 tab, 23 ref.

Descriptors: *Streamflow, *Flow rates, *Hydrologic data, Foreign countries, *Drainage area, Topography, Rainfall-runoff relationships, Hydrographs, Correlation analysis, Mountains, Snowmelt, Reviews, Evaluation.
Identifiers: *Iran, River regimes.

The drainage systems of Iran can be divided into Caspian Sea drainage, Persian Gulf drainage and drainage into the central part of the country. The first and last regions are areas of interior drainage. Winter is the rainy season in Iran, during which period at least two-thirds of the country receives more than half its annual precipitation total. The regime hydrographs of 45 rivers reveal marked similarities, with peak discharges occurring mainly in the period Esfand through Ordibehesht (March through May), owing largely to the effect of snowmelt. Analysis of the river regimes broad hydrographic regions which differ from the three major groupings based on direction of drainage. The largest runoff values per unit area occur in the northern and central parts of the Zagros Mountains and in the Elburz Mountains. The lowest runoff values are in a belt around the desert regions of central Iran. (Woodard-USGS)
W74-02298

SURFACE AND INTERNAL WAVES, (POVERKHNOSTNYYE I VNUTRENNIYE VOLNY),
Akademiya Nauk URSR, Sevastopol. Marine Hydrophysics Inst.
L. V. Cherkesov.
Izdatel'stvo 'Naukova Dumka', Kiev, 1973. 248 p.

Descriptors: *Waves (Water), *Internal waves, *Gravity waves, *Ocean waves, *Tsunamis, Energy, Celerity, Viscosity, Density, Pressure, Atmospheric pressure, Depth, Surfaces, Interfaces, Ice-water interfaces, Ice cover, Fluid mechanics, Curves, Equations, Investigations.
Identifiers: USSR, *Surface waves.

Theoretical studies were made of surface and internal gravity waves generated by impulsive, periodic, and traveling disturbances. Examined are tsunami waves caused by submarine earthquakes, internal waves produced by periodic and traveling atmospheric pressures in a continuously stratified sea, and effects of viscosity and discontinuity of density at the water-ice interface on gravity waves. (Josefson-USGS)
W74-02299

PROBABILITY ANALYSIS IN AN APPROXIMATE THEORY OF MOVEMENT OF WATER MASSES, (VEROYATNOSTNYY ANALIZ V PRIBLIZHENNOY TEORII PEREMESHCHENIYA VODNYKH MASS),
Tomsk State Univ. (USSR).
D. A. Burakov.
Meteorologiya i Gidrologiya, No 4, p 52-58, April 1973. 2 fig, 8 ref.

Descriptors: *Statistical methods, *Frequency analysis, *Probability, *Distribution, Variability, Curves, Equations.
Identifiers: USSR, *Traveltime, Pearson distributions.

The probabilistic approach was applied to an interpretation and determination of traveltime. The traveltime curve, which is widely used in flood hydrograph computations, can be considered as a probability density function of traveltime of a volume element of water. To analytically express a traveltime curve, distribution curves of random variables, such as the curve for the Pearson Type III distribution, can be used. The shape of the traveltime curve is determined by statistical parameters which have a clear physical meaning. (Josefson-USGS)

COMPUTER SIMULATION OF STORM WATER RUNOFF,
Northwestern Univ., Evanston, Ill. Technological Inst.
F. F. Offner.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY12, Paper 10216, p 2185-2194, December 1973. 4 fig, 5 ref.

Descriptors: *Computer programs, *Rainfall-runoff relationships, *Urban hydrology, *Storm runoff, Urban runoff, *Simulation analysis, Rational formula.

A computer program eliminates most of the intuition or experience required in calculating stormwater runoff by the classical rational method. The program gives an approximate solution of the partial differential flow equation over the area. The area considered is divided into a grid of squares, with the elevation and soil condition (flow coefficient, initial surface retention, infiltration rate) tabulated for each grid element; often all these may be considered constant except elevation. Typical rainfall data are entered, and the program gives the runoff into drainage lines as a function of time. Depth of water standing in the area is also computed. Copies of the program are available. (Knapp-USGS)

DAMPING OF WATER WAVES OVER POROUS BED,
Massachusetts Inst. of Tech., Cambridge. Ralph M. Parsons Lab. for Water Resources and Hydrodynamics.
P. L-F. Liu.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY12, Paper 10218, p 2263-2271, December 1973. 1 tab, 14 ref, append.

Descriptors: *Waves (Water), *Porous media, *Alluvial channels, Viscosity, Sands.
Identifiers: *Damping (Water waves).

Based on linearized Navier-Stokes equations and Darcy's equations, the viscous damping of small amplitude surface waves over a permeable bed is examined. Boundary layer approximation is employed to solve the velocity field and pressure

field. By requiring that the net dissipation per period must be balanced by the slow decay of wave energy, the damping rate is found. Theory agrees fairly well with experimental results. The damping rate of a simple harmonic gravity wave over a permeable bed was studied using the boundary layer approximation. There are two possible modes of oscillation. If the porosity term is neglected, then there is only one possible mode of oscillation which is the same as that of a progressive wave over an impermeable bed. (Knapp-USGS)

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR URBAN STUDIES IN THE HOUSTON, TEXAS METROPOLITAN AREA, 1971,
Geological Survey, Austin, Tex.
D. E. Ferguson.
Open-file report (Texas District), May 1973. 244 p, 16 fig, 14 tab, 2 ref.

Descriptors: *Urban hydrology, *Hydrologic data, *Storm runoff, *Rainfall-runoff relationships, *Texas, Cities, Watersheds (Basins), Basic data collections, Streamflow, Gaging stations, Flow rates, Reservoir storage.
Identifiers: *Houston (Tex).

Hydrologic investigations of urban watersheds in Texas were begun by the U.S. Geological Survey in 1954. This report, the eighth in a series of reports to be published annually, presents the basic hydrologic data collected in the Houston urban area for the 1971 water year (October 1970 to September 1971). Rainfall for the year was unevenly distributed over the area. Individual station totals ranged from 29.2 inches at the Sims Bayou at Hiram Clarke Street gage to 49.8 inches at the Houston-Alief rain gage. The largest amounts of rainfall for an individual storm were 7.15 inches at the Houston-Alief rain gage and 6.25 inches at the Stafford rain gage on October 11. Runoff data are based on discharge measurements and stage records at 16 continuous-record stream-gaging stations, 16 partial-record stream-gaging stations, and two reservoir-content stations. Annual records of daily discharges at continous-record stream-gaging stations, maximum discharge at crest-stage partial-record stations, and daily contents of reservoirs are given. The high-runoff periods of the 1971 water year occurred during October 1970, and August and September 1971. Only a small amount of runoff resulted from rainfall during the intervening months. (Woodard-USGS)

CALIFORNIA HIGH WATER, 1970-1971,
California State Dept. of Water Resources, Sacramento. Div. of Resources Development.
D. E. Martfeld, and W. A. Arvola.
Available from State of Calif., Dept. of Water Resources PO Box 388, Sacramento, Calif. 95804, Price $2.00. Bulletin No 69-71, September 1972. 51 p, 22 fig, 3 tab.

Descriptors: *Water resources, *Weather patterns, *Hydrologic data, *Peak discharge, *California, Precipation (Atmospheric), Streamflow, Runoff, Floods, Rainfall, Snow, Flood control, Reservoirs, Water levels, Discharge (Water), Stage-discharge relations.

The weather pattern in California for water year 1970-71 was marked by extremes that set several weather records. The year held the wettest November for San Francisco and Stockton, the longest winter drought at Red Bluff, the heaviest 24-hour rainfall in southern California, and the deepest snowpack at Norden in December and January. A series of storms hit the North Coastal Hydrographic Area from October through December, causing flood stages on some rivers. The San Francisco Bay Hydrographic Area was drenched by November storms that dropped almost three inches of rain on San Francisco and more than 4 iches of rain on Marin County in one 2-day period. Heavy local runoff resulted in both areas, with the Napa River near St. Helena rising 9 feet in 9 hours. No streams exceeded flood stage. November and December were very wet months in the Central Valley Hydrographic Area and large amounts of snow were deposited in the Sierra Nevada in December. The Central Valley had little rain from January to March, when a new series of storms brought heavy rain to the mountains. Both Shasta and Oroville Reservoirs prevented downstream flooding. In February a severe earthquake centered in San Fernando Valley extensively damaged the Upper and Lower San Fernando Dams. (Woodard-USGS)
W74-02474

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR LITTLE ELM CREEK, TRINITY RIVER BASIN, TEXAS, 1971,
Geological Survey, Austin, Tex. Water Resources Div.
B. B. Hampton.
Open-file report (Texas District), July 1973. 47 p, 2 fig, 2 tab.

Descriptors: *Hydrologic data, *Small watersheds, *Texas, *Erosion control, Basic data collections, Rainfall-runoff relationships, Streamflow, Flow rates, Gaging stations Rain gages, Storms.
Identifiers: *Trinity River basin (Tex.), Little Elm Creek (Tex), Aubrey (Tex.).

The U.S. Soil Conservation Service is actively engaged in the installation of flood- and soil-erosion reducing measures in Texas. Hydrologic investigations of small watersheds were begun by the Geological Survey in 1951 and are now being made in 12 areas. This report, which is the 12th in a series of basic-data reports published annually for the Little Elm Creek study area, contains the rainfall, runoff, and storage data collected during the 1971 water year for the 75.5-square-mile area above the stream-gaging station Little Elm Creek near Aubrey, Texas. The locations of floodwater-retarding structures and hydrologic-instrument installations in the area are shown. Sixteen floodwater-retarding structures have a combined capacity of 12,340 acre-feet below the emergency spillway and control runoff from 35.7 square miles, or 47% of the area above the Aubrey stream-gaging station. Average rainfall during the 1971 water year was 24.52 inches, or 67% of the 15-year (1957-71) average of 36.55 inches for the area. The yearly mean discharge at the stream-gaging station near Aubrey was 3.89 cfs. The runoff for the year was 2,810 acre-feet (0.70 inch). (Woodard-USGS)
W74-02477

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR CALAVERAS AND ESCONDIDO CREEKS, SAN ANTONIO RIVER BASIN, TEXAS, 1971,
Geological Survey, Austin, Tex. Water Resources Div.
R. D. Steger.
Open-file report (Texas District), 1973. 74 p, 3 fig, 4 tab.

Descriptors: *Hydrologic data, *Small watersheds, *Erosion control, *Texas, *Rainfall-runoff relationships, Storms, Flood control, Soil conservation, Data collections, Flood protection, Engineering structures, Hydrographs, Mass curves, Rain gages, Gaging stations.
Identifiers: *San Antonio River basin (Tex), Calaveras Creek, Escondido Creek.

The U. S. Soil Conservation Service is actively engaged in the installation of flood and soil-erosion reducing measures in Texas. As part of this project, hydrologic investigations of small watersheds were begun by the Geological Survey in 1951 and are now being made in 12 study areas. The mean rainfall in the Calaveras Creek study area for the 1971 water year was 20.58 inches, or 75% of the 17-year (1955-71) average. The mean annual rainfall (1931-60) at the NationalWeather Service at Karnes City is 31.93 inches. The average rainfall over the Escondido Creek study area for the 1971 water year was 19.59 inches. Only one storm was selected for detailed computations. These computations include detailed time breakdown of rainfall and discharge. Hydrographs and mass curves are drawn for illustrations. A summary of rainfall-runoff data for the storm is shown. (Woodard-USGS)

FLOODS AT MARTINSBURG AND VICINITY, WEST VIRGINIA,
Geological Survey, Washington, D.C.
G. S. Runner, and E. A. Friel.
Hydrologic Investigations Atlas HA-427, 1 sheet, 1973. 8 fig, 1 map, 2 ref.

Descriptors: *Floods, *Flood data, *West Virginia, Hydrologic data, Historic floods, Streamflow, Runoff, Flow rates, Gaging stations, Peak discharge, Flood profiles, Flood frequency, Maps, Planning, Land use, Aerial photography, Appalachian Mountain Region.
Identifiers: *Martinsburg area (W Va).

This one-sheet atlas was prepared to further the objectives of the Appalachian Regional Commission. It presents hydrologic data concerning the extent, depth, and frequency of flooding that are useful for an appraisal of the hazards involved in occupancy and development of flood plains along Opequon and Tuscarora Creeks in the vicinity of Martinsburg, West Virginia. It will aid those who are responsible for making decisions for the safe and economical use of floodplain lands along these creeks. The data will be useful for preparing building and zoning regulations, developing recreational areas, and purchasing and developing unoccupied land for various uses. The map and flood data provide a technical basis for making decisions leading to land uses compatible with the degree and frequency of flooding expected. The approximate boundaries of inundation on Opequon and Tuscarora Creeks by hypothetical floods having recurrence intervals of 5,25, and 50 years are delineated on an aerial photomosaic map. Depths of inundation and limits of overflow of floods of various magnitudes can be estimated by using the methods and relations presented. (Woodard-USGS)

FLOOD CONTROL PROJECT MAINTENANCE AND REPAIR--1970 INSPECTION REPORT,
California State Dept. of Water Resources, Sacramento.
J. F. Wright, Jr., and J. MacClanahan.
Available from State of Calif, Documents Section, P.O. Box 20191, Sacramento, Calif. 95820 Price $2.00. Bulletin No 149-70, May 1971. 30 p, 2 fig, 8 tab.

Descriptors: *Flood control, *Levees, *River basins, *California, Engineering structures, Maintenance, Channel improvement, Check structures, Flood protection, Maps, Sites, Erosion control, Vegetation, Projects, Network design.
Identifiers: *Sacramento and San Joaquin Valleys (Calif.).

In 1970, flood control levees extending 1,537 miles were operated under cooperative state and federal agreements in the Sacramento and San Joaquin Valleys and in Lake and Placer Counties, Calif. Flood control projects include the Sacramento, American, San Joaquin, Calaveras, and Truckee Rivers; Littlejohns and Middle Creeks; Merced County Stream Group; Sacramento River Bank Protection Project, and the Lower San Joaquin Flood Control Project; and the Fresno County Stream Group. Twice during 1970, Department of Water Resources specialists rated the quality of levee maintenance performed by local maintaining agencies. This bulletin reports both the 1970 ratings and the method of rating, discusses proper maintenance procedures, and reports levee construction by the U. S. Army Corps of Engineers, channel maintenance, applications for levee encroachments, and the condition of the flood control project structures. Maps locate project levees and local maintenance agencies. (Woodard-USGS)

WATER RESOURCES OF THE BIG SIOUX RIVER VALLEY NEAR SIOUX FALLS, SOUTH DAKOTA,
Geological Survey, Washington, D.C.
D. G. Jorgensen, and E. A. Ackroyd.
Available from GPO, Washington, DC 20402 Price $2.05 (paper copy). Water-Supply Paer 2024, 1973. 50 p, 22 fig, 6 tab, 27 ref.

Descriptors: *Water resources, *Hydrologic data, *Surface waters, *Groundwater resources, *South Dakota, Hydrogeology, Aquifer characteristics, Water wells, Withdrawal, Water yield, Water quality, Streamflow, Base flow, Water supply, Projections, Model studies, Surface-groundwater relationships.
Identifiers: *Big Sioux River Valley (S Dak), *Sioux Falls (S Dak).

The major sources of water in the Big Sioux River Valley between Sioux Falls and Dell Rapids, S. Dak., are the Big Sioux River and the glacial outwash aquifer beneath the flood plain. The river and the aquifer are hydraulically connected. To evaluate the importance of the aquifer in the hydrologic system, both an electrical analog and a digital model were programmed for storage depletion alone. These models were used to determine the water-level declines in the aquifer that would result from 1 year of withdrawal at a rate of 9-10 million gallons per day. Both models indicated that the existing well field can yield water at that rate for more than 1 year. The analog model was also used to determine the maximum average daily yield of the aquifer-river system for a 2-year period modeled for the minimum recorded stream discharge and for streambed infiltration as the only recharge. The maximum average yield under these conditions would be less than 24 mgd. Most of the water pumped during this period would be from aquifer storage. Water from the river is generally less mineralized, softer, and easier to treat than groundwater. Water pumped from wells near the river is similar in quality to the river water, but does not have the objectionable odors or tastes often present in water from the river. (Woodard-USGS)

DETAILED ANALYSIS OF SHORT-TERM VARIATIONS IN BEACH MORPHOLOGY (AND CONCURRENT DYNAMIC PROCESSES) FOR SUMMER AND WINTER PERIODS, 1971-1972, PLUM ISLAND, MASSACHUSETTS,
Massachusetts Univ., Amherst. Coastal Research Center.
R. W. Abele, Jr.
Available from NTIS as AD-759 513. Final Report prepared for Department of the Army, November 1972. 174 p, 59 fig, 1 tab, 23 ref. DACW72-71-C-0023.

Descriptors: *Massachusetts, *Waves (Water), *Beach erosion, Ocean waves, Atmospheric pressure, Intertidal areas, Water level, Storms, *Sediment transport, *Shallow water, *Geomorphology, Coasts, Barrier islands, *Meteorology.
Identifiers: *Plum Island (Mass), Breakers, Longshore currents, Nearshore bars, Air-sea interaction.

An analysis of the relationship between wave and meteorological variables and beach morphology was undertaken during summer and winter periods, 1971 and 1972, on Plum Island, Massachusetts. Fifteen variables were measured or computed bihourly, twenty-four hours per day, throughout both study periods. These variables were wave period, wave height, breaker type, breaker angle, longshore current velocity, wave steepness, breaker power, wind speed and direction, barometric pressure, air and water temperature, and ground-water elevation. Daily topographic maps of the intertidal zone were constructed for twelve beach profiles spaced at 60-m intervals. Variations in beach process variables, during both the summer and winter periods, were directly related to the passage of high- and low-pressure systems and to the proximity of the system to Plum Island. With an increase in breaker power and breaker steepness, the high-tide beachface gradient increased. Increases in breaker power also resulted in a rise in the level of the ground-water surface. Although most process variables operated in a similar fashion for the summer and winter periods, strong offshore winds and extreme low temperatures that accompany polar high-pressure systems are unique to the winter period. Differences in beach morphology within a small area appear to reflect the state of recovery of the beach profiles following a storm. Adjacent profiles at different stages of maturity are controlled by the proximity of the nearshore bar. The closer the bar is to shore, the more quickly sediment can be returned to the beach zone following a storm. (Sinha-OEIS)

GROUND WATER SEEPAGE PATTERNS TO WELLS FOR UNCONFINED FLOW--PHASE II,
Iowa State Water Resources Research Inst., Ames.
M. Y. Khan, and D. Kirkham.
Available from NTIS as PB-226 089 $5.50 in paper copy, $1.45 in microfiche. Completion Report ISWRRI-57, August 1973. 63 p, 12 fig, 9 tab, 22 ref. OWRR B-019-IA (5).

Descriptors: *Aquifers, *Groundwater movement, *Ditches, *Free surfaces, *Saturated flow, Model studies, Equations, Computer programs, Hydraulic conductivity, Analytical techniques.
Identifiers: *Parallel ditches, Unconfined flow, Two-dimensional groundwater mounds, Three-dimensional groundwater mounds.

Analytical methods have been developed, for steady-state unconfined flow, for determining the exact location of the free surface in a two-dimensional flow of groundwater between two parallel ditches. The analysis considers flow in a saturated region below the watertable; capillary effects are neglected. The analysis of a two-dimensional flow can be carried over to determine the location of the free surface in a three-dimensional axisymmetric flow toward a well. The solution has been obtained from potential theory by solving Laplace's equation to satisfy an appropriate set of boundary conditions using a modified Gram-Schmidt technique and a simple iterative scheme. The solution is given in the form of a potential function and

a stream function. These functions can be used to determine the exact location of the free surface and to draw flownets. Computer programs have been developed to determine the location of the free surface and to draw flownets. Several flownets are presented. (See also W70-02759) (Woodard-USGS)

STRONTIUM, CALCIUM AND THE ISOTOPIC COMPOSITION OF STRONTIUM IN UNDERGROUND WATERS FROM THE SCIOTO RIVER BASIN, OHIO,
Miami Univ., Oxford, Ohio. Dept. of Geology.
A. M. Stueber, A. D. Baldwin, M. Ikramuddin, and P. Pushkar.
Available from the National Technical Information Service as PB-226 104, $3.00 in paper copy, $1.45 in microfiche. Final Report, 1973. 38 p, 7 fig, 5 tab, 11 ref. OWRR A-030-OHIO (1). 14-31-0001-3835.

Descriptors: *Groundwater, *Isotope studies, *Strontium, *Tracers, Groundwater-surface relationships, *Ohio, Tagging, Provenance, Glaciohydrology.
Identifiers: *Scioto River basin (Ohio), Sr/Ca ratios, Celestite.

A total of 27 ground-water samples from the Scioto River drainage basin, Ohio has been analyzed for Sr and Ca concentrations and Sr-isotopic compositions. Ground waters which emanate from carbonate bedrock are characterized by 87Sr/86Sr ratios in the range 0.708-0.709; unusually high Sr/Ca ratios in these waters identify celestite lenses within the carbonate as the dominant source of Sr. Underground waters from clastic bedrock, principally shale, have 87Sr/86Sr ratios which vary from about 0.710 to about 0.713, and low Sr/Ca ratios. Thus there are two basic ground-water types from bedrock within the basin which can be identified by these two parameters. Most ground waters that have been in contact only with glacial overburden, which covers the northern two-thirds of the basin, have carbonate-type 87Sr/86Sr ratios as well as high Sr/Ca ratios. Celestite is apparently present in the till throughout much of the Scioto basin. Ground waters containing celestite-derived Sr, whether from the carbonate bedrock or the glacial overburden, have such high strontium concentrations as to completely establish the 87Sr/86Sr ratios of surface waters north of the glacial boundary and limit the usefulness of this parameter as a tracer in water studies within the basin.

THE ROLE OF DEFORMATION IN CHANGING THE RESERVOIR PROPERTIES OF AQUIFERS,
Montana Univ., Missoula. Dept. of Geology.
G. W. Crosby.
Available from National Technical Information Service as PB-226 197 $3.00 in paper copy, $1.45 in microfiche. Research Report No. 42, Montana University Joint Water Resources Research Center, Bozeman, (1973) 8 p, 3 fig. OWRR A-036-MONT (1).

Descriptors: Groundwater, *Deformation, *Aquifer characteristics, *Hydrogeology, *Groundwater reservoirs, *Montana.
Identifiers: *Sawtooth Range (Mont).

The purpose has been to quantitatively determine the role of deformation in changing the physical properties of rocks: more specifically, an attempt has been made to assess the possible damage by deformation to aquifers. The near subsurface of perhaps 25 percent of the area of the United States consists of moderate to severely deformed rocks. Moreover, much of the dry southwest is underlain by deformed strata, and lacking surface water, the location of groundwater reserves is of considerable economic importance. The investigation was undertaken in the disturbed belt adjacent to the Sawtooth Range in Montana. The disturbed belt is a transition zone from flat-lying underformed strata of the plains to severely deformed rocks of the fold and thrust belt in the Sawtooth Range. (Holje-Montana)

A CONJUNCTIVE USE SURFACE WATER--GROUND WATER SIMULATOR,
New Mexico Inst. of Mining and Technology, Socorro. Dept. of Geoscience.
W. Brutsaert, and C. Way.
Available from the National Technical Information Service as PB-226 254, $3.50 in paper copy, $1.45 in microfiche. New Mexico Water Resources Research Institute Partial Technical Completion Report No 033, November 1973. 56 p, 9 fig, 1 tab, 7 ref, append. OWRR A-045-NMEX (1).

Descriptors: *Computer models, *Aquifers, *Conjunctive use, *Computer simulation, *Groundwater flow, Groundwater recharge, Groundwater, Unconfined aquifers, Seepage, Leakage, Phreatophytes, Precipitation, Storage coefficient, Hydraulic conductivity.
Identifiers: *Rio Grande Region, *Gauss-Elimination, *Line successive over relaxation, New Mexico, Continuous and descretized mass balance, Thomas Algorithm, Residual approach.

As part of an interdisciplinary analysis of the economic evaluation of the water resources of the Rio Grande Region of New Mexico, a conjunctive use surface water-ground water simulator was developed. The simulator was used to determine the dynamic availability of ground water and its relationship to flow in the Rio Grande. The structure and use of the simulator are described. The simulator is a computer model in which the governing nonlinear parabolic partial differential equation, used to simulate unconfined aquifer flow in two dimensions, was solved by implicit finite differences. The set of difference equations in residual form are solved by the line successive over relaxation method or Gauss Elimination depending upon the size of the problem. (Welker-New Mexico)

DISPERSION OF SUBSTANCES FROM WELL RECHARGE OPERATIONS IN AN ANISOTROPIC, HOMOGENEOUS CONFINED AQUIFER,
Wisconsin Univ., Madison. Dept. of Civil and Environmental Engineering.
J. A. Hoopes, P. L. Monkmeyer, and Q. N. Fattah.
Available from the National Technical Information Service as PB-226 287, $3.50 in paper copy, $1.45 in microfiche. Wisconsin Water Resources Center, Madison, Technical Report, 1973. 52 p, 15 fig, 35 ref, 2 append. OWRR A-043-WIS (1) 14-31-0001-3550 and 14-31-0001-3850.

Descriptors: *Dispersion, *Recharge wells, *Anisotropy, Water quality, Waste water disposal, Homogeneity, *Porosity, *Aquifers, Model studies, *Groundwater movement.

The first part of the investigation concerns the development of experessions which related the dispersion coefficient for flows through anisotropic, homogeneous porous media to the fluid, flow, and media properties. These expressions are developed from one-dimensional flow experiments on an anisotropic media model constructed of thin alternating layers of different sized sand. In the second part of the study, dispersion of substances in the flow from a partially-penetrating, recharge well through a confined homogeneous, anisotropic aquifer is investigated. Theoretical distributions of a substance added to the steady flow from the well are being determined from numerical solutions of the mass conservation equation, where the flow field is determined from potential flow analysis and dispersion coefficients are obtained from the results of the first part of the investigation. Measurements of a tracer distribution will be carried out on a laboratory model, consisting of a cylindrical element of anisotropic porous media constructed as described above, and compared to the theoretical predictions. From these results, the importance of dispersion in flow through anisotropic confined aquifers will be determined, and the validity of the theoretical

model in investigating other complex well flow patterns will be evaluated.

A HYDROGEOTHERMAL DESCRIPTION OF GROUNDWATER IN UPPER CRETACEOUS DEPOSITS IN THE SOUTHEAST ARAL SEA AREA (GIDROGEOTERMICHESKAYA KHARAKTERISTIKA PODZEMNYKH VOD VERKHNEGO MELA YUGO-VOSTOCHNOGO PRIARAL'YA),
Akademiya Nauk Uzbekskoi SSR, Tashkent. Institut Seismologii.
S. E. Ergashev.
Uzbekskiy Geologicheskiy Zhurnal, No 1, p 76-78, 1973. 1 fig, 2 ref.

Descriptors: *Groundwater, *Geothermal studies, *Temperature, Thermocline, Thermal water, Borehole geophysics, Structural geology, Geologic time, Aquifers, Water quality.
Identifiers: *USSR, *Aral Sea area, *Cretaceous period, Tectonics.

Four hydrogeothermal regions southeast of the Aral Sea were identified on the basis of groundwater temperatures. The first region characterized by low temperatures (18-25 deg C) is confined to the Amu-Dar'ya arch and the Sultanuizdag-Bukantau horst anticlinal zone. The depth of groundwater occurrence is 3 to 15 m. The second region with moderately warm waters (25-30 deg C) is confined to the zone of the Buzgul'skiy arch. The third region with warm waters (28-35 deg C) belongs to the Tadzhikazganskiy Depression. The fourth region with high groundwater temperatures (28-56 deg C) is confined to the South Aral Sea Depression. The increase in groundwater temperature depends largely on depth of occurrence of water-bearing rocks and on structural and tectonic conditions of the area. The normal geothermal gradient for groundwater of the area is 3.0-3.5 deg C per 100 m in peripheral sections and 4.5-5.0 deg C in central parts. Thermal water of the South Aral Sea Depression can be used to heat greenhouses, schools, hospitals, and other buildings. (Josefson-USGS)

GROUNDWATER RESOURCES OF VAL VERDE COUNTY, TEXAS,
Geological Survey, Austin, Tex.
R. D. Reeves, and T. A. Small.
Texas Water Development Board Report 172, June 1973. 144 p, 18 fig, 7 tab, 50 ref.

Descriptors: *Groundwater resources, *Water wells, *Aquifer characteristics, *Water utilization, *Texas, Well data, Water yield, Water levels, Water quality, Chemical analysis, Hydrogeology, Groundwater movement, Surface-groundwater relationships, Streamflow, Lakes, Drillers logs, Basic data collections.
Identifiers: *Val Verde County (Tex).

The principal water-bearing unit in Val Verde County, Texas, is the Edwards and associated limestones. Nearly all of the water used in the county is obtained from groundwater sources. A total of about 1,850 acre-feet or 1.7 mgd of water was pumped from wells in 1969. About 1,200 acre-feet (1.1 mgd) was used for rural-domestic supply and livestock, about 600 acre-feet (0.5 mgd) was used for irrigation, and 50 acre-feet (0.04 mgd) was used for municipal supply. A small but undetermined amount of water was pumped for industrial use. The city of Del Rio uses water from San Felipe Springs for its municipal supply; in 1969 the city used 6,780 acre-feet (6.0 mgd). Additional large supplies of groundwater are available for development. An average of about 500,000 acre-feet per year is discharged from the Edwards and associated limestones through springs and seeps. The chemical quality of the groundwater suitable for most uses except in the extreme southeastern part of the county. (Woodard-USGS)

INFLUENCE OF SOIL STRUCTURE AND MOISTURE ON NITRIFICATION,
Komenskeho Universita, Bratislava (Czechoslovakia). Dept. of Microbiology.
L. Simon.
Acta Fac Rerum Nat Univ Comenianae Microbiol. 1 p, 87-97. 1971. Illus.
Identifiers: *Nitrification, *Soil structure, *Soil moisture, Aggregates.

The intensity of nitrification of structural aggregates of the soil depends on the size of the aggregate and the degree of moisture. Mesoaggregates of small size (0.1-1.4 mm) permit maximal nitrification. Larger mesoaggregates (2-6 mm) permit a higher degree of nitrification at all degrees of moisture than microaggregates (< 0.2 mm). At a moisture content of 40% and maximal capillary capacity, nitrification depends not so much on the size of the aggregate as on the moisture content; hence, the moisture content is the most suitable for the comparison of soil nitrification in various structures. For nitrification purposes a moisture content of 80 or 100% in the soil had adverse effects.--Copyright 1973, Biological Abstracts, Inc.

A SELF-DRAINING SUBSURFACE RAINFALL CONSERVATION SYSTEM: ITS EFFECT ON THE SOIL WATER STATUS AND PRODUCTIVITY OF COASTAL PLAINS SANDS,
Rhodesia Univ., Sailsbury. Dept. of Agriculture.
D. A. Russell.
Soil Sci. Vol 114, No 3, p 234-238. 1972. Illus.
Identifiers: *Coastal plains, Design, Rainfall, *Sands, Soil water movement, *Subsurface drainage, Trough, Water conservation.

A water control system was established to provide simultaneously for both rainfall and nutrient conservation and drainage of excess water, with the capability of providing for crop needs over the growing season. The approach adopted was to establish a perched water table, which would be self-draining to a predetermined level when the free water level rose above that mark. To achieve the desired conditions the system consisted of a U-shaped subsurface trough operated in a manner analogous in some respects to the wick-siphon principles. The structure and use of the trough are described. Laboratory and field tests were performed. By applying the principles of soil water movement to a subsurface trough design, water and nutrient conservation, and excess water drainage can be incorporated in a single practice. This reduces drought damage hazard to crops and provides a marked increase in the productivity of sandy soils.--Copyright 1973, Biological Abstracts, Inc.
W74-02193

INFLUENCE OF THE SOIL WATER LEVEL ON MICROBIAL PROCESSES OF PASTURE AND FOREST COMMUNITIES,
Komenskeho Universita, Bratislava (Czechoslovakia). Dept. of Geobotany.
A. Frano.
Acta Fac Rerum Nat Univ Comenianae Microbiol. 1 p, 39-51. 1971. Illus.
Identifiers: Cellulose degradation, *Forests, Humus, *Microbial processes (Soil), Nitrification, *Pastures, *Soil water.

The direct influence of the water level is an inhibition of soil microbiological processes and an accumulation of organic elements. Humus formation exceeds mineralization. Where the water level effects the soil profile only by the activity of capillary water attraction to the surface, microbiological processes achieve maximal intensity and nearly equivalent mineralization. The intensity of both nitrification and cellulose degradation is much higher in forest than in pasture communities, but the biologic activity of the latter is much higher.--Copyright 1973, Biological Abstracts, Inc.

FACTORS AFFECTING THE MANGANESE STATUS IN SOILS OF THE U.A.R.,
Ain Shams Univ., Cairo (Egypt). Dept. of Soils.
A. H. El-Damaty, H. Hamdi, and A. A. Orabi.
U A R J Soil Sci. Vol 11, No 1, p 7-26. 1971. Illus.
Identifiers: Calcium carbonate, *Manganese, Minerals, Nutrients, *Rice, Soils, *United Arab Republic, Waterlogging, *Soil chemical properties.

The status of available Mn, in some soils of the United Arab Republic as influenced by soil reaction, organic matter and CaCO3 contents, the mechanical components and the waterlogging was studied. The different forms studied were water-soluble, exchangeable, easily-reducible and total Mn. Water-soluble Mn was absent from all samples. Alluvial soils contain fairly high amounts of the chemically available Mn, ie., the active form which is quite sufficient to support normal plant growth. These soils are rich in total Mn because of the annual sedimentation of the solid matter transported by the Nile on to the valley. Sandy and calcareous soils contain less amounts of active and total Mn than do the typical alluvial soils. The ratio of active to total Mn is less in these soils than in the alluvial ones. Highly significant positive correlation was observedbetween each of the different forms of Mn and the organic matter content, silt percentage and clay percentage. The organic matter exerted the greatest influence on active Mn as the correlation coefficient reached 0.76. A highly significant negative correlation was observed between the different forms of Mn and the soil pH value, in spite of the narrow range in which these values lie. After the selected soils were exposed to continuous waterlogging for 45 days the exchangeable Mn was almost doubled. The water-soluble form, which was absent before waterlogging, reached 4 ppm in some cases. The easily-reducible form also increased. The dry matter yield of rice plants grown on submerged soil was higher than on the unsubmerged ones. Mn concentration in rice plants as well as their total Mn content increased due to continuous waterlogging.--Copyright 1973, Biological Abstracts, Inc.

MIGRATION OF SUBSTANCES WITH SURFACE AND GRAVITATIONAL WATERS IN SOILS OF GEOCHEMICALLY RELATED LANDSCAPES OF BARABA, (MIGRATSIYA VESHCHESTV S PVERKHNOSTNYMI I GRAVITATSIONNYMI VODAMI V POCHVAKH GEOKHIMICHESKI SOPRYAZHENNYKH LANDSHAFTOV BARABY),
Akademiya Nauk SSSR, Moscow. Pochvennyi Institut.
N. I. Bazilevich, and V. M. Kurachev.
Pochvovedeniye, No 11, p 3-16, 1972. 6 tab, 8 ref.

Descriptors: *Saline soils, *Salts, Movement, *Surface waters, *Gravitational water, Groundwater, Soil types, Soil groups, Soil horizons, Soil profiles, Bogs, Inorganic compounds, Leaching, Water table, Lysimeters.
Identifiers: *USSR (Baraba Lowlands), Solonetzes, Solods, Solonchaks.

Investigations were carried out in the northern part of the Chany Depression in the Baraba Lowland to study movement of chemical substances in solonetzic, solodized, and bog soils on runoff plots and in open lysimeters. Seasonal migration of salts and desolonetzization of the B horizon were established together with solodization of the A and B1 horizons (migration of SiO2, R203, C, and suspensions), and silicification and leaching of suspensions and R203 into the B2 or B/C horizons. A part of the salts, mineral substances, and C were leached into groundwater in the solodized soils. (Josefs[illegible]USGS)

Identifiers: *USSR (North Caspian Sea region), *Solonetzes, *Solonchaks.

To study water regime of Solonchak Solonetzes in open areas of forests in the semidesert of the North Caspian Sea region, investigations were carried out on virgin Solonchak Solonetz and on dark-colored soil of sinks (1966-69), and on Solonetzes in openings between trees planted in 1952 (1963-68). Soil moisture content was determined to the rooting depth monthly during the growning season and to the water table in spring and autumn. Additional wetting through accumulation of snow on open areas produced a radical change in the water regime of Solonchak Solonetzes, resulting in desalinization and desolonetzization of these soils. An increase in wetting depth and soil water storage in spring contributed to growth of a luxuriant grass cover on Solonetzes in open areas. Depth of rooting of well-developed plants and depth of soil drying were greater in the open than in virgin Solonetz. Water loss from open areas during a growing season exceeded that from virgin Solonetzes by a factor of 1.5-3 and approached the amount of water lost by steppe vegetation of sinks. (Josefson-USGS)

MOISTURE REGIME OF SOUTHERN CHERNOZEM WITHIN SHELTERBELTS, (REZHIM VLAZHNOSTI YUZHNOGO CHERNOZEMA V SISTEME LESNYKH POLOS),
Tomsk State Univ. (USSR). Kafedra Pochvovedeniya i Agrokhimii.
V. D. Konstantinov.
Pochvovedeniye, No 11, p 56-67, 1972. 3 fig, 2 tab, 16 ref.

Descriptors: *Soil moisture, *Soil water movement, *Chernozems, *Shelterbelts, *Trees, Snowpacks, Water storage, Water balance, Water loss, Curves.
Identifiers: Chronoisopleths, *USSR (Kokchetav Oblast).

To study the effect of shelterbelts on items in the water regime of soil, investigations were carried out in 1967-69 on southern calcareous Chernozems in the Ubogan-Ishim watershed in western Kokchetav Oblast. Effectiveness of shelterbelts in North Kazakhstan should be evaluated from the standpoint of their environmental effects in winter and early summer. The effect of shelterbelts on soil moisture conditions varies areally and is most beneficial at a distance of 30-50 m from the forest edge. Soil moisture conditions in shelterbelts are optimal in April-May or April to early June, after which they deteriorate rapidly. By mid-June soil moisture in the root zone is usually exhausted. During and after this period trees draw their water from atmospheric precipitation and from deeper soil layers. Moisture exchange under trees is active to a depth of 1.5-2 m and is still significant to a depth of 2.5-3 m and even 4 m in some years. Moisture in these deeper soil layers plays an important role in the water regime of Chernozems located within shelterbelts. (Josefson-USGS)

Pochvovedeniye, No 11, p 125-131, 1972. 4 fig, 13 ref.

Descriptors: *Soil physics, *Moisture content, *Dispersion, *Films, *Surfaces, Particle size, Quartz, Curves, Equations.
Identifiers: USSR, Disperse systems, *Moisture potential.

The relation between moisture potential and 'reduced film thickness' can be considered unique for disperse systems with different specific surfaces provided numerical values of the specific surfaces of systems exceed 100 sq m/g. Curves of this relation for disperse systems with smaller specific surfaces can be found from data on particle-size distribution using the proposed computation method. Theoretical cuves of the relation, constructed according to the proposed method, agree well with experimental data obtained for quartz powder separates with different specific surfaces. AN AIRBORNE GAMMA SURVEY OF MOISTURE CONTENT IN THE SURFACE DETENTION LAYER, (SAMOLETNAYA GAMMA--S'YEMKA ZAPASOV VLAGI V SLOYE POVERKHNOSTNOGO ZADERZHANIYA),
Institut Prikladnoi Geofiziki, Moscow (USSR).
A. V. Dmitriyev, R. M. Kogan, and Sh. D. Fridman.
Meteorologiya i Gidrologiya, No 4, p 64-76, April 1973. 3 tab, 19 ref.

Descriptors: *Soil moisture, *Moisture content, *Storage, *Remote sensing, *Gamma rays, Surveys, Aircraft, Radiation, Radioactivity, Radioisotopes, Snowmelt, Precipitation (Atmospheric), Equations.
Identifiers: *USSR (Shelon' River basin).

Estimates of surface detention storage in the Shelon' River basin were based on an airborne gamma survey performed on May 5-19, 1965, over test strips designed for studying accuracy of snow-water equivalent measurement using airborne gamma techniques. Measurements were made over 5 test strips which differed in land use, soil type, and character of relief. To obtain a recording of the gamma field, flights were made over all strips in the fall of 1965 (October 8-11). Water storage on the surface in May 1965 was considerably greater than in October. On four strips the moisture excess was about 10 mm and on one strip it was about 20 mm. No temporary accumulation of water on the surface was observed in May or October. The constancy of magnitude of the gamma field in May and October indicates steady-state moisture conditions in the soil and on the surface during each of these periods. (Josefson-USGS)

SATURATED-UNSATURATED SEEPAGE BY FINITE ELEMENTS,
Volcani Inst. of Agricultural Research, Bet-Dagan (Israel). Dept. of Soil and Water.
S. P. Neuman.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY12, Paper 10201, p 2233-2250, December 1973. 9 fig, 19 ref, 3 append.

Descriptors: *Seepage, *Saturated flow, *Unsaturated flow, *Finite element analysis, Soil water movement, Groundwater movement, Simulation analysis, Porous media.

A Galerkin-type finite element method is given to solve the quasilinear partial differential equations of transient seepage in saturated-unsaturated porous media. The resulting computer program is capable of handling nonuniform flow regions having complex boundaries and arbitrary degrees of local anisotropy. Flow can take place in a vertical plane, in a horizontal plane, or in a three-dimensional system with radial symmetry. An arbitrary number of seepage faces can be considered simultaneously, and the positions of the exit points on these boundaries are adjusted automatically during each time step. Two examples, one of seepage through an earth dam with a sloping core and horizontal drainage blanket, and the other of seepage through a layered medium cut by a complex topography, are included. These examples indicate that the classical concept of a free surface is not always applicable when dealing with transient seepage through soils. (Knapp-USGS)

GENERAL SOILS STUDY: PEARL RIVER, HANCOCK, HARRISON COUNTIES, MISSISSIPPI.
Soil Conservation Service, Gulfport, Miss.

Prepared for The Gulf Regional Planning Commission, Gulfport, Mississippi, 1972. 132 p, 2 fig, 23 tab.

Descriptors: *Gulf coastal plain, *Comprehensive planning, *Data collections, *Soil surveys, Soil types, Mapping, Soil physical properties, *Mississippi, Soil properties, Soil classification, Soil analysis.

The Gulf Regional Planning Commission, which serves the southeastern part of Mississippi, studied the soil types in its jurisdiction and the suitability of each soil for various uses. Twenty-three different types of soil are described, and these form 22 different soil associations. Each soil type is analyzed under the following characteristics: (1) soil properties, including water table depth, percolation rate, depth to hard rock, flood hazard, and thickness and texture of soil horizons; (2) stability of the soil for various engineering uses; (3) limitations for some urban uses; (4) suitability for cropland, pasture and woodland; (5) suitability for horticultural plants; and (6) limitations for recreational use. Maps of the distribution of each soil type are also included. (Poertner)

EVALUATION OF SOIL MOISTURE REGIME IN A WATERSHED,
New Brunswick Univ., Fredericton.
K. S. Davar, and D. J. Calkins.
In: Papers, International Symposium on Water Resources Planning, Mexico City, Mexico Volume III, December 1972, 20 p, 3 fig, 3 tab, 2 ref.

Descriptors: *Soil moisture, *Soil moisture meters, Soil water, Moisture content, Nuclear moisture meters, Subsurface waters, Networks, Data collections, Hydrologic data, Stations, Statistics, Streamflow, *Canada, Watershed management.

The type of hydrologic response that occurs at any time in a watershed depends largely on the actual prevailing soil moisture regime. The determination of soil moisture content has been facilitated by the commercial availability of the neutron-scattering depth probe. A methodology is presented for the evaluation of watershed soil moisture regimes. Although demonstrated on a region in New Brunswick, Canada, it can be an especially important factor in areas with generally low soil moisture, where small changes in such moisture reflect a significant change in the response system. It was observed that data at each station were from different populations, and that strong correlations existed between most of the stations in representing soil moisture regime changes in relation to streamflow. ON SOLVING THE UNSATURATED FLOW EQUATION: THE FLUX-CONCENTRATION RELATION,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia).
J. R. Philip.
Soil Science, Vol 116, No 5, p 328-335, November 1973. 3 fig, 24 ref.

Descriptors: *Unsaturated flow, *Soil water movement, *Equations, Mathematical studies, *Soil moisture, Infiltration, Sorption.
Identifiers: Flux concentration.

The flux concentration relation expresses in reduced form the dependence of flux density on moisture content during various unsteady flow phenomena in unsaturated soils. The general properties of the flux concentration were established for various phenomena: one-dimensional sorption and infiltration with constant concentration conditions and one-dimensional sorption (for the linear soil only) with constant and variable flux and variable concentration conditions. The flux concentration is independent of time for some phenomena and it varies only mildly with time for some others; and, for some phenomena, the dependence of flux concentration on the shape of the moisture diffusivity function lies within fairly narrow bounds, which are fixed by reference to the extreme cases of the delta-function and the linear soil. This relative stability makes it a useful aid to the study of methods of solving the unsaturated flow equation. An appendix demonstrates that the approximation of step function moisture profiles implies a delta function moisture diffusivity function. (Knapp-USGS)
W74-02464

ON THE CONCEPT AND DETERMINATION OF CRITICAL SOIL MOISTURE,
M. Gracanin.
Acta Bot Croat. 31. p 181-188, 1972.
Identifiers: *Soil moisture, *Reviews, *Wilting point, Inert water.

A review of literature on the determination of permanent wilting coefficient or wilting point is given. Inert water (Iv) values determined in the laboratory were highly dependent on the amount of rooting throughout the soil. Lower Iv values were generally obtained from soils with more roots. This limitation occurs especially in heavy colloid-rich soil with slow movement of capillary water. In determination of critical water content in the field these factors are more strongly expressed. The following are differentiated: 'the soil capacity for inert water' or the real critical moisture determined by the moisture at which the absorptive powers of soil and the plant are in equilibrium; 'critical field moisture' (Vkp)/or the moisture of the rhizosphere at which plants cannot supply themselves in time with ecologically active water due to slow movement of capillary water; and 'apparent critical field moisture' (Avkp) determined by the disproportion of transportation rate in the conducting vessels of the plant and of transpiration intensity. Although Iv is relatively constant,

Vkp is dependent on soil texture and structure, root net architecture, and longitudinal growth of the root, plant species and developmental phase. Avkp is relatively independent of soil moisture, but depends on the capacity of the plant to regulate water transportation and transpiration rates.--Copyright 1973, Biological Abstracts, Inc.

WATER RESOURCES OF THE SKOKOMISH INDIAN RESERVATION, WASHINGTON,
Geological Survey, Tacoma, Wash.
D. Molenaar, and J. E. Cummans.
Open-file report, 1973. 58 p, 6 fig, 15 tab, 10 ref, append.

Descriptors: *Water resources, *Surface waters, *Groundwater resources, *Indian reservations, *Washington, Hydrologic data, Streamflow, Flow rates, Water wells, Aquifer characteristics, Water yield, Water quality, Tidal effects, Saline water intrusion, Estuaries, Well data, Drillers logs, Water level fluctuations, Water temperature, Flood plains, Water analysis, Chemical analysis, Data collections, Floods.
Identifiers: *Skokomish Indian Reservation (Wash).

The 7.5-square-mile Skokomish Indian Reservation in central Mason County, Washington, has an abundant supply of good quality surface water from the Skokomish River for use in a potential fish hatchery or other aquaculture facility. The average flow of the river at the reservation for the period 1944-71 was about 540,000 gpm; the greatest flow was about 12.1 million gpm and the smallest flow was about 56,100 gpm. Saline water from Hood Canal moves upstream less than a mile in the tidal reach of the Skokomish River. The flood of January 20-21, 1972, with a flow of about 8.3 million gpm, covered a large part of the flood plain, where many homes are situated; a flood of this size occurs, on the average, every 4 years. Several small streams flow eastward across the reservation into Hood Canal. Some of these streams dry up in the summer but others flow the year round. Water from wells is obtained mostly at depths less than 70 feet. Wells generally are used for domestic supplies, and pump yields are 5-10 gpm. Seasonal fluctuations of water levels in wells range from less than a foot to about 4 feet. The water is of good chemical quality. (Woodard-USGS)

ON THE VARIATION OF SALINITY DISTRIBUTION IN A RESERVOIR, SITUATED IN RECLAIMED LAND, (JAPANESE),
Saga Univ. (Japan). Lab. of Shore Reclamation.
K. Watanabe, and K. Hasegawa.
Agric Bull Saga Univ. 32. p 97-106. 1972. Illus. (English summary).
Identifiers: Irrigation water, *Reclaimed land, Reservoirs, *Salinity distribution, Wind.

In a reservoir, situated in reclaimed land, it takes about a year after construction for salinity to decrease within the limit of allowable irrigation water, and then salinity occurs periodically. A long-term observation was carried out in order to determine the mechanism of variation of salinity in a reservoir. The freshening process is divided into a period of replacement of sea water by fresh water and a period of variation of salinity. A large-scale reservoir has a strong tendency for 2-layer stratified flow with dense salt water at the bottom. A small-scale reservoir has good vertical diffusion because of the small difference of density between the 2 layers. In the period of the variation of salinity the salt inflow by ground water must be considered. Wind strongly affects the vertical distribution of salinity, and the critical velocity of wind is related to the depth of fresh water in a reservoir. A reservoir should be located in the lowest reaches of reclaimed land, some distance away from a sea dike in order to check the intrusion of sea water.--Copyright 1973, Biological Abstracts, Inc.

ADJUSTMENT OF FRICTION IN HYDRAULIC MODELS OF LAKES,
Worcester Polytechnic Inst., Mass. Alden Research Labs.
J-C. Shiau, and R. R. Rumer, Jr.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY12, Paper 10222, p 2251-2262, December 1973. 2 fig, 1 tab, 12 ref, 3 append. FWPCA (EPA) Grant WP-00837.

Descriptors: *Seiches, *Hydraulic models, *Hydraulic similitude, *Waves (Water), Fluid friction, Froude number.
Identifiers: Proudman number.

For complete dynamic similarity between a hydraulic model of a lake or closed basin and its prototype, both the Froude number and the Proudman number must be equal in the model and the prototype. For turbulent flow the Proudman number cannot be explicitly determined and adjustment of model friction may be required. A method for adjustment of model friction is described which requires comparison of the damping of a standing long wave (or seiche) in the prototype and in the model basin. Assuming that the model frictional resistance could be decomposed into smooth boundary resistance and the resistance due to the addition of roughness elements, a mathematical formulation was developed for use in predicting the decay modulus for a roughened model basin. Good agreement was found between the analytical predictions and experimental results. (Knapp-USGS)

CONTRIBUTION TO THE STUDY OF ZOOPLANKTON AND ZOOBENTHOS IN THE MINGECHAUR RESERVOIR, (IN RUSSIAN),
A. R. Khalilov, and I. A. Akhmedov.
Izv Akad Nauk Az SSR Ser Biol Nauk. 2. p 91-96. 1972.
Identifiers: Arctodiaptomus-Acutilobatus, *Cryptochironomus, Daphnia-Longispina, Diaphanosoma-Brachyurum, Mesocyclops-Dybowskii, Plankton, Polyarthra-Trigla, *Procladius, Reservoirs, Synchaeta-Pectinata, *USSR (Azerbaydzhan), *Zooplankton, Zoobenthos.

The zooplankton and zoobenthos fauna of the Mingechaur (Azerbaydzhan, USSR) storage-lake was studied. The zooplankton fauna contained 25 species of which Polyarthra trigla, Synchaeta pectinata, Diaphanosoma brachyurum, Daphnia longispina, Arctodiaptomus acutilobatus and Mesocyclops dybowskii were prevalent. The zoobenthos fauna contained 77 species and forms with Procladius and Cryptochironomus ex. gr. defectus being most frequent.--Copyright 1973, Biological Abstracts, Inc.

COMPARATIVE BIOLOGY OF TILAPIA RENDALLI (BOULENGER) (PISCES CICHLIDAE) IN LAKE ITASY AND LAKE MANTASOA, (IN FRENCH),
J. Moreau.
Cah O R S T O M (Off Rech Sci Tech Outre-Mer) Ser Hydrobiol. Vol 5, No 1, p 3-52. Illus. 1971. (English summary).
Identifiers: Breeding, *Cichlidae, Comparative biology, Fecundity, Feeding, Growth, Lakes, *Madagascar (Lake Itasy-Lake Mantosa), Malagasy, Pisces, Population, Tilapia-Nilotica, *Tilapia-Rendalli.

A comparative study was made of the biology of T. rendalli in 2 lakes of the Malagasy Highlands (Madagascar): Itasy and Mantasoa lakes. These lakes were compared with respect to the geography, climate, aquatic conditions and T. rendalli populations. T. rendalli has a larger breeding season and better fecundity in Itasy lake. In Mantasoa lake the fecundity depends on the breeding season, Egg laying occurs more often in the former than in the latter lake. This fish is herbivorous and phytoplanktophagous in Itasy lake and only planktophagous in Mantasoa lake. Statistical tests on its condition-coefficient are included. The growth of T. rendalli was analyzed by reading and interpreting ring formation on the scales. Growth curves are drawn according to the equation of Von Bertalanffy by Abramson and Tomlinson method. T. renalli population dynamics and the suitability of introduction of a new species of Tilapia (T. nilotica) is discussed.--Copyright 1973, Biological Abstracts, Inc.

LIMNOLOGICAL CHARACTERISTICS OF JEZERO ON THE ISLAND OF KRK, (IN SERBO-CROATIAN),
M. Petrik, M. Zebec, and M. Mestrov.
Krs Jugosl Carsus Iugosl. Vol 7, No 6, p 189-206. 1971. Illus. (English summary).
Identifiers: Islands, Krk Island, Limnological studies, *Yugoslavia (Jezero Lake).

Physico-chemical and biological analyses of the water of Jezero, a lake on the island of Krk, Yugoslavia carried out in June and July 1968, have shown that horizontally the water is thermally and chemically homogeneous and that thermal and chemical stratification takes place in the first half of summer. According to biological evaluation and vertical distribution of O2, showing a considerable domination of the deficient over the sufficient layer, Jezero is a typical eutrophic lake; it is in an advanced stage of its development as is shown by the distribution of macrovegetation in the lake. Low concentrations of BOD5, nitrogen compounds, and phosphates indicate that there is no pollution of water. Saprobiologically, the water has proved to be in a beta-mesosaprobic condition. The hardness of the water, 230-279 mg CaCO3/l, is for the most part carbonate hardness, largely consisting of Ca hardness, which is characteristic of water from calcareous soil. Chlorides were not high, about 90 mg/l; this concentration is far below the concentration found in the well water Vrutak which provides water for the water-supply system of the near-by village of Njivice. Measures are proposed to stop the process of eutrophication and pollution from the surrounding parts of the lake and from the Veli Lug area.--Copyright 1973, Biological Abstracts, Inc.

GROWTH RATES OF LEPOMIS MACROCHIRUS (CENTRARCHIDAE) IN THREE AREAS OF LAKE TEXOMA,
Ouachita Baptist Univ., Arkadelphia, Ark.
H. Brown, and H. McCarley.
Southwest Nat. Vol 17, No 4, P 371-374. 1973. Illus.
Identifiers: Centrarchidae, *Growth rates, Lakes, Lepomis-Macrochirus, *Lake Texoma (Tex-Okla), *Bluegulls.

Growth rates of bluegills (L. macrochirus) were determined for 3 areas of Lake Texoma Oklahoma: the Buncombe Creek area, the Island area, and the Denison Dam area. The total length of the Island bluegills for all age classes exceeded bluegills from both the Buncombe Creek and Denison Dam areas. The difference in total length of bluegills of the IV and V age classes from the Islands was significantly greater than the bluegills from the other 2 areas. Calculated growth rates of age groups IV and V also confirmed that bluegills in the Island area grew more during each year of life than bluegills in the other 2 areas.--Copyright 1973, Biological Abstracts, Inc.

DESCRIPTION, DISTRIBUTION, AND ECOLOGY OF THE ROTIFER AND CRUSTACEAN PLANKTON COMMUNITIES, FLATHEAD LAKE, MONTANA,
Montana Univ., Missoula. Dept. of Zoology.
J. F. Tibbs.
Available from the National Technical Information Service as PB-226 242 $2.75 in paper copy, $1.45 in microfiche. Montana University Joint Water Resources Research Center, Report No. 39 Bozeman, (1973) 9p, 1fig, 1tab, 13 ref. OWRR A-052-MONT (1).

Descriptors: Ecology, Zoology, *Crustaceans, *Rotifers, *Plankton, Montana, Distribution.
Identifiers: *Flathead Lake (Mont).

Objectives were to determine the rotifer, copepod, and cladoceran fauna of Flathead Lake and to describe the Diel and temporal variations of density and spatial distribution as influenced by physical and chemical features of the lake. Another objective was the recovery of records, notes, and collections of previous investigators, such that irregularities in the published literature might be corrected or confirmed. Because few collections of any sort remain in Biological Station or University of Montana Museums, to locate museums, universities, and individuals who may have or may know the location of Flathead Lake zooplankton collections. QUANTITATIVE ESTIMATION OF BOTTOM FAUNA IN LAKE MARIUT,
Alexandria Inst. of Oceanography and Fisheries (Egypt).
A. A. Samaan, and A. A. Aleem.
Bull Inst Oceanogr Fish. 2. p 375-397, 1972, Illus.
Identifiers: Balanus-improvisus, *Bottom fauna, Chironomid, Corophium, Cyprideis-litoralis, Foraminifera, Gammarus, Lakes, Larvae, Melania-tuberculata, Mercierella-enigmatica, Nematode, Nereis-diversicolor, Oligochaete, *United Arab Republic (Lake Mariut), *Distribution patterns.

The distribution of bottom animals in Lake Mariut, United Arab Republic varies greatly according to the different habitats. The highly polluted area is extremely poor in bottom animals, while the less polluted area harbors a fauna similar to that present in the bare area but in smaller numbers. The bare area is the most suitable habitat for the survival of benthos. The Potamogeton belt was unfavorable for the growth of bottom animals. The polychaete Nereis diversicolor is the most important bottom animal inhabiting the lake and it constitutes about 49.9% of the biomass of bottom animals. It shows a peak in Jan. and in April. The gastropod Melania tuberculata constitutes about 34.3% of the biomass of the bottom fauna. It is widely distributed in the bare area. Melania is recorded all year with maximum distribution in Aug. and Sept. The amphipod Corophium constitutes about 11.2% of the biomass of bottom animals. It is recorded only in the bare area. Gammarus comprises about 3.4% of the biomass of the bottom animals in the lake. Chironomid larvae constitute about 1.2% of the biomass of bottom animals in the lake. They form the mean benthos at the Potamogeton plant belt. Two other forms of bottom animals of rare occurrence comprise the barnacle Balanus improvisus and the tube worm Mercierella enigmatica. These animals show uneven distribution and they usually grow on hard bottoms and on stems of phragmites. Microscopic examination of the bottom muds indicates the presence of several microorganisms in the lake bottom. These include: the ostracod Cyprideis litoralis, free living nematodes, oligochaetes and foramini era.--Copyright 1973, Biological Abstracts, Inc.

ON MALLOMONAS LELYMEME HARRIS ET BRADLEY (CHRYSOPHYCEAE), (IN JAPANESE),
Kobe Univ. (Japan). Dept. of Biology.
E. Takahashi, and H. Hirose.
Bull Jap Soc Phycol. 20 (3): 90-93, 1972, Illus, English summary.
Identifiers: *Chrysophyceae, *Japan, Mallomonas-lelymeme, Morphology, Ponds, Temperature, Hydrogen ion concentration, Algae.

M. lelymeme was found from ponds in Japan. The characteristic structure revealed by electron microscopy closely agrees with that of the type species, but differs slightly from other foreign material hitherto reported, in that the lattice structure at the shield was smaller in number of the crossing ridges. In Japan and foreign countries, the species was found from lakes and ponds whose pH was in a range from 4.9-6.6 and the water temperature was in a wide range less than 29C. This proves that the species is acidophylic and eurythermal.--Copyright 1973, Biological Abstracts, Inc.

COMPARATIVE PRODUCTIVITY STUDIES OF THREE MECKLENBURG LAKES (LAKE KUMMEROW, LAKE TETEROW AND LAKE MALCHIN), (IN GERMAN),
Rostock Univ. (East Germany). Institut fuer Hygiene.
L. Kalbe, and H. A. Schulze.
Z Gesamte Hyg Grenzgeb. Vol 18, No 3, p 197-201. 1972. Illus.

Identifiers: *East Germany (Mecklenburg), Lakes, *Sampling, *Photosynthetic productivity, Plankton.

These 3 lakes, Kummerower (KS), Teterower (TS), and Malchiner (MS) See (East Germany) were studied by spot sampling and by the 14C-method in situ for photosynthetic productivity. Various characteristics of these lakes, such as geology, size, depth, etc. are pointed out. The tests were done by a crossover technique, involving exposure of sample bottles from one lake to one of the other lakes. Plankton containing MS and TS water are superior to KS water in regard to photosynthetic potency and nutrient reserves, but cannot fully utilize these potencies in the original waters for reasons of the optical energy climate.--Copyright 1973, Biological Abstracts, Inc.

THE AGE GROUP DISTRIBUTION OF PELOBATES FUSCUS (LAUR.) AT THE KUIBYSHEV RESERVOIR SHORES (IN RUSSIAN),
Kazan State Univ. (USSR).
V. A. Ushakov, and V. I. Garanin.
Ekologiya, Vol 3, No 4, p 89-90, 1972.
Identifiers: Age distribution, *Pelobates-fuscus, Reservoir shores, *USSR (Kuibyshev reservoir), *Animal populations.

The influence of huge water reserves (USSR) upon the structure of animal populations surrounding it was examined. A P. fuscus population was studied from 1964-1969. Different age groups settle at various sites. Adults and young disperse during the summer throughout forests along the accumulative beaches, while the forests lining abrasive beaches are almost exclusively occupied by young animals that do not participate in that seasons mating period. Through such emmigration of young, the area covered by P. fuscus increases while the competition in the optimal area diminishes.--Copyright 1973, Biological Abstracts, Inc.

2I. Water in Plants

STUDY OF THE INTRACELLULAR WATER STATE IN PLANTS UNDER THE EFFECT OF PHENOLS, (IN RUSSIAN),
Voronezhskii Lesotekhnicheskii Institut (USSR).
V. D. Roshchina.
S-KH Biol. Vol 7, No 4, p 554-558. 1972. Illus. (English summary).
Identifiers: *Beta-Vulgaris-F-Rubra, *Intracellular water, *Phenols, *Plant tissues, Water exchange (Plants).

The storing tissue of Beta vulgaris f. rubra was treated with solutions of phenol, resorcine, floroglucine, pyrogallol, salicylic and cinnamic acids at concentrations of 10-3 to 10-4 M. Changes of the water content were determined by the method of dynamic characteristics. Phenol compounds affect the water-exchange of plant tissues and the state of the intracellular water, probably due to the interaction of phenols with cytoplasmic proteins. The greatest transformations of the water composition are observed as an effect of aromatic oxyacids and polyphenols with the orthoplacement of hydroxylic groups.--Copyright 1973, Biological Abstracts, Inc.

THE PHENOLOGY OF DRAGONFLIES IN THE DEHRA DUN VALLEY, INDIA,
Forest Research Inst., Dehra Dun (India). Forest Entomology Branch.
A. Kumar.
Odonatologica (Utr). Vol 1, No 4, p 199-207. 1972. Illus.
Identifiers: *Dragonflies, *India (Dehra Dun Valley), Larval habitats, *Phenology, Monsoon ponds.

Seasonal distribution of some Indian species, which centers largely around different types of larval habitats, is discussed. In the valley, 2 main types of larval habitats are present, i.e., the perennial streams, and seasonal monsoon ponds. The observations seem to indicate that in the species developing in perennial streams, the larval period is prolonged for some 5-8 mo., while the adults are on wings for not less than 3-4 mo. On the other hand, the larval period of species breeding in seasonal monsoon ponds is shortened to about 2-4 mo., while their adult life span is prolonged to 8-9 mo.--Copyright 1973, Biological Abstracts, Inc.
W74-02237

ON THE ORIGIN OF THE WET-SEASON FORM OF ZONOCERUS VARIEGATUS (L.) (ORTH., ACRIDIDAE) IN SOUTHERN NIGERIA, WITH SOME BIOLOGICAL NOTES,
Iban Univ. (Nigeria). Dept. of Biology.
T. Taylor.
Bull Entomol Res. Vol 61, No 4, p 661-667. 1972. Illus.
Identifiers: Ctenophores, *Acrididae, Biological studies, Breeding, Forests, Habitats, Morphometrics, *Nigeria, Orthoptera, Rain, Savanna, Seasons, *Zonocerus-Variegatus.

Previous reports and field observations at Ibadan and in northern Nigeria established the occurrence of a dry-season form and wet-season form of Z. variegatus. The wet-season form in the savanna areas of northern Nigeria is virtually identical with

that from southern Nigeria on the basis of breeding seasons, habitat and morphometrics. Morphometrics show the wet- and dry-season forms to be distinct. The dry-season form in the wet rain forest zone may spread into the dry savanna areas giving rise to a wet-season form adapted to the different climatic conditions. The increasing occurrence of the wet-season form in the south probably represents a re-invasion by the northern wet-season form.--Copyright 1973, Biological Abstracts, Inc.

ECOLOGICAL AND PHYTOSOCIOLOGICAL STUDY OF A SECTOR IN THE LYBIAN DESERT,
Cairo Univ., Giza (Egypt). Faculty of Science.
K. H. Batanouny, and S. Abu El-Souod.
Vegetatio. Vol 25, No 5/6, p 335-356. 1972. Illus.
Identifiers: Anabasis-Articulata , Aristida-Plumosa, Artemisia-Monosperma, *Deserts, *Ecological studies, Helianthemum-Lippii, *Libian desert, *Phytosociological studies, Pituranthus-Tortousus, Soil moisture.

The area surveyed is located in the north-eastern corner of the Lybian desert and extending along Cairo-Alexandria desert road. The southern part of the area is extremely arid, while the northern part is semi-arid and with graduation in between. The annual rainfall ranges between 24 mm at Giza located in the extreme south and 184 mm at Alexandria located in the north. The vegetation is formed of plant communities with different floristic composition. The plant cover ranges from widely separated patches of vegetation in spots where the coverage is less than 5% to scrubland types where the coverage may reach up to 70%. This difference is comparable to the variation in the annual rainfall from south to north. Five communities were defined along the road, named after the dominant species: Aristida plumosa, Pituranthos tortuosus, Artemisia monosperma, Helianthemum lippii and Anabasis articulata. Each community has a group of perennial species showing abundance-dominance scales and presence values higher than in other communities. Perennials are better indicators for plant life in any area than ephemerals. Plant communities in the desert are better defined not only by the dominant, but also by the group of ecologically related species, termed 'important species' of the community. Water relations of soil and air are the major controlling factors. The growth of plants is a matter of tolerance and not of fulfillment of requirements. The various species show different ecological amplitudes, connected with the tolerance of the plant to the drastic conditions.--Copyright 1973, Biological Abstracts, Inc.

STUDY ON THE PLASMOLYSIS TIME IN EPIDERMAL CELLS FROM LEAVES OF SAXIFRAGA STOLONIFERA MEERB (IN JAPANESE),
Kumamoto Univ. (Japan). Faculty of Education.
Masa-O. Ya-E.
Mem Fac Educ Kumamoto Univ Sect 1 (Nat Sci). 20. p 33-42, 1972, Illus, English summary.
Identifiers: Diurnal, *Epidermal cells, Leaves, Permeability, *Plasmolysis time, *Saxifraga-stolonifera, Seasonal, Temperature, Time.

The plasmolysis time in epidermal cells from the underside of S. stolonifera was studied especially in relation to temperature. The plasmolyticum was employed 1.5 isotonic and 0.73 M sucrose solution. Plasmolysis time is longest in Jan. and Feb., the coldest season, and is shortest in July and Aug., the hottest season. In spring and autumn, plasmolysis time is intermediate between those in winter and in summer, yet that in spring is longer than that in autumn even at the same temperature. Plasmolysis time in the early morning is longer than that in the daytime, and the more temperature changes in a day, the more plasmolysis time changes. Temperature coefficient of plasmolysis time, speed of rounding up on plasmolysis, was about Q10 ± 4 at 10C-20C-30C, when the temperature during each experiment was changed artificially in Jan. and Feb. In a certain year, the Q10 at 10C-20C in hardened cells was larger than Q10 ± 4. The seasonal and diurnal variations of plasmolysis time are affected passively by temperature.--Copyright 1973, Biological Abstracts, Inc.
W74-02542

SOME FURTHER RESULTS OF THE ZOOPLANKTON STUDIES IN THE CZECHSLOVAK-HUNGARIAN STRETCH OF THE DANUBE,
Slovenske Polnohospodarske Akademie, Bratislava (Czechoslovakia). Laboratorium Rybarstva.
M. Vranovsky.
Biologia (Bratisl), Vol 27, No 11, p 821-827, 1972, Illus, English summary.
Identifiers: *Cladocera, *Copepoda, Czechoslovakia, *Danube River, Hungary, Plankton, *Rotifera, *Zooplankton.

The average abundance of Rotatoria prevailed over that of Copepoda 25 times and over that of Cladocera 170 times in the Danube zooplankton in 1967. The decrease of the current velocity or short-term interruptions of the flow in the backwaters studied showed either none at all or only a small influence on the zooplankton. However, during the autumn interruption of the flow lasting 3 mo. in the backwaters, average abundance of zooplankton increased conspicuously in comparison with that in the main stream.--Copyright 1973, Biological Abstracts, Inc.

CONSIDERATIONS CONCERNING THE BIOLOGY AND DISTRIBUTION AREA OF THE CYPRINID FISH PSEUDORASBORA PARVA (SCHLEGEL) IN THE ROMANIAN WATERS,
R. Giurca, and N. Angelescu.
Bul Cercet Piscic. Vol 30, No 3/4, p 99-109. 1971. Illus. (English summary).
Identifiers: Biology, *Cyprinid fish, Distribution, Pseudorasbora-Parva, *Romania.

The presence of the genus Pseudorasbora (introduced accidentally from China, with the fry of some game fish species) in natural water bodies (Ilfov, Crisul Repede, Danube Delta, Urlui) and in fish culture stations (Nucet, Pirlita, I. C. Frimu, Cefa, Buftea, Frasinet, Vitanesti, Mostistea) is noted, P. parva (whose vernacular name 'briceag,' was proposed in 1970) is one of the freshwater fishes with a reduced body size (6.5-10.5 cm-without C) and low weight (5.0-19.2 g), sexual maturation taking place simultaneously in individuals of both sexes at the age of 1 yr. It has a high spawning potentiality, represented by a relative fecundity attaining 181%, and an absoulte one, attaining 234%. The gono-somatic ratio is high, reaching at 3 yr the maximum values of 27%. The growth rate is intense at 1 yr. The condition factor represents maximum values (Q ±1.11) at the 3 yr old fishes. Measures are proposed for the elimination of these fish species from the fish culture station, by: the total drainage of the basin, followed by an attentive chlorination and installing afterwards some fine gauzes at the supply channels; the introduction of some predatory fish species, as pike-perch (Stizostedion lucioperca), in the moment when there are no carp fry in the pond, using the same system of gauzes; stocking carp fry only after removing completely the predatory fishes.--Copyright 1973, Biological Abstracts, Inc.

2J. Erosion and Sedimentation

A NEW OSCILLATING WATER TUNNEL,
Queen's Univ., Kingston (Ontario). Coastal Engineering Research Lab.
A. Brebner, and P. H. Riedel.
Journal of Hydraulic Research, Vol 11, No 2, p 107-121, 1973. 4 fig, 2 photo, 11 ref.

Descriptors: *Hydraulic models, *Waves (Water), *Erosion, *Unsteady flow, *Sediment transport, Scour, Sedimentation, Sedimentary structures, Ripple marks, Boundary layers, Turbulent flow.
Identifiers: Oscillating water tunnel.

An oscillating water tunnel with a 12-meter long working section of cross-sectional dimensions 0.5 x 1 meter was designed, built, and tested to simulate wave boundary layers for practically the full range of waves that may be produced in the sea or in wave flumes. The range of orbital amplitudes is 0.1 to 4 meters. The system may be used to determine bed shear stress at fixed beds, to study ripple form on a number of sediments with different specific gravities, and for conducting research into the fundamental properties of oscillatory boundary layers. Another use may be for the study of oscillatory flow around submerged objects such as pipelines or piles. (Knapp-USGS)

SLOPE ASPECT AND TUNNEL EROSION IN THE LOESS OF BANKS PENINSULA, NEW ZEALAND,
New South Wales Univ., Kensington (Australia). School of Geography.
P. J. Hughes.
Journal of Hydrology (New Zealand), Vol 11, No 2, p 94-98, 1972. 2 fig, 5 ref.

Descriptors: *Erosion, *Loess, *Gully erosion, Gullies, *Slopes, Topography, Soil erosion.
Identifiers: Soil tunneling, *New Zealand (Banks Peninsula), *Tunnel erosion.

The relationship between slope aspect and tunnel erosion on Banks Peninsula, New Zealand, was measured. For a sample area of Banks Peninsula the ratio of the number of tunneled slopes to the total number of slopes potentially subject to tunneling was determined. This ratio represents the relative likelihood that a slope in a particular aspect class will be affected by tunneling. The results are presented in the form of a rose diagram. Slopes facing west to northwest are most likely, and slopes facing southeast to south-southwest least likely, to be affected by tunneling. (Knapp-USGS)

INVESTIGATION OF FALL VELOCITY OF SEDIMENTS IN MOUNTAIN STREAMS, (ISSLEDOVANIYE GIDRAVLICHESKOY KRUPNOSTI NANOSOV GORNYKH REK),
V. K. Debol'skiy, and L. D. Kogan.
Meteorologiya i Gidrologiya, No 4, p 59-63, April 1973. 3 fig, 1 tab, 6 ref.

Descriptors: *Sedimentology, *Settling velocity, Movement, *Particle shape, *Particle size, Coarse sediments, Sedimentation rates, Standing waters, Equations.

An equation of movement (fall) of a particle in standing water is considered. A general expression is presented for fall velocity of particles of irregular shape. The expression obtained is confirmed by experiments with coarse sediments up to 500 mm in size and by experiments carried out by other investigators. An expression is given for considering particle shape in determining fall velocity. (Josefson-USGS)

SEDIMENTATION AND SCOUR OFF NUCLEAR POWER PLANTS,
Wisconsin Univ., Madison. Marine Research Lab.
M. L. Kohler, and J. R. Moore.
Available from NTIS as COM-73-10562, $3.00 in paper copy; $1.45 in microfiche. Report No. WIS-SG-73-331, 1972. 21 p, 12 fig, 3 tab.

Descriptors: *Lake Michigan, Lakes, *Nuclear power plants, Sedimentation, Powerplants, *Scour, *Beach erosion, Discharge (Water), Environmental effects, *Wisconsin.
Identifiers: Nearshore processes.

The sedimentary regimes which are interacting in the nearshore zone of Lake Michigan are defined, to determine the short-term effects of the power plant upon the coastal sediments and to provide a base line study which can be used in future years to evaluate the possible long-term effects. Study of the sediments in the area of the Point Beach Nuclear Power Plant revealed the major transport and deposition trends in the region. A base line has been set for future examination of long term consequences of this use of the shore of Lake Michigan. Sand is transported through and past the northern half of the study area to be deposited in the southern half. The fact that the material in the south must move past the discharge plume to reach its site of deposition is of special importance. The heavy mineral data indicate lag deposits forming in the intermediate waters of the southern region rather than in the littoral zone. No disruption of this process by the discharge plume was found. The beach profile site sequences show that changes are occurring which cannot be explained by lake level changes. It is tentatively concluded that the beaches are eroding. Whether or not the water discharge is the direct cause of this phenomenon cannot be stated at this time. (Sinha-OEIS)

Descriptors: *Ultraviolet radiation, *Infrared radiation, *Water properties, *Optical properties, Reviews, *Refractivity.
Identifiers: Optical constraints.

Extinction coefficients k (lambda) for water at 25C were determined through a broad spectral region by manually smoothing a point by point graph of k (lambda) vs wavelength lambda that was plotted for data obtained from a review of the scientific literature on the optical constants of water. Absorption bands representing k (lambda), were postulated where data were not available in the vacuum uv and soft x-ray regions. A subtractive Kramers-Kronig analysis of the combined postulated and smoothed portions of the k (lambda) spectrum provided the index of refraction n (lambda) for the spectral region 200 nm less than or equal to (lambda) less than or equal to 200 micrometer.

Analytica Chimica Acta, Vol 66, No 1, p 5-11, August 1973. 3 fig, 3 tab, 6 ref.

Descriptors: *Chromium, *Aqueous solutions, *Pollutant identification, Heavy metals, Chemical analysis, Alkaline earth metals, Temperature, Methodology, Sodium, Magnesium, Calcium, Strontium, Aluminum, Vanadium, Molybdenum, Manganese, Iron, Cobalt, Nickel, Copper, Cations, Instrumentation.
Identifiers: *Atomic absorption spectrophotometry, *Ionic interference, *Tantalum filament atomizer, Precision, Dectection limits, Sensitivity, Trace levels.

The effect of various foreign ions on chromium absorption in atomic absorption spectrometry was examined with a modified tantalum filament atomizer. The sample solution containing Cr was vaporized and atomized from a tantalum filament by electrical heating into an argon stream within an absorption chamber. All atomic absorption signals were recorded with the height of the absorption signal being used to determine the concentration of Cr. The highest absorption signal was obtained when the filament temperature level (1650 degrees) was the lowest. The detection limit of this method was found to be 0.94 pg and the sensitivity was 0.52 pg. Ten determinations using 6 ppm Cr solution gave a coefficient of variation of 2.8 percent. The effects of 100-, 50- or 10-fold weights of 12 different metal ions on the absorption signal in a 6 ppm Cr solution were measured at various temperatures. No interferences of Fe, Cu, Mn, Al or Na were observed irrespective both of concentrations and filament temperature levels; Fe did not interfere even at a 300-fold amount. No interference was observed at the 10-fold level with the exception of alkaline earth elements and V. The proposed technique is very rapid as a complete single analysis of the aqueous sample requires only 2 min. There are no memory effects between determinations. The most prominent advantages of the proposed method of atomization are its high sensitivity, simplicity and rapidity. (Holoman-Battelle)

Pennsylvania State Univ., University Park. Dept. of Chemistry.
R. W. Liddell, III, and P. C. Jurs.
Applied Spectroscopy, Vol 27, No 5, p 371-376, September/October 1973. 2 fig, 3 tab, 9 ref.

Descriptors: *Computer programs, *Data processing, *Pollutant identification, *Organic compounds, Computer models, Alcohols.
Identifiers: *Infrared spectra, *Pattern recognition, Carbonyls, Cyclohexanes, Ketones, Esters, Benzene, Ethers, Infrared spectrophotometry.

The pattern recognition technique utilizing adaptive binary pattern classifiers has been applied to the interpretation of infrared spectra for carbonyls, cyclohexanes, alcohols, ketones, esters, benzene, and ethers. The binary pattern classifiers were trained to determine the chemical classes of x-y digitized infrared spectra. High predictive abilities were obtained in classifying unknown spectra. A new training procedure for binary pattern classifiers was developed and used to classify ir spectra into chemical classes. Pattern classifiers trained in the conventional way and by the new procedure were used in conjunction with feature selection, and it is shown that a small fraction of the data is necessary to classify these infrared spectra successfully into chemical classes. Quantitative determination of the concentration of paramagnetic ions in aqueous solutions is performed by NMR relaxation titration. By measurement of the nuclear spin-lattice relaxation time T sub 1 or the nuclear spin-spin relaxation time T sub 2 redox titrations and complexometric determinations of the concentration of paramagnetic ions are possible. Also the precipitation of ions from the solution can be followed by this method. The use of a magnetic indicator in this analytical method is shown. The sensitivity of the method goes down to concentrations as low as 0.001 M. The accuracy of NMR relaxation titration is better than 1 percent. A number of applications of the method are given. Identifiers: *Gas bubble electrification, Acid-base titration, Complexiметric titration, Acetic acid, Nickel chloride, Trisodium trimetaphosphate, Trisodium orthophosphate, Tetrasodium pyrophosphate, Pentasodium triphosphate, Titrimetry.

A simple theory is proposed to account for the reciprocal relationship between concentration of solute and the charge on a droplet ejected as a rising bubble bursts at a solution's surface. Reasonable agreement is found between theoretical predictions of charge in multivalent electrolytes and the experimental values. Application to continuous analysis of flowing systems and to end-point detection is demonstrated for acid-base and complexiметric titrations. (Holoman-Battelle)

HANGING MERCURY DROP ELECTRODEPOSITION TECHNIQUE FOR CARBON FILAMENT FLAMELESS ATOMIC ABSORPTION ANALYSIS. APPLICATION TO THE DETERMINATION OF COPPER IN SEA WATER,
Texas Univ., Austin. Dept. of Chemistry.
C. Fairless, and A. J. Bard.
Analytical Chemistry, Vol 45, No 13, p 2289-2291, November 1973. 2 fig, 1 tab, 25 ref.

Descriptors: *Copper, *Seawater, *Chemical analysis, Methodology, *Pollutant identification, Trace elements, *Electrochemistry, Heavy metals, Water analysis, Electrolysis, Laboratory equipment, Pollutants, Water pollution.
Identifiers: Hanging mercury drop electrode, Carbon filament, Flameless atomic absorption spectrophotometry, Controlled potential electrolysis, Detection limits, Accuracy, Electrodeposition, Volatilization, Precision.

Controlled potential electrolysis at a hanging mercury drop electrode (HMDE) has been coupled with carbon filament atomic absorption as an analytical technique and applied to the determination of Cu in seawater. Synthetic seawater and natural seawater samples were analyzed. Timed electrolyses at a controlled potential of -0.35 V vs. SCE were conducted with a simple three-electrode arrangement. Deaeration of analysis solutions was accomplished by bubbling N2 for 5 min prior to electrolysis and then by passing N2 over the solution during electrolysis. After electrolysis. After electrolysis relaxation losses were examined. Five microliters of p-xylene was used to pretreat the filament cavity. The mercury was volatilized completely by heating the filament at approximately 425 C, then the Cu was atomized. Accuracy was checked by the standard additions method. The natural seawater analysis gave 0.72 microgram Cu/l which is within the range for unpolluted seawater. The practical detection limit for this technique with this electrode configuration, solution volume, and electrolysis time is 0.2 microgram Cu/l. The absolute detection limit of the carbon filament atomizer is about 0.5 pg of Cu (essentially the same value as the sensitivity per 1 percent absorption). These results indicate that this is a suitable technique for the determination of Cu in unpolluted seawater with matrix interferences apparently eliminated and selective volatilization of Hg without covolatilization of Cu accomplished. In addition, in this technique, sample size is limited only by the electrolysis apparatus configuration, total amount of trace metal, and time, and is not restricted to the microliter capacity of the carbon filament. (Holoman-Battelle)

EXPERIMENTAL STUDY OF THE PHASE--SELECTIVE ANODIC STRIPPING ANALYSIS OF MICROMOLAR CADMIUM (II) AT THE MICROMETER HANGING MERCURY DROP ELECTRODE IN 0.1 M POTASSIUM CHLORIDE,
Kentucky Univ., Lexington. Dept. of Chemical Engineering.
E. D. Moorhead, and P. H. Davis.
Analytical Chemistry, Vol 45, No 13, p 2178-2184, November 1973. 5 fig, 3 tab, 28 ref.

Descriptors: *Cadmium, *Chemical analysis, *Electrochemistry, *Aqueous solutions, Electrolytes, Heavy metals, Methodology, Electrolysis, Trace elements.
Identifiers: Hanging mercury drop electrodes, Phase-selective anodic stripping, as Phase-selective voltammetry, Chemical concentration, Trace levels, Reproducibility, Sensitivity, Anodic stripping voltammetry, as Polarography, Potassium chloride.

Conflicting reports in the literature pertaining to the observed magnitude of the ac phase-selective current obtained in the anodic stripping of Cd from the HMDE prompted an experimental reassessment of the stripping behavior of this metal using a micrometer-type HMDE and 0.1 M KCl as base electrolyte. Reproducibility of the stripping analysis was indicated by a 1.20 percent average deviation in the measured peak height obtained for ten independent runs at the micromolar Cd (II) level. The functional dependence of peak height on signal frequency, applied ac voltage, and cadmium concentration conformed to theory developed previously for ac polarography. However, observed in-phase peak currents obtained during the stripping step were substantially smaller than those reported by previous authors for the same experiment. The influence of stripping scan rate on the Cd-Cd (Hg) system was examined, and peak heights were found to be strongly dependent on this parameter. The importance of maintaining well-controlled conditions during pre-electrolysis was indicated from brief studies of peak height dependence on solution volume and stirring rate. (Holoman-Battelle)

Bonn Univ. (West Germany). Institut fuer Physikalische Chemie.
H. D. Beckey.
Journal of Chromatography, Vol 83, p 315-320, August 29, 1973. 6 fig, 16 ref.

Descriptors: *Separation techniques, *Organic compounds, *Pollutant identification, *Mass spectrometry, Molecular structure, *Chromatography.
Identifiers: Column liquid chromatography, Field desorption mass spectrometry, Sample preparation, F mass spectra, Detection limits, Steroids, Molecular ions, Mass spectra, Spectrophotometric detector, Corticosterone, Progesterone, Prednisolone, Desorption, Ionization.

The first use of column liquid chromatography in combination with field desorption mass spectrometry is exemplified by the separation and identification of the components of a steroid mixture extracted from rat serum. There are two main reasons for the high-molecular-ion intensities obtained: (1) the smaller transferred energy in the field ionization process compared with other ionization modes increases the chance of detecting the intact molecular ions; and (2) the samples are not introduced via the commonly used direct introduction system for evaporation, but are applied to the field ion emitter from a solution using the emitter dipping technique. Hence ionization and desorption of the adsorbed molecules can be performed with minimum thermal stress. Potential applications for the coupling of liquid chromatography and field desorption mass spectrometry are discussed, especially in relation to the handling of the sample and the limits of detection. (Holoman-Battelle)

Descriptors: *Chemical analysis, *Separation techniques, *Spectrophotometry, Ion exchange, Aqueous solutions, Adsorption, *Anion exchange.
Identifiers: *Germanium, Chemical interference.

A very sensitive and selective method for the spectrophotometric determination of germanium has been described employing pyrocatechol violet. Prior to the determination, the germanium is first accumulated by extraction with tributyl phosphate (TBP) and kerosene and then separated from the co-extracted elements that interfere with the determination, by means of the strongly basic anion-exchanger Dowex 1,X8 in a mixture consisting of 30 vol. percent TBP, 60 vol. percent methlglycol and 10 vol. percent 12 N hydrochloric acid. In addition it was shown that this mixture is well suited to separate uranium quantitatively from germanium. The spectrophotometric determination of germanium is interfered with by V (V), Mo (VI), Ga (III), Tl (III), Sb (III), Sn (II) and Fe (III). The interference by iron can be averted by adding sodium-potassium tartrate. (Little-Battelle)

OCCURRENCE OF SILICA IN THE NATURAL WATERS OF THE HUNTLEY-ROBERTSON DISTRICT, SOUTHERN NEW SOUTH WALES,
New South Wales Dept. of Mines, Sydney (Australia). Chemical Lab.
M. Johnson, and W. D. Johnson.
Aust J Mar Freshwater Res. Vol 23, No 2, p 105-119. 1972. Illus.
Identifiers: *Australia (N.S.W.), Natural waters, *Silica.

The silica concentrations of both ground and surface waters from the Triassic Hawkesbury Sandstone (New South Wales, Australia) were found to range from 3.0-12.0 ppm. Samples of soil, surface bedrock, and fresh core material were leached with water, and the results of chemical analyses carried out on the subsequent solutions are discussed with reference to the source of the silica is solution. A time study of the release of soluble silica from sandstone indicated rapid dissolution within the first few days, with equilibrium concentration being reached after a period of several weeks due to inhibiting surface reaction on the mineral grains. A possible explanation, based on the effects of weathering and the impervious nature of the sandstone, is suggested to account for the similarity between the silica concentrations of surface water and groundwater.--Copyright 1973, Biological Abstracts, Inc.

Descriptors: *Water chemistry, *Water quality, *Isotope studies, *Structural geology, Folds (Geologic), Geologic time, Metals, Oxygen, Mixing, Oily water, Meteoric water, Water analysis, Water sampling.
Identifiers: *USSR, *Fergana.

The presence of a relation between isotopic and chemical composition of waters makes it possible to (1) determine boundaries of modern transgressions and regressions of oily water, (2) locate discharge areas of groundwater of varied origin, and (3) identify mixing zones of descending oxygen and ascending oxygen-free waters. Favorable geochemical barriers for precipitation of ores of many elements can be constructed in mixing zones of descending oxygen and ascending oxygen-free waters. On the basis of isotopic and chemical composition of waters, four regions favorable to formation of deep mixing zones are identified: the Varzyk ore region of copper-bearing sandstone; the southeastern limb of the Chustpapskaya anticline (from Kattasay to Almassay); the pericline and periclinal strata of the northwestern limb of Supetau; and the pericline and southeastern limb of the Karagundayskiy structural nose. CHEMICAL CHARACTERISTICS OF SURFACE WATERS IN THE UPPER CHIRCHIK RIVER BASIN (KHIMICHESKAYA KHARAKTERISTIKA POVERKHNOSTNYKH VOD VERKHNEY CHASTI BASSEYNA R. CHIRCHIK),
Akademiya Nauk Ubzekskoi SSR, Tashkent. Institut Seismologii.
G. Kh. Umarova.
Uzbekskiy Geologicheskiy Zhurnal, No 3, p 34-37, 1973. 2 tab, 3 ref.

Descriptors: *Surface waters, *Water chemistry, *Water quality, *Water properties, Water types, Water analysis, Chemical analysis, Inorganic compounds, Ions, Water sampling.
Identifiers: *USSR, *Chirchik River.

Water samples were collected and analyzed to determine the chemical composition of surface waters of the Ugam, Bel'dershay, Chimgansay, Avgansay, and other rivers in the Chirchik River basin in Uzbekistan. The salinity of the waters is weak (0.220-0.285 g/liter). The maximum amount of dissolved solids is 0.575 g/liter (lower reaches of the Azadbashsay River). The chemical composition of the waters is of the bicarbonate-sulfate-calcium-magnesium (predominant) and bicarbonate-sulfate-sodium-magnesium types. Hydrogen ion concenttation is 7.8-8.2. Hardness characteristics range from soft to moderately hard. The chemical composition of the waters is directly correlated with the lithological composition of the rocks comprising the region. Results of chemical analyses of water samples collected from upper reaches of the Chirchik River are tabulated. (Josefson-USGS)

BOLINAS LAGOON, MARIN COUNTY, CALIFORNIA, SUMMARY OF SEDIMENTATION AND HYDROLOGY, 1967-69,
Geological Survey, Menlo Park, Calif.
J. R. Ritter, and W. M. Brown, III.
Available from NTIS, Springfield, Va. 22151, PB-224 080/AS; Price $3.00 printed copy; $1.45 microfiche. Water-Resources Investigations 19-73, August 1973. 74 p, 32 fig, 7 tab, 103 ref.

Descriptors: *Sedimentation rates, *Hydrology, *Lagoons, *California, Sediment transport, Tidal effects, Estuaries, Erosion, Littoral drift, Winds, Sands, Topography, Vegetation, Streamflow, Hydrologic data, Sediment load.
Identifiers: *Bolinas Lagoon (Calif.).

Sedimentation in Bolinas Lagoon, a 1,100-acre lagoon 15 miles northwest of San Francisco, presently averages about 16 acre-feet per year. This value has been determined from rates of 21 acre-feet per year from net sediment budget studies, 16 acre-feet per year from topographic surveys of the lagoon bottom in 1939 and 1968, and 11 acre-feet per year computed from geological evidence. At the indicated rates the deposition in the lagoon would average 0.5 to 1.0 foot in the next 50 years, and the lagoon would fill to the highest high water level in 340 to 650 years. Studies from 1967 to 1969 indicated that approximately 80 acre-feet of sediment was transported into and 86 acre-feet was transported out of Bolinas Lagoon annually by tidal flows. Cliff erosion west of the inlet and littoral drift provided the principal sources of the sediment transported into the lagoon flood-tides. Winds and streamflow brought additional sediment into the lagoon, and shore erosion contributed a minor part. Measurements of tidal flows and suspended-sediment discharge in the lagoon inlet showed that: (1) most of the suspended sediment is sand, (2) the average velocity was as much as 4.9 feet per second, (3) instantaneous suspended-sediment discharge reached rates as large as 11,600 tons per day on an ebbtide, (4) tidal flows ranged from 180 to 2,800 acre-feet, and (5) corresponding suspended-sediment discharge ranged from 3 to 1,200 tons. RESEARCH IN THE COASTAL AND OCEANIC ENVIRONMENT,
Delaware Univ., Newark.
W. S. Gaither.
Available from NTIS, Springfield, Va. 22151 as AD-759 878 Price $3.00 printed copy; $1.45 microfiche. Annual Status Report, September 1971. 28 p, 12 fig, 8 ref. ONR N00014-69-10040Z.

Descriptors: *Littoral drift, *Sediment transport, *Coasts, *Delaware, Environmental effects, Vegetation effects, Ocean currents, Tidal effects, Estuaries, Geomorphology, Data collections, Sedimentation, Soil types, Waves (Water), Coastal marshes, Phosphates, Biochemistry, Shores, New Jersey, Maryland, Correlation analysis, Evaluation, Environmental control.

Progress during the second year of a multidisciplinary study of a section of the Atlantic seacoast (Delaware and adjacent areas of New Jersey and Maryland) is summarized. New knowledge of coastal geology and geologic history has been developed, and the properties of soils sediments in nearshore, beach, and backshore locations have been more fully determined. Continued theoretical investigations of wave action, model studies of sedimentary processes and underground water behavior, and the results of additional observations of vegetative growth and of surface energy exchanges are reported. Future objectives, particularly in the area of coastal zone remote sensing, are outlined. This study, sponsored by the Geography Branch of the Office of Naval Research, is intended to provide thorough basic knowledge of this representative coastal zone that can be applied to similar littoral areas throughout the world to identify offshore, tidal zone, beach, and backshore surface and subsurface features from limited and preferably remote observations. (Woodard-USGS)
W74-02481

GUIDELINES FOR THE COASTAL ZONE.
Coastal Plains Center for Marine Development Services, Wilmington, N.C.

Publication 73-5 July 1973. 14 p.

Descriptors: *Coastal plains, *Land use, *Land classification, *Water use, Land resources, Land development, Water resources development, Zoning, Land management, Water management, Comprehensive planning, Social aspects, Political aspects, Multiple-purpose projects.
Identifiers: Coastal zone management.

The Coastal Zone Management Act, which became law in October of 1972, encourages states to develop tools for the long-term planning and management of invaluable and irreplaceable coastal resources. To assist the coastal states, grants were authorized for the development of a coastal zone management program including a comprehensive statement in words, maps, illustrations, and other media of communication setting forth objectives, policies, and standards to guide public and private uses of lands and waters in the coastal zone. The primary purposes of the publication are to assist in the development of such plans, and to provide guidelines for coastal zone use and development. The guidelines comprised two major parts. First, the section on classifications of land and water addresses the questions of whether development is suitable at all and if so, what types and in what areas; and if not, what other uses are suitable. Secondly, the section on usage considerations deals primarily with how development should take place, precautions needed to be taken, and the rationale which supports this criterion. (Daniels-Florida)

SEASONAL AND AREAL DISTRIBUTION AND ABUNDANCE OF THE COPEPODA IN A MISSISSIPPI ESTUARINE SYSTEM,
Mississippi Marine Conservation Commission, Biloxi.
H. M. Perry.
Available from NTIS as COM-72-11175, $3.00 in paper copy; $1.45 in microfiche. MS thesis, University of Southern Mississippi, June 1970. 80 p, 12 fig, 13 tab, 59 ref, append. NOAA, NMFS 2-25-R.

Descriptors: *Bioindicators, Mississippi, Coasts, *Ecological distribution, *Copepods, Seasonal Spatial distribution, Hydrography, *Estuaries, *Sounds, *Crustaceans, Inland waterways, Pollutant identification, Water pollution.
Identifiers: *Mississippi Sound.

Copepoda are crustaceans of special interest because of their possible use as biological indicators of specific water masses. A knowledge of the seasonal and areal distribution and abundance of these organisms in the Mississippi Sound would serve a useful purpose not only from the standpoint of commercial fisheries, but also from the standpoint that they may be useful tools for making inferences concerning the hydrography of this area in future studies. The purposes of this investigation were to determine: (1) the various species of free-living copepods present in the area of Mississippi Sound under study; (2) the numerical abundance of each species determined monthly for a period of one year; (3) the seasonal and areal distribution and abundance of these organisms; and (4) the physical conditions under which each species occurs. (Sinha-OEIS)
W74-02637

WAVE BREAKING IN SHALLOW WATER,
Army Coastal Engineering Research Center, Washington, D.C.
C. J. Galvin, Jr.
In: Waves on Beaches and Resulting Sediment Transport, Academic Press, Inc., 1972. p 413-456. 12 fig, 5 tab, 50 ref.

Descriptors: *Waves (Water), *Shallow water, *Beaches, *Coasts.

Identifiers: Wave speed, *Breakers, Solitary waves, Beach slope, Oscillatory waves, Wave shape.

Deep water steepness and beach slope determine breaker type and breaker depth-to-height ratio. High initial deep water steepness induces breaking in deeper water since steepness grows faster than height. Slope determines the extent of nonlinear changes in wave shape, which occur at a slow rate relative to wave speed. Slow shape changes accompanying soliton development significantly affect the breaking of oscillatory waves and provide plausible explanations for data on the breaking of solitary waves. Empirical knowledge of the breaking process is summarized for reference by those preparing theoretical studies of the breaking process. (Sinha-OEIS)
W74-02638

PUGET SOUND RESIDENT COHO SALMON STUDY,
Washington State Dept. of Fisheries, Olympia.
F. Haw.
Available from NTIS as COM-72-11060, $3.00 in paper copy; $1.45 in microfiche. Completion Report, August 1970. 12 p, 4 fig, 6 tab. NOAA, NMFS AFC-35.

Descriptors: *Washington, Salmon, Fish populations, *Sounds, Recreation, Sport fish, *Migration, Estuarine fisheries, Coasts, *Fish management, Fisheries, Resources development.
Identifiers: *Coho salmon, *Puget Sound (Wash).

Fin-marking studies have indicated that the coho salmon artificially produced in Puget Sound hatcheries tend to move out to forage along the outer coast of British Columbia and Washington, while the in-Sound resident population results primarily from certain natural spawning races. When the hatchery-produced fish return to Puget Sound on their spawning migration, they are no longer feeding and are thus difficult to catch on sport gear. (Sinha-OEIS)
W74-02639

DEVELOPMENT OF A MATHEMATICAL MODEL TO PREDICT THE OCCURRENCE OF CYNOSCION ARENARIUS IN MISSISSIPPI ESTUARIES,
Mississippi Marine Conservation Commission, Biloxi.
C. K. Eleuterius.
Available from NTIS as COM-72-11197, $3.00 in paper copy; $1.45 in microfiche. MS thesis, University of Southern Mississippi, August 1970. 38 p, 11 fig, 2 tab, 40 ref. NOAA, NMFS 2-25-R.

Descriptors: *Estuaries, *Fisheries, *Sounds, *Mathematical models, Environmental effects, Salinity, Temperature, Fish management, Mississippi, *Fish migration, Trout, Oxygen, Phosphates, Estuarine fisheries, Coasts.
Identifiers: *Mississippi Sound, *Cynoscion arenarius, Trash fish, White trout.

The non-random distribution of C. arenarius in Mississippi Sound confounds attempts at prediction using data collected from randomly assigned fixed stations. The occurrence of white trout is highly correlated with the density of the surrounding water as well as the rate of change in density. This is probably because of the osmotic mechanism that controls the concentration of the blood as well as the maintenance of internal water. Salinities in Mississippi Sound are within the tolerable range of the species throughout the year. Temperature as stated by Gunter (1945) is evidently the triggering factor to the migratory behavior of C. arenarius from the shallow Gulf into Mississippi Sound. The preference of white trout for certain bottom types probably because of the availability of food, is not unknown to local sport and commercial fishermen. Availability of food, current speeds, wind direction and force, pH and tide are additional factors that should be considered in reducing the amount of unexplained variation in improving the model to predict the occurrence of C. arenarius. (Sinha-OEIS)
W74-02640

DESIGN CONSIDERATIONS FOR A 3-D LASER DOPPLER VELOCIMETER FOR STUDYING GRAVITY WAVES IN SHALLOW WATER,
Army Coastal Engineering Research Center, Washington, D.C.
R. J. Hallermeier.
Applied Optics, Vol 12, No 2, p 294-300, February 1973. 5 fig, 27 ref.

Descriptors: *Gravity waves, *Waves (Water), *Shallow water, *Instrumentation.
Identifiers: *Laser Doppler velocimeter, Optics, Light scattering, Velocimeters, Fluid velocity.

A laser velocimeter system using three frequency-modulated light beams and one detector for measurement of the instantaneous velocity vector in reversing flow is considered. An analysis of the scattering and detection processes by means of the Mie and optical mixing theories is outlined. A system proposed for gravity wave studies uses an argon-ion laser and three Bragg cells as a source and a photomultiplier detector of the light backscattered from 0.2-micrometer-diameter spheres, introduced into the flow in a low concentration, and can measure local velocity vectors of magnitude between 0.1 m/sec and 3.0 m/sec, with turbulent fluctuations of 1% or greater intensity. AN ANNOTATED BIBLIOGRAPHY OF AERIAL REMOTE SENSING IN COASTAL ENGINEERING,
Clemson Univ., S.C. Dept. of Civil Engineering.
D. B. Stafford, R. O. Bruno, and H. M. Goldstein.
Army Coastal Engineering Research Center, Miscellaneous Paper No. 2-73, May 1973. 122 p, 1 tab, 200 ref.

Descriptors: *Coastal engineering, *Remote sensing, Bibliographies, Abstracts, *Aerial photography, Satellites (Artificial), *Coasts, *Beaches, Ecology, *Estuaries.
Identifiers: *Remote sensors, *Nearshore processes.

This bibliography covers representative literature on the applications of aerial remote sensing techniques to coastal engineering. About 200 references published since 1934 are presented. Annotations accompany each bibliographic entry and are a concise and informative summary of the references describing the characteristics of each remote sensor in coastal engineering investigations. Computer indexes of authors, titles, and keywords are included. (Sinha-OEIS)
W74-02646

BULLETIN AND SUMMARY OF RESEARCH PROGRESS FISCAL YEARS 1970-71.
Army Coastal Engineering Research Center, Washington, D.C.

Bulletin IV, March 1973. 48 p.

Descriptors: *Coasts, Shores, *Waves (Water), Surges, *Estuaries, Ecology, *Shore protection, *Coastal engineering, *Sediment transport.
Identifiers: Wind waves.

A summary is presented of progress in coastal engineering research at Coastal Engineering Research Center (CERC) for FY's 1970-71. Included are summaries of research and development programs on wind-wave action in coastal waters, shore processes, long-period waves and surges, inlet and estuary dynamics, coastal ecology studies, shore protection, offshore structures, and environmental data collection. Reports are presented on CERC support activities including automatic data processing, and technical and administrative services. CERC publications for FY's 70-71 are listed. (Sinha-OEIS)

THE USE OF DESALTED SEAWATER FOR INTENSIVE AGRICULTURAL APPLICATIONS, (EL USO DE AGUA DE MAR DESALADA PARA INTENSIVAS APLICACIONES AGRICOLAS),
Arizona Univ., Tucson. Environmental Research Lab.
C. N. Hodges, and C. Pena.
In: Papers, International Symposium on Water Resources Planning, Mexico City, Mexico Volume III, December 1972, 39 p, 7 fig, 8 tab, 6 ref.

Descriptors: *Arid lands, Desalination, *Agriculture, Electric powerplants, *Desalination plants, *Saline water, Water supply, Water supply development, Electric power production, Multiple purpose, Regional development, Greenhouses, Growth chambers.
Identifiers: *Mexico (Sonora), Abu Dhabi.

The University of Arizona and the University of Sonora have conducted a cooperative project investigating the desalting of seawater in the arid northwest Mexico. The study began in 1963 in Puerto Penasco, Sonora, Mexico, where originally solar desalination experiments were conducted. Large plastic bubble greenhouses with controlled environments were constructed and cabbages, cucumbers, and other vegetables were cultivated. After completion of the solar energy experiments, the plant was converted to diesel power. In 1969 Abu Dhabi (United Arab Emirates) extended a grant to the University of Arizona to construct a larger power/water/food plant based on the Puerto Penasco plant studies. An Arid Lands Research Center has been established there, and a plant with 48 greenhouses similar to those in Mexico was constructed. Crops like those in Puerto Penasco planted directly into cleaned beach sand came under full production in early 1972,with large yields of fruit and vegetables. The experience with both the Mexican and Arabian installations has been positive, indicating that such multiple-purpose plants have great application in areas where power, water, and high nutrient vegetables are scarce. (Muller-Arizona)
W74-02359

ANOTHER RIO GRANDE FOR NEW MEXICO,
Los Alamos Scientific Lab., N. Mex.
L. P. Reinig, R. I. Brasier, B. J. Donham, and W. S. Gregory.
In: State Water Plan, Proceedings of 18th Annual New Mexico Water Conference, April 5-6, 1973, Las Cruces: New Mexico State University Water Resources Research Institute Report No 026, p 50-61, July 1973. 3 fig, 2 tab, 9 ref.

Descriptors: *Water resources development, *New Mexico, *Groundwater resources, *Desalination, *Nuclear energy, Geothermal studies, Methodology, Costs, Economics, Water supply, Water demand, Mineral industry, Recreation facilities, Water utilization, Saline water, Groundwater, Water quality, Chemical analysis.
Identifiers: Tularosa Valley (N Mex).

Like other southwestern states, New Mexico needs more water. The Upper Rio Grande and Pecos basins have smaller water supplies, in relation to projected demand, than any other basin in the United States. A possible water shortage solution based on desalting, ultimately by means of geothermal or nuclear energy, the several hundred million acre-feet of saline groundwater in the Tularosa Valley is described. The resulting recreational-industrial-agricultural complex would ultimately encompass on the order of one million acres. It would provide one million acre-feet of fresh water per year, 2000 megawatts of electric power, valuable magnesium and other minerals separated from the saline water at a rate of several million tons per year, and many associated recreational and social benefits. The name referred to this enterprise during preliminary conceptual studies is the Tularosa-Rio (TRG) Project. (See also W74-02456) (Woodard-USGS)
W74-02461

MULTI-STAGE FLASH EVAPORATOR,
Societa Italiana Resine S.p.A., Milan (Italy). (Assignee).
D. Barba, G. Liuzzo, and G. Tagliaferri.
U. S. Patent No. 3,763,014, 4 p, 4 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 915, No 1, p 267, October 2, 1973.

Descriptors: *Patents, *Water treatment, *Desalination, Sea water, *Flash distillation, Condensers, Evporators, *Water quality.

The evaporator comprises an outer, continuous generally horizontally disposed, longitudinally extending casing and an inverted U-shaped shell which is positioned within and extends along the length of the casing. A plurality of vertical, spaced-apart, transverse partition walls having passages therethrough adjacent the bottom of the shell, subdivide the shell into a plurality of serially connected chambers. Inlets and outlets are provided for the continuous flow through the evaporation chambers of the pre-heated liquid (sea-water) to be evporated. Successively lower internal pressure exist in adjacent chambers. The outer walls of the shell and the inner walls of the casing define a number of separate condensation chambers positioned laterally on each side of the central evaporation zone, the condensation chambers extending along the length of the casing. Two heat exchangers, extending along the length of the casing, are positioned within the condensation chambers to cause condensation of the vapor while partially pre-heating the raw sea water. The flow of the raw sea water through the heat exchangers is in a direction opposite that of the flow of the sea water being evaporated in the evaporation chambers. (Sinha-OEIS)
W74-02490

INTERNALLY INTERCONNECTED MULTI--STAGE DISTILLATION SYSTEM,
Hydro Chemical and Mineral Corp., New York. (assignee).
A. Osdor.
U. S. Patent No. 3,755,088, 10 p, 31 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 913, No 4, p 1237, August 1973.

Descriptors: *Patents, *Distillation, *Condensers, *Desalination, Sea water, Multi-stage, *Flash distillation, Water treatment.

Evaporator and condenser arrangements for multistage systems are formed from continuous tabular columns and transverse plates. In the condensers, elongated partition plates cooperate with segments of the column wall todefine internal liquid passageways between spaced condensers. In the evaporators, the transverse plates are shaped to define wells and trap forming partitions. Arrangements are described for achieving imterspersal of condenser groups with minimum pumping and minimum use of column height. (Sinha-OEIS)

POWER, FRESH WATER, AND FOOD FROM COLD, DEEP SEA WATER,
Polytechnic Inst. of Brooklyn, N.Y.
D. F. Othmer, and O. A. Roels.
Science, Vol 182, No 4108, p 121-125, October 12, 1973. 7 ref.

Descriptors: *Aquifculture, Resources development, *Power marketing, Water resources, *Sea water, Freshwater, Steam, *Solar radiation, Deep water, Economic feasibility, Steam turbines, Solar stills, Marine algae, Marine animals, Lobster, Shrimp, Shellfish, Profit, *Water yield improvement.
Identifiers: *Mariculture, Deep sea farming.

The solar heat energy accumulating in the vast volumes of warm tropical seas is many times that produced by all existing power plants and could yield huge amounts of fresh water and electric power, as the evaporating warm surface water could generate steam to power a turbine and then freshwater upon condensation of steam by the cold water. A 'mariculture' pilot plant built by Alemco Inc. (Division of Viatech Inc., Syosset, N.Y) in the Caribbean indicates a great potential increase in revenues over that from power and freshwater generation. Deep sea water contains large quantities of nutrients to feed algae and, in turn, shellfish, shrimp, and lobster in shallow ponds. Valuable seaweed can be grown on wastes, and substantial profits can be derived by combined revenues from desalination, power generation, and mariculture. (Brown-IPC)
W74-02254

WEATHER MODIFICATION OPERATIONS IN CALIFORNIA, OCTOBER 1, 1970-SEPTEMBER 30, 1971,
California State Dept. of Water Resources, Sacramento. Div. of Resources Development.
T. A. Johnson, and J. B. Powers.
Available from State of Calif., Documents Section, P.O. Box 20191, Sacramento, Calif. 95820, Price $1.00. Bulletin No 16-71, June 1972. 18 p, 3 plate.

Descriptors: *Weather modification, *Artificial precipitation, *Cloud seeding, *California, Silver iodide, Polyelectrolytes, Surfactants, Fog, Projects, Data collections, Water yield.
Identifiers: Fog dispersion, Airport.

Weather modification operations were conducted in 10 areas of California during the 1970-71 water year by nine licensed operators. Two of these projects were operated to suppress fog: the active agents in one case were polyelectrolytes and surfactants and, in another, urea powder was dispersed. The remaining projects used silver iodide in various forms as the active agent to increase precipitation. Three projects reported in previous years were inoperative during the 1970-71 water year. The Santa Clara County Flood Control and Water District project was inactive for its second season. The Lake Almanor Project of the Pacific Gas and Electric Company, which functioned during the preceding season, was also inactive. Definite plans exist to reactivate both projects in the 1971-72 water year. The Upper Santa Ana River Project of the San Bernardino Valley Municipal Water District was active during the 1970-71 water year but no seeding occurred. Fog suppression experiments were performed at Arcata, California, by the U. S. Naval Weapons Center of China Lake, California, and the U. S. Air Force at McClellan Air Force Base, California. These two activities are described separtely from those performed by licensed operators. (Woodard-USGS)

A WAY TO MAKE THE DESERT GREEN,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
G. C. A. Morin, D. K. Parsons, W. G. Matlock, and D. D. Fangmeier.
Progressive Agriculture in Arizona, Vol 25, No 4, p 4-8. July-August 1973.

Descriptors: *Water harvesting, Rainfall-runoff relationships, Computer models, *Crop production, Runoff, *Arizona, Demonstration farms,

Arid lands, Soil moisture, Field crops, *Water yield improvement.
Identifiers: *Desert strip farming.

Collection of local rainfall as runoff for use on nearby cropped areas offers an alternative and little used means of meeting a crop's water requirements in arid and semiarid regions where water is the limiting factor. Desert strip farming, using water harvested from a collector area to help supply the moisture requirements of a cultivated crop on a smaller farmed area, is a technique used centuries ago not only in the Middle East but also in Arizona and northern Mexico. Now modern-day researchers are developing computer models to consider various water sources and losses, and soil and crop characteristics to calculate yield. Data for several stations in the Tucson, Arizona area confirm the validity of the model in varying degrees of conclusiveness. Results from field tests indicate that having good soil moisture conditions as crops germinate is an important factor in the production of a successful crop. Regardless of the collector-area to farmed-area ratio, the yield will be highly variable from year to year and crop failures will occur in certain years because of poor rainfall distribution. While useful as a supplementary cource, such a system is not a total substitute for irrigated agriculture. (Paylore-Arizona)

MUNICIPAL WATER PLANNING--MIXED INTEGER APPROACH,
Utah State Univ., Logan. Dept. of Civil Engineering.
T. C. Hughes, and C. G. Clyde.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY11, Proceedings paper No. 10131, p 2079-2095, November 1973. 2 fig, 9 tab, 14 ref, 3 append.

Descriptors: *Water distribution, *Water supply, *Alternative planning, *Computer programs, Hydraulics, *Municipal water, Optimization, Costs, Estimating, Water demand, Operating costs, Capital, Investment, Streamflow, Resource allocation, Constraints, Seasonal, Equations, Operations research, Mathematical models.
Identifiers: Mixed integer programming, *Cost minimization, Branch Bound concept, Uncertainty, Chance constrained programming.

A typical municipal water supply planning problem is to select a combination of water sources (some with randomly varying yield), physical facilities, and operating rules in order to supply the stochastic demand of several service zones. Each zone probably will have different growth characteristics and each demand will vary seasonally. This type of planning problem requires a finely-scaled model which may have as many decision variables as a multipurpose regional planning problem. Needed is a mathematical programming model capable of handling uncertainty in both supply and demand to optimize the investment in municipal water supply facilities. The mixed integer approach overcomes here many of the limitations of linear programming: it allows separation of capital investment and operating costs for detailed analysis of the least cost of insuring desired level of service. Standards of pipe and equipment require discrete, not continuous, variables. Presented is an optimizing algorithm based on the Branch Bound concept of mixed integer programming which selects the optimum combination of source-facilities from all possible alternatives. A model is developed for an example problem and the optimum solution is given. (Bell-Cornell)

METROPOLITAN WATER AND SEWER PLAN, LUBBOCK METROPOLITAN COUNCIL OF GOVERNMENTS.
Hudgins, Thompson, Ball and Associates, Inc., Lubbock, Tex.

Prepared for Lubbock Metropolitan Council of Governments, Lubbock, Texas, February 1969. 34 p, 2 fig, 10 tab. P-209.

Descriptors: *Planning, *Water supply development, *Sewerage, *Metropolitan studies, Sewage treatment, *Texas, Water resources development, Water resources, Forecasting, *Waste water treatment, Water reuse, Water importing, Imported water, Irrigation.
Identifiers: *Lubbock (Texas).

Guidelines are presented for use in evaluating engineering and planning development programs for water and sanitary sewer facilities for the Lubbock Metropolitan Council of Governments. Water supplies will need to be imported because natural precipitation is deficient. Without supplements to irrigation supplies, acreage under irrigation on the High Plains area is expected to decrease from 2.5 million acres in 1964 to 400,000 acres in 2020. Domestic demand for water is expected to increase from a 1970 level of 30 mgd to 81.4 mgd by the year 2000. Sewage flows are expected to increase from about 20 mgd to 62 mgd over the same period. It is recommended that a technical advisory committee be established to govern development of both water supply and sewerage plans, and that regional cooperation among communities be established. Future water rights must be preserved, and additional rights obtained. Secondary or tertiary wastewater treatment should be developed, and wastewater should be reused for irrigation, groundwater recharge or industrial applications. Industrial wastes should be pretreated to be compatible with the municipal sewage treatment plant. Rural areas should be provided with both water and sewers. Because of the high cost of these projects, estimated to cost over $26 million for water and $12 million for sewerage by 1990, it is recommended that all forms of financial assistance be developed. NORTHEAST GEORGIA AREA WATER AND SEWER SYSTEMS PLAN AND CAPITAL IMPROVEMENT PROGRAM.
Mayes, Sudderth and Etheredge, Inc., Atlanta, Ga.

Prepared for Northeast Georgia Area Planning and Development Commission, Athens, February 1973. 250 p, 16 fig, 11 tab, 5 append. GPA-GA-04-04-1002.

Descriptors: *Comprehensive planning, *Water supply, *Sewerage, *Regional development, Sewers, Water supply development, Data collections, Financing, *Georgia, Optimum development plans, Financial feasibility, Forecasting.

A comprehensive water and sewer plan was developed for the 10-county Northeast Georgia Area Planning and Development Commission. Located east of the City of Atlanta, this region is generally rural in nature and has had a population decline between 1930 and 1960. However, area population is now increasing, partially due to spinoffs from urban areas. The area includes about 3,000 square miles, and it had a 1970 population of 192,941. The population in the year 2,000 is expected to be about 306,000. Health hazards exist due to a lack of adequate water and sewer facilities. Many residents do not have public water on

sewerage services. Although existing water treatment facilities are maintained in better shape than the sewerage systems, many water systems are marginally operated. Large quantities of water are wasted through leakage. It was recommended that each county establish a county water and sewer authority, and that local water systems be encouraged to join its county authority. Intermim facilities are recommended for those areas where lack of sufficient developments prevents economical connection to the county system. Public education programs to obtain cooperation and connection to the water and sewer systems are recommended, because many residents presently prefer not to join existing systems. Financial and program implementation information is also provided. (Poertner)

FINANCING PRIVATE WATER RESOURCE DEVELOPMENT: ANALYSIS OF A STATE LOAN PROGRAM,
Wyoming Univ., Laramie. Div. of Agricultural Economics.
T. L. Dobbs, C. E. Olson, W. G. Wedemeyer, and G. H. Pfeiffer.
Available from the National Technical Information Service as PB-226 112, $2.75 in paper copy, $1.45 in microfiche. Research Report, 1972. 18 p, 4 fig, 2 tab, 10 ref. OWRR A-001-WYO (58), OWRR A-002-WYO (4).

Descriptors: *Water resources development, *Financing, *Loans, *State governments, *Wyoming, Sprinkler irrigation, Interest, Investment, Crops, Return (Monetary), Economic impact.

A marked decline in large scale Federally financed irrigation projects in such western states as Wyoming has led to investigation of alternative means of financing such projects through existing financial institutions and private investment. An economic analysis of the Wyoming State low-interest water development loan program for financing center-pivot sprinkler systems and groundwater development is presented. A feasibility analysis alternative means of financing the investments illustrates that the loan program was more attractive to investors than other alternatives and has stimulated the conversion of land from dry pasture and cropland to irrigated forage production. Whereas the state program accounts for the profitability of some forage production plans, sprinkler investments in sugar beets and potatoes are shown as highly profitable even under conventional financing. Simulation analysis indicates a significantly positive impact of sprinkler systems used for cash crops on economic viability of farm firms while those used for forage had less positive and sometimes a negative impact. Because a proportion of sprinkler investments were not dependent on the loan program the precise effects of sprinkler investments on regional development are difficult to ascertain although they are known to be positive. Steppes, Tetigonia-Viridissima, *USSR (Karshi steppe).

The 5 spp. of grasshoppers found in this area in the USSR, Tettigonia viridissima L., Decticus albifrons F., Platycleis intermedia Serv., Sememoviana pltnicovi Uv., and Conocephalus fuscus F., are potentially harmful insects to many field cultures, especially cotton and alfalfa. Three species of Grillidae, Gryllus desertus Pall., G. bimaculatus Deg., and G. burdigalensis Latr. are the most abundant crickets. Also widely distributed are G. pallipalpis (Tarb.), G. chivensis (Tarb.) Gryllodinus kerkennensis Fin., Pteronemobius heideni concolor Walk., P. gracilis Jak., and Bothriophlax semenovi (Mir.). The stalk cricket Oecanthus turanicus Uv. attacks technical cultures. The 2 mole crickets, Gryllotalpa unispina Sauss. and G. gryllotalpa L. live in moist areas. Cultivation and irrigation of the Karshi steppe, USSR, has promoted the increase of crickets, especially of the Gryllus L. and Gryllotalpa L. genera.--Copyright 1973, Biological Abstracts, Inc.

ANHYDROUS AMMONIA FOR FIELD CROPS: AN EVALUATION OF ANHYDROUS AMMONIA AS A NITROGEN SUPPLY FOR COTTON, CORN, RICE AND WHEAT,
M. T. Eid.
General Organization for Agricultural Crops Equilization Fund: Cairo, Egypt. 1972. 257 p. Illus.
Identifiers: *Ammonia (Anhydrous), Books, Corn, Cotton, *Fertilizers, *Field crops, Nitrogen, Nutrition, Rice, Soil Wheat, Hydrogen ion concentration, Egypt.

The feasibility of the use of anhydrous ammonia as a N supply for cotton, corn, rice and wheat in Egypt is discussed. Factors affecting changes of ammonium hydroxide applied to a clay loam soil, changes in soil pH as a result of ammonia application, N absorption by wheat and corn crops when supplied by ammonium nitrate and anhydrous ammonia injected in irrigation water are examined. Field experiments to evaluate anhydrous ammonia as a N fertilizer included in irrigation water, or applied directly to the soil, are described.--Copyright 1973, Biological Abstracts, Inc.

THE ACTION OF ABSCISIC ACID ON ION UPTAKE AND WATER FLOW IN PLANT ROOTS,
Sydney Univ. (Australia). School of Biological Sciences.
W. J. Cram, and M. G. IPitman.
Aust J Biol Sci. Vol 25, No 6, p 1125-1132. 1972, Illus.
Identifiers: *Abscisic acid, *Barley, *Ion uptake (Plants) *Maize, *Roots, Water flow.

Abscisic acid (ABA) inhibited transport of K+ and Cl- from the cut ends of excised barley and maize roots. Transport to the shoot of intact barley seedlings was also inhibited. Total uptake into the excised root of barley did not appear to be affected by ABA. There was an increase in tracer accumulated in the root accompanying the reduction in transport from the cut end. Concentrations of ABA above 10-6 M produced the maximum effect. Measurements of exudation from excised maize roots showed that ABA inhibited both water flow and net K transport into the exudate. The reduction in water flow was completely accounted for as an osmotic consequence of inhibition of K secretion, so that there was no evidence for an effect of ABA on the permeability of the root to water. The results are discussed in relation to the regulation of ion and water distribution within the whole plant.--Copyright 1973, Biological Abstracts, Inc.

TRICKLE IRRIGATION ON COTTON,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
D. A. Bucks, L. J. Erie, and O. F. French.
Progressive Agriculture in Arizona, Vol 25, No 4, p 13-16. July-August 1973, 1 fig, 3 tab, 6 ref.

Descriptors: *Irrigation systems, *Cotton, *Crop response, *Irrigation effects, *Arizona, Experimental farms, Furrow irrigation, Water requirements, Monitoring, Rates of application.
Identifiers: *Trickle irrigation.

The objective of this field investigation on cotton was to evaluate the effects of limiting quantities and varying frequencies of trickle irrigation for maximum crop production. Cotton was chosen because it is a crop which is an excellent indicator of moisture stress. One year's data was gathered and analyzed from the University of Arizona's Cotton Research Center in Phoenix, on a relatively fine-textured clay loam soil with a previous field history of barley for one year and cotton for three years previous to barley. Total fertilizer applied during the previous year and before planting was 420 lb/acre of urea, none thereafter. Criteria for trickle irrigation consisted of applying three quantitites, based on ratios of the plant's consumptive-use estimate, at three frequencies. These nine treatment combinations were replicated four times in a split-plot design. Results suggest that the amount of soil moisture needed by the cotton plant for high production with trickle irrigation is approximately equal to the present consumptive-use estmate for furrow irrigation, and that increased frequency of trickle irrigation may not necessarily increase yields on fine-textured soil. Identifiers: *Agro (Climates), *Bioclimates, Cultivars, Humidity, Photoperiod, Temperature, *Uruguay, *Wheat, Climatic data.

With the meteorological data available in Uruguay, the country was divided in areas according to the world wheat agroclimatic types. The country has 3 different areas with the common characteristic of photoperiod of short duration and lack of cold water. The northern part of the country is very humid during heading whereas the rest is humid. The temperature during ripening is warm in the northwest portion of the country and mild in the rest. The validity of the world wheat agroclimatic types in Uruguay was proved. The cultivars studied in the bioclimatic trials in the period 1965-1968 showed that the best adapted to the agroclimatic conditions of Uruguay were the early ripening cultivars of groups I and II and the late ripening cultivars of group II.--Copyright 1973, Biological Abstracts, Inc.

LEGAL AND INSTITUTIONAL CONSTRAINTS IN CONSOLIDATING IRRIGATION SYSTEMS,
Colorado State Univ., Fort Collins. Dept. of Economics.
G. E. Radosevich.
In: Optimization of Irrigation and Drainage Systems Proceedings, Irrigation and Drainage Specialty Conference, October 6-8, 1971, Lincoln, Nebraska, American Society of Civil Engineers, New York (1971), p 349-372. OWRR B-043-COLO (8).

Descriptors: *Irrigation systems, *Irrigation, *Water law, *Consolidation, Irrigation practices, Irrigation programs, Administrative decisions, Common law, Constitutional law, Judicial decisions, Legislation, Riparian rights, Water policy, Public rights, Arizona, Colorado, Nevada, Utah, Wyoming.

Legal doctrines and organizational arrangements relative to irrigation systems development, water supply and demand pressures and the role they play in irrigation systems consolidation are examined. The study is primarily concerned with the multitude of irrigation companies within a system and their complex interaction in distributing and applying water. The legal development of the right to use water is reviewed. The important point in the water rights picture is that mere possession of a water right may not guarantee any water to the right holder. Consolidation of irrigation companies, however, would bring together water rights of different priorities. The relevant substantive, administrative and procedural law of a number of states is examined. Conclusions are that the physical properties of the consolidation problem present no real threat and that the identified legal constraints are not impregnable. (Reed-Florida)

THE EFFECT OF SOIL MOISTURE UPON THE AVAILABILITY OF POTASSIUM AND ITS INFLUENCE ON THE GROWTH OF YOUNG MAIZE PLANTS (ZEA MAYS L.),
Landwirtschaftliche Forschungsanstalt, Buentehof (West Germany).
K. Mengel, and C. Von Braunschweig.
Soil Sci. Vol 114, No 2, p 142-148. 1972. Illus.
Identifiers: Diffusion, *Maize growth, Nutrients, *Pottassium, *Soil moisture, Zea-Mays.

The effect of soil moisture on the availability of K and its influence on plant growth was studied with young corn plants. The experiments were carried out with a split root technique in which the plants had to take up the K from a soil medium; the other nutrients and water were provided by a nutrient solution. Different water tensions in the soil were maintained. The experiment consisted of 4 pF water holding index treatments and 5 K treatments. The highest yields and the largest quantities of K taken up by the corn shoots were obtained at pF 2. With increasing water tensions (pF 2.4 and 2.7) the yields and the quantities of K uptake declined sharply. The yield level of the various pF treatments increased with an increase of the exchangeable K of the soil. A linear highly significant relationship was obtained between the K diffusion rates and the total K uptake of the plants. The yield depressions, effected by higher water tensions in the soil were due to a reduced K-availability caused by a restricted K diffusion. The diffusion rates depended mainly on the soil moisture and the K level of the soil respectively. Higher K applications counterbalanced the negative influence of higher pF values on the K diffusion to some extent. There was a highly significant linear correlation between the K content of the shoots and the yield.--Copyright 1973, Biological Abstracts, Inc.

APPLICABILITY OF THE INTERCEPTOR WATERWAY CONCEPT TO THE ROOKERY BAY SANCTUARY,
Tropical Bioindustries Development Co., South Miami, Fla.
E. J. Heald, and D. C. Tabe.
Available from the National Technical Information Service as PB-226 115, $2.75 in paper copy, $1.45 in microfiche. Rookery Bay Land Use Studies, Environmental Planning Strategies for the Development of a Mangrove Shoreline, Study No. 6. The Conservation Fundation, Washington, D.C. November 1973. 13 p, 3 fig. OWRR C-4022 (No. 9004) (1)., C-1817 (No. 3170) (1), and C-2201 (No. 3385) (1).

Descriptors: Bays, *Florida, *Land use, Nutrients, Environmental control, Marshes, *Waterways.
Identifiers: *Rookery Bay sanctuary (Fla), *Interceptor waterways.

The possibilities of stringent land use controls in the wetland regions surrounding the Rookery Bay Sanctuary probably reduce the neceesity for, and the applicability of, an Interceptor Waterway as a water management tool. However, the Waterway, intelligently located, can still perform a useful function as a spreader and redistributor of upland runoff into seaward marshes. The grographic area between Naples Bay and McIlvane Bay, west of U.S. 41, is discussed as a water management unit, and possible locations of interceptor waterways are suggested. Consideration is given to the possible environmental impact of nutrient-rich runoff waters on marsh areas if urban development and agricultural interests choose to rely heavily on marshes as biological filters.

DEVELOPMENT OF AN 'OPERATIONS' MODEL FOR MONTANA'S WATER RESOURCES: MIDDLE CREEK RESERVOIR OPERATION,
Montana State Univ., Bozeman. Water Resources Research Center.
T. T. Williams, and G. V. V. Rao.
Available from the National Technical Information Service as PB-226 119, $3.50 in paper copy, $1.45 in microfiche. Report No. 44, September 1973. 23 p, 6 fig, 4 ref, 6 append. OWRR A-056-MONT (1).

Descriptors: *Reservoir operation, *Water management (Applied), *Mathematical models, Water supply, Irrigation water, Flood control, Snow surveys, Computer models, Linear programming, Dynamic programming, *Montana, Optimization, *Reservoir releases.
Identifiers: *Hyalite reservoir (Mont).

Operational problems at Hyalite Reservoir, Montana were investigated in a one-year pilot study. Hyalite is a single-purpose (irrigation) reservoir which is normally filled from snow runoff in April, May and June, and normally depleted in July, August and September. Flooding on Hyalite Creek is not normally a serious problem. However, some flood control benefits could be realized by utilizing snow survey data obtained by the U.S. Soil Conservation Service. In years of high winter precipitation, spring filling should be delayed so as to insure storage availability at the time of runoff peak. Linear programming and dynamic programming procedures were presented to demonstrate the feasibility of optimizing reservoir releases over a four-season period. As applied to Hyalite Reservoir, the techniques are of limited use, because spring inflows are almost always adequate to completely fill the reservoir. The techniques will be valuable when applied to a larger basin such as the Musselshell, which is under further investigation.

FLOODPLAIN MAPPING AND PLANNING FOR THE 50 AND 100 YEAR INTERVAL FLOOD ZONES OF THE BITTERROOT VALLEY, MONTANA,
Montana Univ., Missoula.
N. K. Michael.
Available from the National Technical Information Service as PB-226 083, $4.25 in paper copy, $1.45 in microfiche. Montana University Joint Water Resources Research Center, Bozeman, Report No. 43, October 1973. 46 p, 9 fig, 32 plates, 5 tab, 13 ref, 4 append. OWRR A-064-MONT (1).

Descriptors: *Flood plain zoning, *Frequency analysis, *Photogrammetry, *Mapping, Flood plains, River basin development, *Montana, Hydrograph analysis, Planning.
Identifiers: Flood plain storage, Flood plain mapping, *Bitterroot River (Mont).

Flood hazard maps, delineating 50-year and 100-year flood plain areas, were prepared for an 80-mile reach of the Bitterroot River in Western Montana. Discharge rates corresponding to 50-year and 100-year recurrence frequency were obtained for six stations on the river using graphical methods suggested by the U.S. Geological Survey. River stage was monitored at 15 locations in the reach for a 14-day period during the June 1972 snowmelt runoff season to develop simulated rating curves. The rating curves were extended to encompass 50 and 100 year frequencies by plotting the data on semi-logarithmic paper and visually fitting the points to a straight line. Aerial photographs of the reach were taken on June 1, 1972 when the river was in flood stage but before the snowmelt peak had occurred. The photographs were used in conjunction with the ground control sites to establish flood boundaries corresponding to 50 and 100-year floods. The flood hazard maps thus produced cost an average of $51 per river mile, as compared to $400-1,000 per river mile reported by Wolman

(U.S. Geological Survey, 1972). Although less accurate, the maps developed in this study are believed adequate for most flood plain planning needs. (Williams-Montana)

STUDIES ON SEEPAGE FROM CANALS WITH PARTIAL LINING,
Indian Inst. of Tech., Kanpur. Dept. of Civil Engineering.
K. Subramanya, M. R. Madhav, and G. C. Mishra.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY12, Paper 10197, p 2333-2351, December 1973. 11 fig, 6 ref, append.

Descriptors: *Canal linings, *Canal seepage, Water loss, *Seepage, Leakage, Flow nets, Permeability, Porous media.

Seepage from partially lined trapezoidal canals in a homogeneous isotropic porous medium of large depth was studied using inversion of hodographs and the Schwarz-Christoffel transformation. The two cases studied are: (1) seepage from canals whose sides are lined but bottom unlined; and (2) seepage from canals whose bottom is lined but sides unlined. For every side slope of the canal there is a particular aspect ratio at which lining the sides or bottom results in the same reduction of seepage. For canals having an aspect ratio more than this, bottom lining is more effective and for a lesser aspect ratio, side lining will be more effective. For a canal having an aspect ratio of 9 and a side slope of 2.5:1, a 50% reduction in seepage is ensured by sealing the bottom. (Knapp-USGS)

GUIDE TO IMPROVEMENT OF ARIZONA RANGELAND.
Arizona Interagency Range Technical Sub-Committee, Tucson.

Bulletin A-58, University of Arizona, Cooperative Extension Service and Agricultural Experiment Station, October 1973. 93 p, 3 tab, 9 maps, 26 photos.

Descriptors: *Range management, *Land classification, *Arizona, *Brush control, Arid lands, Deserts, Mesquite, Range grasses, Brushlands, Forage grasses, Grama grasses, Wheat grasses, Grazing, Grasslands, Land management, *Land use, Environmental control, Planting management, Fertilization.

The publication is intended as a guide in the planning and application of proper range use, brush control, range seeding, and range fertilization practices on Arizona rangeland. The major land resource areas and environmental zones of Arizona are delineated and described in accordance with the national classification of the U.S. Department of Agriculture, Soil Conservation Service, in terms of vegetation, topography, soils, elevation, and climate. Proper range use is discussed in terms of grazing extent and forage production. Methods of evaluating proper range use are presented. Brush control practices are presented as mechanical and chemical alternatives. A table is presented with 16 major undesirable shrubs of Arizona and suggested treatments, with time of treatment and informative remarks concerning each. Range seeding practices are presented as lists and descriptions of preparatory and actual seeding procedures. Twenty-seven beneficial forage species recommended for Arizona are described, and environmental and planting conditions explained. For each of the zones, forage species are recommended by elevation and precipitation constraints. A short section is included on range fertilization recommendations for the Arizona environmental zones. An appendix tabulates common and scientific names of species. (Muller-Arizona)

WETLAND FILL-RESTRICTIONS DO NOT CONSTITUTE A COMPENSABLE 'TAKING' WITHIN THE MEANING OF THE FIFTH AMENDMENT,
C. Biunno.
Seton Hall Law Review Vol 4, p 662-282, 1973. 102 ref.

Descriptors: *Land use, *Public rights, *Wetlands, *Wisconsin, Constitutional law, Zoning, Permits, Environmental effects, Landfills, Drainage, Dredging, Natural use, Real property, Eminent domain, Legal aspects.
Identifiers: Shoreland zoning, Police powers.

The subject case (Just v Marinette County, 50 Wis. 2d 7, 201 N.W. 2d 761 (1972)) marks the first time a court has balanced the restrictions on an individual landowner which are implicit in land-use controls against harm to the environment that adversely affects the rights of the public. The county, acting pursuant to a statute granting counties authority for shoreland zoning, required a property owner to secure a conditional use permit for the filling, drainage, or dredging of wetlands. The Supreme Court of Wisconsin held that because of the special characteristics of the wetlands it was not an unreasonable exercise of the police power to prevent harm to public rights by limiting the use of private property to its natural uses. Cases dealing with the fifth amendment requirement of just compensation for the taking of land by the government are reviewed. By confronting the scope of the property owner's right to use his property as he wishes, the court in this case provided a viable and valuable rationale for courts in states where legislation has recently been enacted to protect coastal wetlands and where challenges regarding reasonableness of such regulations will presumably arise. The decision in the case gives the courts an 'environmental' theory to use in deciding when or whether a state should compensate owners for property losses inflicted by environmental land use regulation. (Sears-Florida)

OGUNQUIT SAND DUNE LAND STABILIZATION MEASURE, YORK COUNTY IN MAINE, THRESHOLD TO MAINE RESOURCE CONSERVATION AND DEVELOPMENT PROJECT (FINAL ENVIRONMENTAL STATEMENT).
Soil Conservation Service, Orono, Maine

Available from the National Technical Information Service as EIS-ME-73-0704 F, $4.00 in paper copy, $1.45 in microfiche. March 1973. 32 p, 1 map, 1 tab, 3 append.

Descriptors: *Maine, *Land management, *Land use, *Land development, *Erosion control, Vegetation establishment, Sand dunes, Sedimentation, Rivers, Sewage treatment, Wildlife habitats, Estuary, Environmental effects.
Identifiers: *York County (Me.), *Environmental Impact Statements, Coastal waters.

A proposed project in York County, Maine if for land stabilization consisting of restoring and stabilizing a twenty eight acre barrier dune through the placement of sand, plantings of vegetation and the installation of erosion and pedistrian control measures. The measure will reduce erosion on the Ogunquit Dune and Beach and also reduce sedimentation into the Ogunquit River, the Rachel Carson Wildlife Refuge, and the Ogunquit Village Sewer District Sanitary Sewage Treatment Plant. Increased stormwave protection will be provided to the sewage treatment plant and some mainland homes. Habitat will be restored and enhanced for a wide variety of shore birds and other wildlife. The shellfishery in the estuary will be maintained and enhanced. Increased employment and business expansion will result directly from project action. Restricted access to twenty eight acres of the dune and complete coverage of parts of the present dune by sand placement are the major effects of the measure. Loosended material will be trans-

ported to the river mouth during construction. Increased traffic, dust, noise, and road maintenance will result from vehicles involved in construction. (Sears-Florida)

FLOW ANALYSIS OF HYDRAULIC CONNECTORS IN ARTIFICIAL RECHARGE SYSTEMS, A MODEL STUDY,
Ohio State Univ., Columbus. Water Resources Center.
W. A. Pettyjohn.
Available from the National Technical Information Service as PB-226 069, $4.50 in paper copy, $1.45 in microfiche. Project Completion Report No. 336X, July 1973. 119 p, 56 fig, 7 tab, 22 ref. OWRR A-015-OHIO (1). 14-01-0001-1855.

Descriptors: *Artificial recharge, Hydraulics, *Groundwater movement, *Groundwater recharge, Injection wells, Pit recharge, *Hydrologic models, History, Water management (Applied), *North Dakota, Model studies, Recharge wells, Infiltration, Permeability.
Identifiers: *Hydraulic connectors.

Artificial recharge techniques have long been used to augment groundwater supplies and increase the yield of infiltration galleries. A case history of the water-supply situation at Minot, North Dakota, which has long suffered from severe water shortages, indicates the usefulness of artificial recharge. Throughout much of the Minot aquifer, the water level was raised more than 20 feet within six months of artificial recharge operation. The cost of the system (about $193,000) was minute in comparison to an estimates cost of $12 million for a pipeline to the Missouri River. A model study of the movement of a wetting front beneath an artificial recharge site, under both dry and damp conditions, illustrates the profound effect of permeability and stratification on the shape of the front. A model study dealing with the shape of the cone of recharge in the vicinity of a recharge well shows that there is a sharp change in gradient directly under the well. Elsewhere the cone develops a shape that is generally consistent with theoretical studies. Where the cone of recharge crosses a boundary, indicating a change in permeability, the cone is slightly distorted.

SYSTEMS ANALYSIS OF IRRIGATION WATER MANAGEMENT IN EASTERN IDAHO,
Idaho Univ., Moscow. Water Resources Research Inst.
C. E. Brockway, J. de Sonneville, J. A. Bondurant, and R. U. Worstell.
Available from the National Technical Information Service as PB-226 100, $6.25 in paper copy, $1.45 in microfiche. Completion Report, October 1973. 74 p, 32 fig, 2 tab, 9 ref. OWRR B-018-IDA (1). 14-01-001-3577.

Descriptors: *Groundwater, *Water management (Applied), Surface-Groundwater relationships, Water level fluctuations, Alluvial aquifers, Digital computers, Model studies, *Irrigation water, *Idaho, *Systems analysis, Regional analysis, Alternative water use, Seepage, Diversion, Water table.
Identifiers: *Snake River Fan (Idaho), Groundwater hydrology, Geohydrologic parameter calibration.

A water management study on a 96,000 acre irrigated tract in eastern Idaho was performed to develop techniques for regional water management studies and investigate alternatives for alleviating a high water table problem in the area. A complete water budget including irrigation diversions, system losses and wastes and crop and property damage was determined. A finite difference digital aquifer boundary includes an automated calibration routine to adjust aquifer parameters to fit historical water table elevations. This routine is especially useful on aquifers with limited hydrogeological data. Results indicate that canal seepage and above average irrigation application rates are the main causes of the rise of up to 40 feet in water tables during the irrigation season. Alleviation of the problem could be achieved with a 20% greater reduction in irrigation diversions or by lining of selected reaches of canals.
W74-02322

INTERBASIN TRANSFER OR MIGRATION: AN ECONOMIC ANALYSIS OF TWO RESPONSES TO GROUND WATER DEPLETION,
Kansas Water Resources Research Inst., Manhattan.
R. W. Ruppert, and G. S. Clausen.
Available from the National Technical Information Service as PB-226 066, $3.00 in paper copy, $1.45 in microfiche. Contribution No. 125, 1973. 31 p, 6 ref. OWRR A-039-KAN (1). 14-31-0001-3516.

Descriptors: *Inter-basin transfers, *Model studies, *Withdrawal, Economics, *Groundwater mining, *Kansas, *Migration, Benefits, Irrigation.

An area which depends upon ground water mining for a substantial proportion of its income faces three alternatives as its groundwater becomes depleted: (1) it can develop more water through alternative sources of supply as improved natural recharge, importation and artificial recharge, and waste water reuse; (2) it can transfer water use to less consumptive, higher-yield applications such as high-yield crops or manufacturing processes; (3) it can incur reductions in income and in population because of migration. An economic model which can be used to compare, from society's point of view, the first alternative and the third as responses to ground water depletion was studied. Should an area depleting its groundwater be encouraged to develop interbasin transfer of water or should it be encouraged to promote migration. In order to fully assess the nature of the costs of constructing or of abandoning facilities such as public buildings and roads and private factories or farm houses, a model of just the area would not be adequate. In order to study society's point of view it is necessary to imbed the model of the area within a model that takes into account the economic consequences of migration on the receiving area. Several conceptual models are developed that include migration, interbasin transfer, and ground water depletion. Some of the theoretical implications of the models are interpreted as they relate to the formulation of ground water resource pricing schemes. Some of the implications of the research findings for local ground water management districts are discussed. The research methods being employed to develop projections of water requirements for the state of Kansas are called into question.

WATER RESOURCES OF LEE COUNTY, MISSISSIPPI,
Geological Survey, Washington, D.C.
B. E. Wasson, and F. H. Thomson.
Water-Supply Paper 1899-B, Washington, D.C., 1970. 63 p, 19 fig, 9 tab, 26 ref.

Descriptors: *Water resources, *Data collections, *Mississippi, *Groundwater, Water supply, *Water quality, Water resources development, Planning, Water tables, Water management (Applied).
Identifiers: Lee County (Mississippi), Tupelo (Mississippi).

The water resources of Lee County (in northeastern Mississippi) were investigated in a 2-year study by the U. S. Geological Survey. All sources of water were appraised to provide a base of information to local water users and water utilities. Special attention was given to the quality of ground water in the Tupelo area. In this area, municipal and industrial water use has been the greatest and water levels have declined the most, approximately 3 to 5 feet annually. The 1960 population of the County was 40,589, of which 17,221 lived in Tupelo. Tupelo is largely industrialized, while the rest of the County is agricultural land or forested. Yearly temperatures range from about 12F to 100F, with an average temperature of about 63 degrees. Annual precipitation is about 53 inches. Water supplies are adequate to meet foreseeable needs. In the Tupelo area, water demand in 1967 from two aquifers was about 7 mgd and withdrawal could be doubled for sustained yield. Runoff management is also a feasible means of supplying needed water as runoff exceeds 1,000 acre-feet per square mile per year. Artificial recharge of aquifers with surface runoff appears to offer limited possibilities. (Poertner)

GROUNDWATER EXPLORATION AND PROVISION FROM THE HYDROGEOLOGICAL POINT OF VIEW,
Bundesanstalt fuer Bodenforschung, Hanover (West Germany).
G. Luettig.
In: Papers, International Symposium on Water Resources Planning, Mexico City, Mexico Volume III, December 1972, 25 p, 51 ref.

Descriptors: Groundwater, *Groundwater availability, Subsurface waters, Aquifer characteristics, *Aquifers, Groundwater recharge, *Groundwater resources, Hydrogeology, Saline water intrusion, Water storage, Water table aquifers, Surface-groundwater relationships, Arid climates, *Arid lands, Waste water disposal, Water pollution sources, Data collections, *Water quality.

The German Federal Geologic Survey has maintained advisory groups 19 arid countries throughout the world, as well as having conducted extensive hydrogeologic work in West Germany itself. Groundwater resources planning in Germany includes setting aside aquifers for future water development. In such regions, forestry and recreation are given priority over activities of greater water demand. The Survey also considers the impact of new procedures dealing with groundwater, such as solid and fluid waste disposal in aquifers, underground storage of oil and other bulk goods, salt water intrusion, disposal of radioactive wastes, and similar activities. From their overseas activities, dealing principally with the assessment and evaluation of groundwater resources in such arid regions as Iran, Jordan, Mauretania, Niger, Saudi Arabia, and in Latin America in Peru and Argentina, the German Survey recommends worldwide research in the inventorying of groundwater reserves and their quality, with a view of making that knowledge more widely known for necessary intelligent and far-seeing water resources development planning. USE OF DIGITAL COMPUTER TECHNIQUES IN WATER RESOURCES DATA STORAGE,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
W. G. Matlock.
In: Papers, International Symposium on Water Resources Planning, Mexico City, Mexico Volume III, December 1972, 19 p, 1 tab, 8 ref.

Descriptors: *Data collections, *Data storage and retrieval, *Hydrologic data, Information retrieval, *Well data, Computer programs, Computers, Documentation, *Arizona, Arid lands, Groundwater resources.

Data resulting from groundwater resources research in parts of Southern Arizona conducted since 1906 have been placed on punched cards and/or magnetic tape for storage, retrieval, and analysis. Included are well information such as annual water level measurements, yield, specific capacity, water quality and well location. Computer programs to print out the data in forms for various uses were developed. A software package was prepared for making contour maps of groundwater levels, water level changes, and other hydrologic variables. Applications of digital computer techniques in data analysis include: determination of the effect of data density on contouring accuracy, modeling groundwater recharge from an ephemeral stream channel, determination of aquifer specific yield and recharge, a finite difference groundwater basin model, and a model of runoff farming systems. Advantages of the digital computer data reduction and analysis system include savings in both time and money, reduced live storage space and fewer errors. Data are much more available to non-project personnel and other agencies. More detailed analysies, including statistical techniques, are now possible. (Muller-Arizona)

UNSTEADY DRAWDOWN AT A PARTIALLY PENETRATING WELL IN A TRANSVERSELY ISOTROPIC ARTESIAN AQUIFER,
University Coll. of Engineering, Hyderabad (India). Dept. of Civil Engineering.
D. B. Rao, G. M. Karadi, and R. J. Krizek.
Ground Water, Vol 11, No 6, p 44-49, November-December 1973. 3 fig, 5 ref.

Descriptors: *Drawdown, *Aquifer characteristics, *Artesian aquifers, *Anisotropy, Unsteady flow, Seepage, Aquifer testing, Computer programs, Equations, Permeability.

The effect of aquifer anisotropy on the unsteady drawdown at the face of a partially penetrating well which is pumped at a constant rate was studied analytically. The aquifer is confined between two parallel aquicludes, and its hydraulic conductivity is assumed to be transversely isotropic. Based on a parametric study of the drawdown equation, it is concluded that the variation in drawdown depends on which of the principal permeabilities is held constant, as well as the ratio between them. For constant radial permeability, the rate of increase of drawdown with time is independent of the permeability ratio; furthermore, unless the well penetration is very small, aquifer anisotropy is of little consequence for permeability ratios close to unity. For constant vertical permeability, well penetration has practically no influence on the drawdown for lower permeability ratios. The effect of aquifer anisotropy increases from a negligible value for a fully penetrating well to a maximum for wells which just tap the aquifer. (Knapp-USGS)

GROUND-WATER RECHARGE FOR URBAN USE: LEAKY ACRES PROJECT,
Agricultural Research Service, Fresno, Calif. Ground Water Recharge Field Station.
H. I. Nightingale, and W. C. Bianchi.
Ground Water, Vol 11, No 6, p 36-43, November-December 1973. 7 fig, 4 tab, 11 ref.

Descriptors: *Artificial recharge, *California, *Recharge ponds, Irrigation water, Infiltration, Water management (Applied), Alluvium, Municipal water.
Identifiers: San Joaquin Valley (Calif), Fresno (Calif).

Problems associated with the use of agricultural surface water for artificial groundwater recharge to maintain an urban groundwater supply are studied at the Leaky Acres Recharge Project in Fresno, California. Groundwater recharge and agricultural technologies are combined to recharge available irrigation water through agricultural soils of known chemical, geologic, and hydrologic properties. Leaky Acres has 47.4 ha of ponding surface in 10 basins. During 1971 and 1972 recharge seasons not all ow the area was in operation at one time; a total of 17,150,000 cu m of high quality water was recharged. The 1972 average intake rate was 17.5 cm per day. Changes in groundwater

quality related to soil leaching during recharge should result in eventual improvement of the regional groundwater quality. (Knapp-USGS)
W74-02468

SHALLOW GROUND WATER IN THE ZAMIN DAWAR AREA, HELMAND PROVINCE, AFGHANISTAN,
Geological Survey, Washington, D.C.
N. E. McClymonds.
Open-file report, January 1972. 103 p, 21 fig, 14 tab, 7 ref.

Descriptors: *Groundwater resources, *Water wells, *Water yield, *Hydrogeology, *Foreign research, Water utilization, Withdrawal, Water table, Aquifer characteristics, Hydrologic cycle, Streamflow, Surface-groundwater relationships, Precipitation (Atmospheric), Water quality, Hydrologic data, Rainfall-runoff relationships, Water resources development.
Identifiers: *Helmand Province (Afhanistan).

Groundwater conditions are evaluated in the Zamin Dawar area which lies between Kajakai Reservoir and Musa Qala Rud (river) in south-central Afghanistan, about 90 km northeast of Lashkar Gah. The area comprises two mainstream drainage areas: that of Gulmesh Mandeh (ephemeral stream) to the east which includes mostly plains with low hills on the east and north slopes and a high limestone scarp on the west slope; and Baghni Rud to the west which drains a mountainous area to the north and spreads onto a large alluvial fan with distributaries leading both to Helmand Rud to the southeast and Musa Qala Rud to the west. During the investigation in 1971, data showed that the karezes yield a total of about 20,000 ac-ft of water per year. The springs on the plains yield about 3,000 ac-ft and the wells about 300 ac-ft per year. The inventoried springs in Baghni valley yield about 6,500 ac-ft per year, and supply about 70% of the total water used in the valley. The total amount of water used in the Zamin Dawar area in 1971 was about 32,000 ac-ft (40 million cu m). This amount of water was used to irrigate about 10,000 jiribs (approximately 5,000 acres or 2,000 hectares) of cultivated land and served a population of about 40,000 people. (Woodard-USGS)

EFFECTS OF HIGHWAY BRIDGE CONSTRUCTION ON A SUBARCTIC STREAM,
L. A. Peterson, and D. Nyquist.
The Northern Engineer, Vol 4, No 2, p 18-20, Winter 1972. 2 fig, 1 tab, 10 ref. OWRR B-017-ALAS (5).

Descriptors: *Environmental effects, *Water quality, *Ecosystems, *Bridge construction, *Alaska, Streambeds, Baseline studies, Correlation analysis, Chemical analysis, Aquatic animals, Aquatic plants, Data collections, Evaluation, Water quality control.
Identifiers: *Goldstream Creek (Alaska).

Effects of construction of roads and highways along and over flowing waters and the subsequent reduction in water quality and disturbance of the associated flora and fauna have been the focal point of much heated debate in the United States. The effects of construction of a highway bridge over Goldstream Creek in central Alaska are discussed. Goldstream Creek in the past has been subjected to extreme environmental damage, both aquatic and terrestrial, due to past gold dredging and placer mining operations. The stream has been rerouted to facilitate the mining operations. The terrestrial vegetation has never recovered; however, the aquatic exosystem seems to have fared better. Young grayling were observed in Goldstream Creek in 1971. Presently, Goldstream Creek does not contain a viable sports fishery. The changes in water quality and bottom organisms between August 1970 and October 1971 are described. (Woodard-USGS)

PRESCRIBED FIRE EFFECTS ON WATER REPELLENCY, INFILTRATION AND RETENTION IN MIXED-CONIFER LITTER, DUFF AND SOIL,
California Univ., Berkeley. School of Forestry and Conservation.
H. H. Biswell, and J. K. Agee.
Available from the National Technical Information Service as PB-226 225 $2.75 in paper copy, $0.45 in microfiche. University of California Water Resources Center Completion Report, Nov. 1973, 5 p. OWRR A-044-CAL and B-151-CAL (2).

Descriptors: *Forest Management, *Erosion Control, *Forest fires, *Sediment control, *Water yield improvement, Forest soils, Water conservation, Watershed management, *California.

Prescribed fires were applied to ponderosa pine-incense-cedar and white fir-giant sequoia ecosystems in the southern Sierra Nevada. Aerial and heavy fuels were not affected, but weight, depth, and water-holding capacity of fine fuels were reduced. Forest floor wettability was altered, and some water repellency was transferred to the soil. Soil physical properties were slightly affected: one index of soil water repellency, the capillary rise index, increased. Another index, the water drop penetration time, was not increased. Bulk density was not affected, and even though per cent carbon slightly decreased, the grams per square meter of carbon was not affected. Water runoff, and to a lesser degree sediment yield, were increased by burning. The increases were most highly correlated to the decrease in the forest floor. A computer model using depth of forest floor as an index of runoff and erosion hazard was developed and showed that prescribed fires could be used in ecosystem management without generating erosion hazards of significance. Professional wildlife managers can use the results to simplify the measurement of fire intensity and fuel loading, and to meet the objectives of burning programs while minimizing erosion hazards. HYDROLOGIC AND WATERSHED MODELING FOR WATERSHED PLANNING,
Soil Conservation Service, Portland, Oreg.
D. E. Woodward.
Transactions of the ASAE, (American Society of Agricultural Engineers), Vol 16, No 3, p 582-584, 1973. 8 ref.

Descriptors: Water resources, *Planning, Hydrology, *Conservation, *Computer programs, *Simulation analysis, *Watersheds (Basins), Constraints, *Optimum development plans, Runoff, Reservoir storage, Structures, Earth dams, Hydrographs, *Mathematical models, Systems analysis.
Identifiers: Peak flow.

For the optimum development of land and water resources, future use of hydrologic simulation models as evaluation tools is a necessity. With the advent of high speed computers, more-highly sophisticated modeling is possible, i.e., the ability to consider greater detail in the standard procedures and a greater number of parameters in solving hydrologic problems. The Soil Conservation Service (SCS) has formulated hydrologic and watershed models for the planning and design of conservation measures. These models and the role various organizations have played int their development are described. The basin simulation model developed under contract with the Desert Research Institute in Reno, capable of simulating the major elements of the annual hydrologic cycle, is discussed in detail. Described also are: the SCS computer model developed to evaluate the effects of proposed structural measures on peak flow; and the SCS structure site analysis (computer) program, developed to proportion earth dams and determine the required quantities for a wide range of conditions (using reservoir storage-discharge data to route inflow hydrographs through a potential reservoir and to proportion the structure according to SCS criteria). THE RELATIONSHIPS BETWEEN LAND USE AND EROSION IN THE CENTRAL NORTH ISLAND, NEW ZEALAND,
Waikato Univ., Hamilton (New Zealand). Dept. of Earth Sciences.
M. J. Selby.
Journal of Hydrology (New Zealand), Vol 11, No 2, p 73-87, 1972. 1 fig, 1 tab, 26 ref.

Descriptors: *Erosion, *Land use, *Erosion control, Grazing, Runoff, Gullies, Gully erosion.
Identifiers: *New Zealand (North Island).

Yellow-brown pumice soils cover a large area of the central North Island of New Zealand. Since land development started in the mid 1930s approximately 4000 sq km have been converted from the native vegetation to exotic forests and pasture. Since about 1959 gully erosion has become more common and widespread. Surface-water runoff is greater from developed land in pasture and less from areas covered by scrub and ungrazed grass vegetation. The major causes of runoff from pastures are very intense rainfall on a soil with low moisture content. Modifications of soil properties, especially compaction caused by animals and vehicles, decrease infiltration and hence promote runoff. Soil particles are easily entrained by running water, but plant roots inhibit this process. Analysis of data from the three experiments indicates that land development should be carried out so that: (a) a close vegetation cover is kept on all soils; (b) channel development is avoided; (c) vulnerable areas such as valley floors and steep valley sides are kept as water absorption areas; (d) animals and vehicles are excluded from water absorption areas to prevent soil compaction; (e) plants with strong and dense root systems are used to protect surface soils. (Knapp-USGS)

THE IMPORTANCE OF SEDIMENT TRANSPORT IN WATER RESOURCES PLANNING,
Arizona Univ., Tucson.
S. Ince.
In: Papers, International Symposium on Water Resources Planning, Mexico City, Mexico Volume III, December 1972, 12 p.

Descriptors: *Sedimentation, *Geomorphology, *Sediment transport, *Planning, Water supply development, Sediment control, Sediment distribution, Sediment load, Silting, Sediment yield, Geology, Erosion, Running Waters, Drainage, Environment, Projects, Engineering structures.

Erosion, transportation and deposition of sediments is a natural state of the earth's surface. Human interference into this cycle causes discontinuities, and sets into motion a new chain of events sometimes with surprising rapidity and with unexpected geomorphological and economic consequences. The reason for this may at times be lack of precise knowledge, but more often than not it is due to the narrow objectives set for the construction of engineering works. Thus a design aimed at only reducing flood damage, may have geomorphologically and economically harmful effects upstream and downstream. If, however, the planning is on a broad scale and geomorphology is considered as an intregral part of any water resources development scheme, it is possible to foresee and take into account the geomorphological changes that could result, assess their environmental and economical consequences, the suggest measures to prevent a drastic change in geomorphology. The judicious planning of water resource systems aimed at maintaining and improving the geomorphology will require not only greater emphasis on the sediment transport problem, but will result in a broader concept of economic analysis. ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR GREEN CREEK, BRAZOS RIVER BASIN, TEXAS, 1971,
Geological Survey, Austin, Tex. Water Resources Div.
B. B. Hampton.
Open-file report (Texas District), August 1973. 30 p, 2 fig, 3 tab.

Descriptors: *Erosion control, *Flood protection, *Retaining walls, *Hydrologic data, *Texas, Small watersheds, Rainfall-runoff relationships, Basic data collections, Rain gages, Streamflow, Gaging stations, Flow rates, Water yield, Sediment control, Soil conservation, Storm runoff, Watershed management.
Identifiers: *Brazos River basin (Tex), Green Creek (Tex).

The U.S. Soil Conservation Service is actively engaged in the installation of flood- and soil-erosion reducing measures in Texas. Hydrologic investigations of small watersheds were begun by the U.S. Geological Survey in 1951 and are now being made in 12 study areas. This report contains the rainfall, runoff, and storage data collected during the 1971 water year for the 46.1-square-mile area above the stream-gaging station Green Creek near Alexander. There are eight floodwater-retarding structures in the Green Creek study area with a total combined capacity of 7,500 acre-feet below the flood-spillway crests, and they control 22.3 square miles, or approximately 50% of the drainage area above the stream-gaging station. The weighted-mean rainfall over the area during the 1971 water year was 19.97 inches, or 63% of the 1931-60 long-term mean annual rainfall of 31.67 inches. The yearly mean discharge at the stream-gaging station Green Creek near Alexander was 1.13 cfs, compared with the 13-year (1959-71) average of 6.03 cfs. The annual runoff was 818 acre-feet. One storm period (May 28, 1971) was selected for detailed analysis and computation. These computations include a detailed time breakdown of rainfall and discharge. (Woodard-USGS)

5A. Identification of Pollutants

DETECTION OF POLLUTANTS IN WATER BY RAMAN SPECTROSCOPY,
Brown, Boveri und Cie, A.G., Heidelberg (West Germany).
G. Braunlich, G. Gamer, and M. S. Petty.
Water Research, Vol 7, No 11, p 1643-1647, November 1973. 2 fig, 8 ref.

Descriptors: *Pollutant identification, *Spectroscopy, *Fluorescence, Water pollution, Analytical techniques.
Identifiers: *Raman spectroscopy.

The possibility of monitoring pollutants in water by means of Raman spectroscopy is discussed with special reference to the CH-stretching vibration bands of possible impurities. From theoretical considerations the limits of detection were found to be in the range of 1 to 10 ppm. The perturbations due to fluorescence and turbidity in samples were investigated and methods for reducing their effects are discussed. (Knapp-USGS)
W74-02164

QUICK-TIME INSTRUMENTAL MEASUREMENTS OF WASTEWATER ORGANIC CHARACTERISTICS,
Connecticut Univ., Storrs. Dept. of Civil Engineering.
T. Helfgott, and F. L. Hart.
Paper presented at the London Workshop of the International Association on Water Pollution Research on 'Instrumentation, Control and Automation for Wastewater Treatment Systems,', September 17-21, 1973. 16 p, 1 fig, 2 tab, 10 ref.

Descriptors: Instrumentation, *Statistical models, *Measurements, Organic wastes, Waste water (Pollution), *Biochemical oxygen demand, Ammonia, Nitrates, Regression analysis, Treatment

facilities, Domestic wastes, Pollutant identification.
Identifiers: Quick-time, Real-time, *Total oxygen demand, *Total organic carbon, *Total nitrogen.

A rationale for replacing the Biochemical Oxygen Demand either 5-day, ultimate or ultimate carbonaceous by quick-time (real-time) measures of organic pollution is presented. Quick-time measures of organic pollution include Total Oxygen Demand, Total Organic Carbon, Total Nitrogen and ion selective probes for measuring ammonia and nitrates. Four statistical models are presented to illustrate the interrelations that can be made with quick-time measurements. Correlation coefficients for the various regression analyses are presented for the four statistical models. Pitfalls in using correlations include misinterpretation (e.g., BOD cannot measure persistence) and statistical artifact (e.g., using unrelated microbial populations for BOD data). It is suggested that the quick (real-time) measure of pollution replace BOD in the operation of wastewater treatment plants.

SURFACE QUALITY ASSESSMENT OF NATURAL BODIES OF WATER,
Calspan Corp., Buffalo, N.Y.
R. E. Baier.
Proc. 13th Conf. Great Lakes Research, 1970; p 114-127. 7 fig, 36 ref.

Descriptors: Lakes, Oil, Water pollution sources, *Pollutant identification, *New York, *Spectroscopy, Bubbles, *Oil pollution, Instrumentation, Air-water interfaces, Films.
Identifiers: *Lake Chautauqua (N.Y.), *Buffalo River (N.Y.).

Multiple attenuated internal reflection (MAIR) spectroscopy is sensitive to surface films as thin as monolayers transferred from air/water interfaces. Repetitive surface samples have been obtained from natural bodies of water by a simple dip technique with variations in Langmuir-Biodgett transfer mechanisms used to favor single film or multilayer deposition. During the 1969 recreational season on Lake Chautauqua, the method demonstrated such phenomena as weekend 'bursts' of hydrocarbon surface pollutants associated with peak recreational activity, rapid natural 'cleansing' of the Lake surface, recognition of proteinaceous substances as major components of bubbles marking wind streaks in the Lake, and of billowing foam accumulated along the windward shore. Application of the method to the Buffalo River demonstrated trapping of surface oil in the upper river segments, with only minor outflow of oily surface pollutants into Lake Erie.

ORGANIC FILMS ON NATURAL WATERS: THEIR RETRIEVAL, IDENTIFICATION, AND MODES OF ELIMINATION,
Calspan Corp., Buffalo, N.Y.
R. E. Baier.
Journal of Geophysical Research, Vol 77, No 27, p 5062-5075, Sept. 1972. 5 fig, 16 ref.

Descriptors: *Films, *Pollutant identification, Air-water interfaces, Bubbles, *Spectroscopy, *New York, *Oily water, Separation techniques, Water pollution control.
Identifiers: *Bubble-Film-Stripping Mechanism, Organic films, *Lake Chautauqua (N.Y.).

Air-water interfacial films were sampled and subjected to nondestructive analysis by multiply attenuated internal reflection (MAIR) infrared spectroscopy. A field program on Lake Chautauqua in western New York correlated the buildup of oily films over the lake surface with peak boating activity and demonstrated the rapid elimination of such pollutant layers by natural mechanisms. A laboratory program to assess the relative efficiencies of various processes for film degradation included studies of the influence of ultraviolet-visible irradiation, capillary-wave action, bacterial activity, and bubble breaking. Bubble breaking and its concomitant ejection of film fragments into the air was by far the most efficient process, especially when simultaneous irradiation accelerated the formation of polar moieties in the films. Chemical fractionation by this mechanism has also been demonstrated, with the more polar organic components and their associated inorganic elements being stripped from the interface preferentially. Thus, air-sea interfacial films are implicated in sea-to-air material transport and in the chemistry of marine aerosols.

USE OF SEPHADEX GEL FOR THE FRACTIONATION OF ORGANIC MATTER IN LAKE WATER, (IN RUSSIAN),
Akademiya Nauk Estonskoi SSR, Tartu. Inst. of Zoology and Botany.
A. Lindpere, and K. Simm.
Eesti Nsv Tead Akad Toim Biol. Vol 21, No 3, p 242-249. 1972. Illus.
Identifiers: *Fractionation, Lakes, *Organic matter, *Sephadex gel filtration, Weight, *Separation techniques, Elution profiles.

Sephadex gel filtration was used for the fractionation of organic color in the different types of lake water. All water samples were collected in winter, concentrated by freezing at -3C, and fractionated on Sephadex G-25 with distilled water as an eluant. Color absorption measurements were made at 225 m micro. In each case the organic substances were separated into 3 peaks, differing in molecular size. The elution profiles of organic matter for the same types of lake water were similar, and they contained the same components. The elution profiles for the water of different lake types were different. The organic matter of dystrophic lakes contained larger quantities of compounds of large molecular weight than those of oligotrophic and eutrophic lakes.--Copyright 1973, Biological Abstracts, Inc.

SEPARATION AND IDENTIFICATION OF METAL DITHIZONATES BY THIN-LAYER CHROMATOGRAPHY AND ITS APPLICATION IN TOXICOLOGICAL ANALYSIS,
Chemical Examiner's Lab., Agra (India). Toxicology Div.
S. N. Tewari, and N. Bhatt.
Mikrochimica Acta, No 3, p 337-340, 1973. 1 tab, 6 ref.

Descriptors: *Separation techniques, *Pollutant identification, *Heavy metals, Methodology, Solvent extractions, Chemical analysis, Toxins, Lead, Copper, Mercury, Cadmium, Zinc, Manganese, Nickel, Cobalt.
Identifiers: *Thin layer chromatography, Biological materials, *Organic solvents, *Metal dithizonates, Complexation, Toxicology, Metal complexes, Biological samples, Toluene, Xylene, Benzene, Carbon tetrachloride, Chloroform.

A quick and reliable method has been developed for the detection of toxic metals present in autopsy tissues and other biological materials, by complex formation and thin-layer chromatography. The study was restricted to the metal ions which form complexes with dithizone and are extractable at (1) pH 1-4 (i.e. Cu, Hg, Cd) and (2) pH 6-8 (i.e. Pb, Zn, Mn, Ni, Co). The thin-layer chromatographic investigation was carried out on Silica Gel-G plates. Autopsy tissues suspected of containing Cu were treated with a chloroform solution of dithizone with the pH of the medium being maintained between 1 and 4. Four developing agents were tested: carbon tetrachloride: chloroform (10:4), toluene, xylene, and benzene. No spray reagents were required as the spots of the metal complexes on the plates were colored. The R sub f values of the common metal complexes in the 4 solvents and the color of their respective spots on the TLC plates are given. (Holoman-Battelle)

DETERMINATION OF TRACE FLUORINE IN BIOLOGICAL MATERIALS BY PHOTONUCLEAR ACTIVATION ANALYSIS,
National Inst. of Radiological Sciences, Chiba (Japan).
S. Ohno, M. Suzuki, M. Kadota, and M. Yatazawa.
Mikrochimica Acta, No 1, p 61-68, 1973. 3 fig, 3 tab, 16 ref.

Descriptors: *Fluorine, *Soil analysis, *Rice, Separation techniques, Water analysis, Air, Vegetable crops, Radioactivity techniques.
Identifiers: Sample preparation, *Photonuclear activation analysis, *Spinach, Chemical interference, Precision, Recovery, Detection limits, Biological samples.

Spinach leaves and rice were prepared for photonuclear activation analysis of fluorine by freeze drying, pulverizing, evaporating with NaOH, fusing the residue with sodium peroxide, dissolving the fused cake in distilled water, centrifuging, and adjusting the supernatant to pH 6-7.

Powdered soil was prepared by fusing with sodium peroxide and following the procedures used for the plant samples. Sample solutions were then passed through an ion exchange resin (Dowex 1X8 and 50WX8) which was dried and sealed in a polyethylene bag for irradiation. Fluorine-18 was separated by adding a fluorine carrier solution and HCl to the sample, filtering, transferring the filtrate to a separation funnel and extracting with dimethyldichlorosilane in xylene. Activity was then measured on a TMC 100-channel pulse height analyzer and the results compared with those from standard solutions. Recoveries ranged from 85 to 91 percent, the detection limit was about 0.01 microgram, and precision was about plus or minus 11 percent. The extraction procedure apparently eliminated interference from iodine, bromine, and chlorine. The method is applicable to air, water, and other environmental materials in addition to biological and geological materials. (Little-Battelle)
W74-02361

EXTRACTION AND SPECTROPHOTOMETRIC DETERMINATION OF VANADIUM AS A MIXED LIGAND COMPLEX OF OXINE AND AZIDE,
Andhra Univ., Waltair (India). Dept. of Chemistry.
V. P. R. Rao, and Y. Anjaneyulu.
Mikrochimica Acta, No 4, p 481-490, 1973. 7 fig, 23 ref.

Descriptors: *Separation techniques, *Spectrophotometry, *Aqueous solutions, Heavy metals, Absorption, Colorimetry, Color.
Identifiers: *Vanadium, *Complexation, Sensitivity, Complexing agents, Chemical interference, Free energy of formation, Organic solvents, Magnetic moments, Recovery.

Vanadium, oxine and azide react at pH 3.5-4.5 to give a dark green solid which extracts into benzene giving dark green solution. The extract has absorption maxima at 415 nm and 620 nm with molar absorptivities 8650 and 6040 respectively. Spectrophotometric investigations reveal that the extracting species has V, HOx, and N3 (-) in the ratio 1 to 2 to 2. Beer's law is obeyed up to 8.10 micrograms and 10.50 micrograms of vanadium per ml at 415 nm and 620 nm, respectively. The sensitivity of the color reaction is 0.0065 microgram per sq cm at 415 nm and 0.009 microgram per sq cm at 620 nm. The percent extraction of V was found to be 90. The formation constant and the free energy of formation are 8.3 to 8.7 times 10 to the 6th power and -9.91 to -9.31 Cal respectively at 30 C. The interference of various foreign ions was studied and methods are proposed for the elimination of the interference of some of those substances. Infrared and magnetic data of the solid complex are given. (Little-Battelle)

PYRIDINE KETOXIMES AS ANALYTICAL REAGENTS: THE SPECTROPHOTOMETRIC DETERMINATION OF COBALT WITH 2--PYRIDYL-2-THIENYL-BETA-KETOXIME,
Windsor Univ. (Ontario). Dept. of Chemistry.
H. R. Notenboom, W. J. Holland, and R. G. Billinghurst.
Mikrochimica Acta, No 3, p 467-473, 1973. 1 fig, 2 tab, 19 ref.

Descriptors: *Spectrophotometry, *Cobalt, *Pollutant identification, *Aqueous solutions, *Chemical analysis, Methodology, Solvent extractions, Hydrogen ion concentration, Time, Chelation, Fluorides, Synthesis, Anions, Cations.
Identifiers: *Chromogenic reagents, 2-Pyridyl-2-thienyl-beta-ketoxime, *Trace levels, Chemical concentration, Ionic interference, Metal chelates, Sample preparation, Precision, Accuracy, Chemical concentration, Pyridine ketoximes, Chemical interference, Organic solvents, Characterization, Hydrochloric acid, Chloroform, Dichloromethane, Methyl isobutyl ketone, Benzene, Hexane, Carbon tetrachloride, Permanganates, Chromates, Disodium EDTA, Palladium, Platinum.

The synthesis and characterization of 2-pyridyl-2-thienyl-beta-ketoxime (I) and its application to the spectrophotometric determination of trace amounts of cobalt by extraction of the resulting chelate from strong hydrochloric acid solution into chloroform are described. Under the conditions of analysis the chelate has a maximum absorbance of 412 nm with a molar absorptivity of 20,000 and a Sandell sensitivity of 0.0029 microgram/sq cm. The optimal pH range for chelate formation was 7.0-10.8; the addition of sufficient HCl to make the sample solution 1.2-3.4 M gave reproducible results. The Co chelate in 3 M HC1 was stable for at least one week and the chloroform extracts for at least 2 hours. As little as 0.5 ml of reagent solution gave reproducible results. The chelate was completely extractable into chloroform and dichloromethane, partially extractable into methyl isobutyl ketone and benzene and non-extractable into hexane and carbon tetrachloride. A large number of ions did not interfere with the analysis; however, permanganate, chromate, disodium EDTA, fluoride, palladium, and platinum (2 and 4 plus) ions seriously interfered and must be absent from all determinations. B. Egneus, and L. Uppstrom.
Analytica Chimica Acta, Vol 66, No 2, p 211-229, September 1973. 12 fig, 9 tab, 23 ref.

Descriptors: *Separation techniques, *Solvent extractions, *Methodology, *Aqueous solutions, Chelation, Boron, Chemical properties, Hydrogen ion concentration, Inorganic compounds, Infrared spectrophotometry, Nuclear magnetic resonance, Pollutant identification.
Identifiers: *Boric acid, *Chelating agents, *Chemical recovery, *Aliphatic 1 3-diols, Infrared spectra, NMR spectra, Ultraviolet spectra, Aliphatic hydrocarbons, Reagents, Organic solvents, Esterification, Ketones, Amines, Sample preparation, Inorganic acids, Ultraviolet spectrophotometry, Phenylethanediol-1 2, Propanediol-1 3, Catechol, 2 2'-Dihydroxybiphenyl, o-Hydroxyacetophenone, 4 4'-Methylene-bis (3-hydroxy-2-naphthoic acid), Benzoylacetone, 1 2-Cyclohexanedione, 2-Pyridylmethylacetate, 2-Pyridineethanol.

Some 40 compounds have been investigated with reference to their boric acid extraction properties. Preliminary tests showed that aliphatic 1,3-diols with at least 6 carbon atoms possess superior extraction qualities compared to diketones, hydroxyketones, hydroxyamines and other species investigated. The 1,3-diols were then further studied with attention to size and steric configuration. The extraction equilibria involved were thoroughly investigated for 2,2-diphenylpropanediol-1,3 (DPPD). The constants derived showed that this diol, in spite of its large hydrophobic groups, has a smaller reaction constant than the previously investigated 2,2-diethylpropanediol-1,3 (DEPD) and 2-ethylhexanediol-1,3 (TMPD), which seems to form a very stable ester with boric acid in chloroform at room temperature. The ester formation is supported by n.m.r. and i.r. spectra. The effect of geminal substituents in the 2-position is discussed. (Holoman-Battelle)

X. V. M. Snaddon, S. A. Mayo, and J. Cope.
Process Biochemistry, Vol 8, No 9, p 15-17, September 1973. 3 fig, 3 ref.

Descriptors: *Colorimetry, *Water analysis, *Instrumentation, *Automatic control, Design criteria, Chemical oxygen demand, Ammonia, Nitrites, Electronic equipment, Data processing, Monitoring.

A dual-beam colorimeter was developed to perform routine and continuous monitoring. The criteria for the system were that it be reliable, automatic correction of electronic drift be provided, discrimination between channels be provided with a means of detecting plateaus and peaks and converting these maxima into concentration units, results be displayed in digital form, and sample identification be included with results. The system consists of four basic sections: the input amplifiers, linearizer, and subtractor; and analog to

digital converter and maximum memory system; the digital output stage; and the power supplies. The optical system is designed to withstand dropping without damage. Results of determinations of COD agreed closely with those obtained by other methods. Use of the system to determine ammonia-nitrogen and nitrite revealed that temperature variations and oxidation of reagents affected results. Suggestions are given for coupling alarms, automatic shutoff, and data accumulation systems to the colorimeter. (Little-Battelle)

Identifiers: *Crude oil, *Heavy distillates, *Oil characterization, Gach Saran crude oil, Chemical composition, Petroleum distillates, Saturates, Monaromatics, Diaromatics, Polyaromatic-polar compounds, Chemical treatment, Isothermal distillation, Boiling point, Aromatic hydrocarbons, Petroleum hydrocarbons, Gel permeation chromatography, Mass spectra, Silica-alumina gel chromatography, Liquid solid chromatography, Ion exchange resins, Polyaromatics, Gradient elution adsorption chromatography, NMR spectra, Molecular distillation.

A systematic procedure which utilizes isothermal and molecular distillation, chemical treatment, silica-alumina gel chromatography, gel permeation chromatography and spectrometry has been developed for the separation and characterization of heavy ends of petroleum. Some aspects of the procedure are described and applied to a 370-535 C (700-1000 F) distillate from Gach Saran, Iran, crude oil. In this application chromatography is utilized through anion and cation exchange resins to separate acids and bases, followed by chemical treatment with FeC13 to remove neutral nitrogen compounds. The distillate, then essentially free of acids, bases and neutral nitrogen compounds, is passed through a dual silica-alumina gel adsorption column, using gradient elution, to produce four well-defined concentrates; namely, saturates, monoaromatics, diaromatics and polyaromatic-polar compounds. Mass spectra were used to identify the general composition of each concentrate. A combination of gel permeation, mass spectrometric and nuclear magnetic resonance data was then used to further evaluate the adsoprtion concentrates of the distillate. The entire procedure is schematically outlined. (Holoman-Battelle)

CHARACTERIZATION OF WASTE EFFLUENTS FROM A COMMERCIAL PIMENTO CANNING OPERATION,
Georgia Experiment Station, Experiment.
W. A. Bough.
Journal of Milk and Food Technology, Vol 36, No 7, p 371-374, July 1973. 1 fig, 3 tab, 12 ref.

Descriptors: *Effluents, *Flow rates, *Waste identification, Industrial wastes, Food processing industry, Chemical analysis, Sampling, Pollutant identification, Chemical oxygen demand, Biochemical oxygen demand, Acidity, Hydrogen ion concentration, Suspended solids, Waste water (Pollution), Dissolved solids, Fruit crops.
Identifiers: *Pimiento cannery, Characterization, Sample preparation, Composite samples, Volatile solids, Settleable solids, Fixed solids, Total solids.

Composite samples of liquid effluents taken at each unit operation in pimiento processing every 30 min over a 2-hr period were passed through a 20-mesh screen to remove particulate material and analyzed in duplicate for the following characteristics: total, fixed, volatile, suspended, dissolved, and settleable solids; pH; total acidity; COD; and 5-day BOD. Flow rates were determined with a trapezoidal weir which was placed in the rectangular gutters carrying the effluents. Characterization of the unit effluents revealed significant patterns of difference in composition and flow rates. The most concentrated effluent occurred in the first stage of the processing operation where the roasted peel was removed by washing. The suspended solids load of this effluent accounted for 69 percent of the total suspended solids load and 37 percent of the COD load, but only 18 percent of the total flow. Segregation and separate treatment of this concentrated effluent is suggested to reduce the total waste load. Another conentrated effluent resulted from the citric acid dip before the packing and closing area. The flow of the effluent was only 10 percent of the total, but accounted for 32 percent of the total dissolved solids and 37 percent of the total BOD. Two effluents from the grading area accounted for 50 percent of the total flow and only 10 percent of the total COD load. Recycling of these dilute effluents to the peel removal operation is suggested. Based on the rate of processing, the total wastes produced from pimiento canning contained 3.2, 60.2, and 35.4 lb. of suspended solids, COD, and BOD, respectively, per ton of raw pimientos. The total waste flow was 4,840 gal. per ton. (Holoman-Battelle)

Journal of Agricultural and Food Chemistry, Vol 21, No 5, p 822-824, September/October 1973. 2 fig, 2 tab, 6 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, *Organophosphorus pesticides, *Milk, *Poultry, *Cattle, *Pollutant identification, Pesticide residues, Insecticides, Acaricides, Miticides, Solvent extractions, Farm wastes, Methodology, Chemical analysis, *Gas chromatography.
Identifiers: Flame photometric gas chromatography, Animal tissues, Chlorfenvinphos, Chemical recovery, Sample preparation, Cleanup, Detection limits, Sensitivity, Gas liquid chromatography, Eggs, Bioaccumulation, Liver, Heart, Kidneys, Feces, Fat tissue, Muscle.

A reliable and sensitive gas liquid chromatographic method is described in which a flame photometric detector is used to determine micro amounts of chlorfenvinphos in the milk and body tissues of cattle and in the body tissues, eggs, and manure of chickens. With extraction and cleanup, 0.002 ppm of the insecticide could be detected in milk and 0.001 ppm in body tissues and eggs. Recoveries of ъ3-100 percent were obtained from the fat, muscle, kidney, liver, and heart of cattle and from the fat, muscle, liver, skin, and manure of chickens. Recoveries of 93 percent were obtained from milk and 81 percent was obtained from eggs. (Holoman-Battelle)

Identifiers: *High purity water, Flameless atomic absorption spectrophotometry, Multielemental analysis, Graphite tube, Precision, Signal integration, Absorbance, Reproducibility.

A polychromator has been used in conjunction with a multi-channel integration system and an automatic sample injection unit in graphite-tube flameless atomic-absorption spectroscopy. The precision of the system has been evaluated at high and low absorbances, and its ability to compensate for spurious absorption and variable volatility effects examined. The use of a non-resonance line correction system and integration of the absorption signal improves the precision of graphite-tube flameless atomic-absorption spectoscopy, particularly at low concentration levels. Some variations in signal intensity caused by changes in the volatility of the sample can be eliminated, and the compensation for spurious absorption phenomena is satisfactory up to 95 percent absorption, provided that the reference line is close to the resonance line of the main element. With the automatic sampler the system does represent a first approach to a fully automatic scheme for multi-element determinations by flameless atomic-absorption spectroscopy. The results achieved indicate the feasibility and the applicability of such a system, particularly when a limited number of elements have to be determined on a routine basis or

when the limited size and the nature of the sample (toxicity and activity) could make cumbersome or impossible the determination of more elements. (Holoman-Battelle)

THE DETERMINATION OF METHYL MERCURY IN URINE,
Environmental Protection Agency, Perrine, Fla. Perrine Primate Lab.
R. T. Ross, and J. G. Gonzalez.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 3, p 187-192, September 1973. 2 fig, 14 ref.

Descriptors: *Urine, *Methodology, *Pollutant identification, Chemical analysis, Solvent extractions.
Identifiers: *Electron capture gas chromatography, *Methylmercury, Sample preparation, Cleanup, Chemical recovery, Cysteine acetate, Acidification, Organic solvents, Organomercury compounds, Body fluids, Biological samples, Methylmercury chloride.

Described is a modification of the procedure for the determination of methyl mercury in urine employing a cysteine acetate cleanup procedure and analysis using the GLC-EC technique. A urine sample is pipetted into a stoppered centrifuge tube and acidified to pH 1 with concentrated HC1. Benzene is added to the mixture and shaken vigorously for 5 min. The emulsion was broken by centrifugation, and the organic layer removed by a disposable pipette. The urine is extracted again as described above. The organic layers were combined, and an aliquot was removed and extracted with cysteine acetate solution. The mixture was shaken vigorously, the layers separated, and an aliquot acidified to pH 1 with HC1 and extracted with two portions of benzene. The benzene layers were combined, dried over anhydrous sodium sulfate and stored in a glass stoppered test tube until GLC analysis. This method is capable of detecting ppb of methyl mercuric chloride (MMC) and combines high recoveries and rapid analysis time in a single procedure. Since binding of MMC to urine constitutents is fast and complete, acidification of the urine to pH 1-2 is absolutely necessary prior to benzene extraction. The cleanup procedure using cysteine acetate solution is also essential for the elimination of interfering GLC peaks. (Holoman-Battelle)

A MODIFIED EXTRACTION METHOD FOR DETERMINATION OF MINERAL OIL IN SEA WATER,
D. R. Hughes, R. S. Belcher, and E. J. O'Brien.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 3, p 170-171, September 1973. 1 tab, 1 ref.

Descriptors: *Water analysis, *Sea water, *Separation techniques, *Oil, Oily water, Solvent extractions, Oil pollution.
Identifiers: *Recovery, *Infrared absorption, Crude oil, Sample preparation, Efficiency, Mineral oil.

Synthetic seawater samples for evaluation of three oil-extraction procedures were prepared by adding sodium chloride to distilled water and spiking with 3.8 to 188 ppm Bass Strait Crude Oil. The three extraction techniques were (1) reciprocal shaking with carbon tetrachloride, (2) stirring with a stainless steel impeller with carbon tetrachloride, and (3) same procedure as (2) in an ultrasonic cleaning bath. Extractions were for 15 minutes, after which samples were allowed to stand overnight. Further separation was carried out in a separatory funnel. The third procedure required centrifuging to separate phases. Extracts were added to a Florisil column, eluted with carbon tetrachloride, and the summed infrared absorption determined for the eluate. Recoveries which were determined from calibration curves were best (mean value 102 percent) using the stirring-ultrasonic dispersion method. (Little-Battelle)

Descriptors: *Pollutant identification, *Polychlorinated biphenyls, *Chlorinated hydrocarbon pesticides, Chemical analysis, Pollutants, Organic compounds, Electrochemistry, DDE, Heptachlor, Dieldrin, Aldrin, Insecticides, Methodology, Equipment.
Identifiers: Fingerprinting, *Polychlorinated naphthalenes, Voltammetry, *Voltammetric detector, *Polychlorinated benzenes, Characterization, Chlorinated hydrocarbons, Isomers, Reduction potentials, Biphenyl, Voltammograms, 1 3 5 7-Tetrachloronaphthalene, Hexachlorobenzene, 2 4 5 2' 4' 5'-Hexachlorobiphenyl, Lindane, Chlordene, trans-Chlordane, 2-Chlorobiphenyl, 2 5-Dichlorobiphenyl, 2 6-Dichlorobiphenyl, 2 4 5-Trichlorobiphenyl, 3 4 5-Trichlorobiphenyl, 2 3 5 6-Tetrachlorobiphenyl.

The need for an analytical method which would provide for the exact identification or 'fingerprinting' of chlorinated hydrocarbons in the environment prompted the study of the possibility of using a voltammetric detector. This detector could provide both gross classification, such as distinguishing between polychlorinated biphenyls (PCB) and polychlorinated naphthalenes (PCN), and identification of the specific isomer in each class of compound. This research represents the first in the voltammetric reduction of PCB's and PCN's and provides a preliminary description of the analytical methodology applicable to the rapid identification of these compounds. The apparatus used employed three-electrode potentiostatic control circuitry with interruptable linear voltage sweep control. All solutions were 0.5 mM in the electroactive species with dimethyl sulfoxide as the solvent and 0.1 M tetraethylammonium bromide as the supporting electrolyte. Nitrogen gas was used for deaeration. The voltage values for the compounds analyzed are tabulated. (Holoman-Battelle)

INTERCALIBRATION OF ANALYSES OF RECENTLY BIOSYNTHESIZED HYDROCARBONS AND PETROLEUM HYDROCARBONS IN MARINE LIPIDS,
Woods Hole Oceanographic Institution, Mass.
J. W. Farrington, J. M. Teal, J. G. Quinn, T. Wade, and K. Burns.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 3, p 129-136, September 1973. 1 fig, 1 tab, 12 ref.

Descriptors: *Lipids, *Methodology, *Calibrations, Pollutant identification, Isolation, Organic compounds, Chemical analysis, Oil, Separation techniques, Solvent extractions, *Gas chromatography.
Identifiers: Natural organics, Marine environment, Interlaboratory studies, Flame ionization gas chromatography, *Petroleum hydrocarbons, Chemical composition, Chemical concentration, Column chromatography, Thin layer chromatography, Accuracy, Precision, Sample preparation, Biosynthesis, Petroleum products, Pristane, Squalene, Saponification, Petroleum distillates, Phytane, Phytadienes, n-Alkanes, South Louisiana crude oil.

An intercalibration exercise has been conducted to determine the accuracy and precision of hydrocarbon analyses. Column chromatography or thin layer chromatography was used to isolate the hydrocarbons from other lipids. Gas chromatography was then used as a screening method to select hydrocarbon extracts whih would be further analyzed by GC-mass spectrometry and other combinations of spectrophotometric and wet chemistry methods to determine the concentration of petroleum hydrocarbons in the samples. The presence or absence of the unresolved complex mixture signal in the hydrocarbon gas chromatograms served as the initial criterion for determining petroleum contamination. A homologous series of peaks in the chromatograms provided supplemental evidence of petroleum contamination which was then confirmed analytically. Three laboratories analyzed a reference sample (IDOE-5) consisting of cod liver lipids spiked with 371.8 ppm of a distillate cut (nC16 to nC28) of South Louisiana crude oil. The results were fairly accurate and agreed very well for the concentrations of both petroleum and recently biosynthesized pristane and squalene. Using GC as the initial screening method is fairly accurate and precise for hydrocarbons in the boiling range 287-450C with a polarity suitable for column or thin layer chromatographic isolations. The methods as employed here would not detect asphaltenes; O, N, S containing aliphatic and cyclic compounds; nor concentrations of hydrocarbons much above or below the boiling range specified above. W74-02390

THE DETERMINATION OF PENTACHLOROPHENOL AND HEXACHLOROPHENE IN HUMAN ADIPOSE TISSUE,
Environmental Protection Agency, Perrine, Fla. Perrine Primate Lab.
T. M. Shafik.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 1, p 57-63, July 1973. 2 fig, 1 tab, 15 ref.

Descriptors: *Chemical analysis, *Pollutant identification, *Mass spectrometry, Separation techniques, Solvent extractions, Phenolic pesticides, Chlorinated hydrocarbon pesticides, *Gas chromatography, Methodology, Antibiotics (Pesticides), Bactericides, Fungicides, Pollutants.
Identifiers: Electron capture gas chromatography, *Adipose tissue, Pentachlorophenol, *Trace levels, Quantitative analysis, *Hexachlorophene, Chemical recovery, Sample preparation, Animal tissue, Chlorinated hydrocarbons, Ethylation, Organic solvents.

A method was developed for determining low levels of pentachlorophenol (PCP) and hexachlorophene (HCP) in human adipose tissue. 200 mg of adipose tissue were accurately weighed into a Duall tissue grinder to which hexane was added. The sample was mixed on a Vortex mixer and allowed to stand for about 30 min. The sample was then ground, washed with hexane, and combined with 10 percent NaOH. This mixture was then mixed on the Vortex mixer for 1 min and centrifuged to separate the 2 layers. Several extractions with hexane and diethyl ether were carried with the final hexane extract containing ethylated PCP and HCP being transferred to a silica gel microcolumn for separation. Identification was made by electron capture gas chromatography. Confirmation of the diethyl ether of hexachlorophene and the ethyl ether of pentachlorophenol was accomplished by mass spectral direct probe analysis. The limits of detectability for PCP and HCP in adipose tissue are 5 and 10 ppb, respectively. Samples from the pooled human fat weighing 100-300 mg were analyzed for both

PCP and HCP using the procedure described in the analysis of adipose tissue. An average of 5 ppb PCP was found in six replicates and 30 ppb HCP in 10 replicates of human adipose tissue. Replicate samples of the pooled fat (100-300 mg) were spiked with 4.6 ng PCP and 10 ng HCP. The average recoveries of PCP and HCP from the replicates analyzed were 75 percent and 96 percent, respectively. (Holoman-Battelle)

POLYCHLORINATED TERPHENYLS IN PAPERBOARD SAMPLES,
Ontario Research Foundation, Sheridan Park. Pesticide and Trace Analytical Lab.
G. H. Thomas, and L. M. Reynolds.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 1, p 37-41, July 1973. 2 fig, 10 ref.

Descriptors: *Chemical analysis, *Pollutant identification, *Polychlorinated biphenyls, *Gas chromatography, Methodology, Estimating, Organic compounds, Pollutants, Foods, Aroclors.
Identifiers: *Polychlorinated terphenyls, *Paperboard, Packaging materials, Sample preparation, Aroclor 5460, Electron capture gas chromatography.

The detection, estimation, and confirmation of the identity of polychloroterphenyls (PCTs) as well as polychlorobiphenyls (PCBs) are described for paperboard and food packaging material. The sample is blended, and an aliquot Soxhlet extracted, concentrated, cleaned-up on Florisil, and subjected to a 'PCB split' on Florisil. For waxy samples, the residue from extraction is dissolved in 5 percent benzene in acetone with slight warming; the solution chilled in a dry ice/methanol bath for 3 min; the flocculent precipitate filtered; and the filtrate concentrated and treated as above. The PCT content of cleaned-up sample extracts is screened and quantified using gas chromatography. Approximately 100 paperboard samples have been analyzed with PCT levels of 0-163 ppm and PCB levels of 0-20 ppm. Two satisfactory gas chromatography systems have been developed for the estimation of PCTs. (Holoman-Battelle)

THE USE AND EFFECT OF MIXED STANDARDS ON THE QUANTITATION OF POLYCHLORINATED BIPHENYLS,
National Marine Fisheries Service, Seattle, Wash. Pacific Fishery Products Technology Center.
F. L. Beezhold, and V. F. Stout.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 1, p 10-15, July 1973. 2 fig, 1 tab, 12 ref.

Descriptors: *Polychlorinated biphenyls, *Pollutant identification, *Separation techniques, Aroclors, Chemical analysis, Fish, Gas chromatography, Channel catfish.
Identifiers: *Quantitative analysis, *Mixed standards, Animal tissues, Mixtures, Menhanden, Brevoortia tyrannus, Ictalurus punctatus, Carcharhinus falciformis, Aroclor 1254, Aroclor 1260, Liver, Fish meal.

A study was made of the problems encountered when the chromatogram of a sample being analyzed for PCB's via GLC cannot readily be compared to a particular Aroclor standard. The use of mixed Aroclor standards was proposed and a study made of the effect of mixed standards on the analytical results. It was found that the choice of a standard could alter the values by more than a factor of 2. In addition, the particular mixture used as a standard should be reported along with resulting values. (Holoman-Battelle)

APPLICATIONS, INVOLVING THE IODIDE ION. VIII. DIRECT AND INDIRECT DETERMINATION OF MERCURY (I) AND ANALYSIS OF MIXTURES. ANALYSIS OF CHROMIUM (VI)-CHROMIUM (III) MIXTURES. DETERMINATION OF HYPOCHLORITE,
Cairo Univ., Giza (Egypt). Faculty of Science.
H. Khalifa, and Y. M. Issa.
Microchemical Journal, Vol 18, No 4, p 436-444, August 1973. 8 tab, 11 ref.

Descriptors: *Mercury, *Volumetric analysis, *Chromium, *Methodology, Iodides, Heavy metals, Aqueous solutions, Chemical analysis, Pollutant identification.
Identifiers: *Potentiometric titration, *Hypochlorites, Mixtures, Accuracy, Precision, Detection limits.

Mercury (I), down to 3 ppm, has been accurately determined by direct titration with iodide or by back-titrating excess of iodide with mercury (II) using silver amalgam as the indicator electrode. The direct method and additional volumetric ones were applied to the rapid analysis of various mixtures involving mercury (I) with fair accuracy and precision. Analysis of Cr (VI)-Cr (III) mixtures involved potentiometric back-titration of excess iodide and of excess EDTA separately with mercury (II). Back-titration of excess iodide was successfully applied to the determination of hypochlorite. (Holoman-Battelle)

MICRODETERMINATION OF ARSENIC (III) AND OSMIUM (VIII) THROUGH OSMIUM--THIOUREA REACTION,
Andhra Univ., Waltair (India). Dept. of Chemistry.
P. P. Naidu, and G. G. Rao.
Microchemical Journal, Vol 18, No 4, p 422-427, August 1973. 1 fig, 3 tab, 3 ref.

Descriptors: *Chemical analysis, *Aqueous solutions, *Pollutant identification, *Chemical reactions, Color reactions, Spectrophotometry, Cations, Anions, Alkali metals, Alkaline earth metals, Heavy metals, Catalysts, Halogens, Methodology.
Identifiers: *Arsenic, *Osmium, Trace levels, Quantitative analysis, Ionic interference, Accuracy, Chemical interference, Osmium-thiourea reaction, Complexation, Thiourea.

The osmium-thiourea reaction described in previous methods for the determination of osmium and arsenic was slow under the conditions utilized. A new method has been proposed for the rapid determination of osmium without waiting 30 minutes for the attainment of full color intensity. With this procedure only 1 ml of 1 percent thiourea is necessary. Arsenic (III) catalyzed the reaction. Qualitative and quantitative methods are described for the determination of both osmium and arsenic. Interference study of 30 ions showed they do not interfere. (Holoman-Battelle)

A HIGH-SPEED LIQUID CHROMATOGRAPH WITH A FLOW-SPECTROFLUORIMETRIC DETECTOR AND THE ULTRAMICRO-DETERMINATION OF AROMATIC COMPOUNDS,
Kyoto Univ. (Japan). Dept. of Chemistry.
H. Hatano, Y. Yamamoto, M. Saito, E. Mochida, and S. Watanabe.
Journal of Chromatography, Vol 83, p 373-380, August 29, 1973. 6 fig, 1 tab, 10 ref.

Descriptors: *Instrumentation, *Chemical analysis, *Aromatic compounds, *Pollutant identification, *Organic compounds, Laboratory equipment, Separation techniques, Vitamins, Fluorescence, Methodology, Research equipment.
Identifiers: High speed liquid chromatography, Flow spectrofluorimetric detector, Quantitative analysis, Spectrofluorimetry, Trace levels, Sensitivity, Aromatic hydrocarbons, Vitamin B2, Vitamin B3, Vitamin B6, Naphthalene, Anthracene, Pyrene, Emission spectra, Benz (a)anthracene, Benz (a)pyrene, Benz (e)pyrene, Excitation spectra.

A high-speed liquid chromatograph has been used with a new spectrofluorimetric detector, which is more sensitive than a normal ultraviolet absorption or spectrophotometric detector for fluorescent compounds. The spectrofluorimeter is equipped with double-beam optics and with a flow-cell, 3 microliters in volume, and is used to record the emission and excitation spectra of the separated components during the chromatographic separation by stopping the elution at peak maxima. This technique enables both qualitative identification and quantitative determination of the separated components. Selective recording of chromatograms is possible by varying the wavelengths for emission and excitation. Mixtures of vitamins B2, B3, and B6, and of naphthalene, anthracene, pyrene, benz (a)anthracene, benz (a)pyrene and benz (e)pyrene have been separated and identified. (Holoman-Battelle)

ION-EXCHANGE SEPARATIONS ON MIXED COLUMNS,
Tokyo Univ. (Japan). Inst. of Industrial Science.
T. Yamabe.
Journal of Chromatography, Vol 83, p 59-65, August 29, 1973. 4 fig, 4 ref.

Descriptors: *Separation techniques, *Cations, Heavy metals, Anion exchange, Cation exchange, Hydrogen ion concentration, Ion exchange, Organic acids, Copper, Zinc, Lead, Cobalt, Cadmium.
Identifiers: Mixed columns, *Ion exchange chromatography, Ion exchange resins, *Elution, *Organic hydroxy acids, Rare earth elements, Lactic acid, Tartaric acid, Chelating agents, Terbium, Lutetium, Thulium, Erbium, Holmium, Dysprosium, Gadolinium, Eluents, Retention time, Europium, Samarium, Neodymium, Praseodymium, Cerium, Chemical concentration.

The separation of metal ions by elution with a solution containing a chelate-forming agent, namely an organic hydroxy acid (lactic acid or tartaric acid) was investigated by changing the mixing ratio (gamma) of the cation- and anion-exchange resins and by changing the pH of the eluent. When the concentration of lactic acid was 0.5 M at pH 2.8 and gamma equals 1/2, a mixed sample of Lu, Tm, Er, Ho, Dy, Tb and Gd was completely separated within 100 min. When the concentration of tartaric acid was 0.25 M at pH 3.0 and gamma equals 2, a mixed sample of Cu, Zn, Pb, Co and Cd was completely separated within 90 min. (Holoman-Battelle)

DETERMINATION OF ZINC BY FLAMELESS ATOMIC ABSORPTION SPECTROPHOTOMETRY,
Ohio State Univ., Columbus. Coll. of Medicine.
D. Kurz, J. Roach, and E. J. Eyring.
Analytical Biochemistry, Vol 53, No 2, p 586-593, June 1973. 2 tab, 40 ref.

Descriptors: *Zinc, *Aqueous solutions, *Chemical analysis, Urine, Instrumentation, Pollutant identification, Anions, Cations, Heavy metals, Methodology, Calcium, Iron, Copper, Potassium, Sodium, Nitrates, Sulfates, Iodides, Chlorides.
Identifiers: *Biological samples, *Flameless atomic absorption spectrophotometry, Serum, Ionic interference, Chemical recovery, Sample preparation, Body fluids, Chemical interference, Lithium, Acetates.

The flameless atomic absorption method described is a simple, rapid, accurate

microtechnique for determining zinc in aqueous solutions, serum, or urine. It requires no sample pretreatment, only 1.0 microliter of sample per determination, no correction for viscosity differences between sample and standard solutions, and is not subject to ionic or organic interference. The average recovery of added zinc in serum is 97.5 percent and in urine is 97.6 percent. The values obtained for serum (mean plus or minus SD: 94.6 plus or minus 11.0 micrograms/100 ml; N equals 25) and urine (range: 600-1000 micrograms/24 hr; N equals 4) are comparable to the values reported in the literature. The coefficient of variation was less than 5.0 percent in all cases. The qualitative concentration limit was 0.009 microgram/100 ml. The techniques and instrumentation described are also applicable to a number of trace minerals of common interest. (Holoman-Battelle)

ATOMIC ABSORPTION AND FLUORESCENCE SPECTROMETRY WITH A CARBON FILAMENT ATOM RESERVOIR. PART XIV. THE DETERMINATION OF VANADIUM IN FUEL OILS,
Imperial Coll. of Science and Technology, London (England). Dept. of Chemistry.
G. L. Everett, T. S. West, and R. W. Williams.
Analytica Chimica Acta, Vol 66, No 2, p 301-303, September 1973. 1 tab, 3 ref.

Descriptors: *Chemical analysis, *Pollutant identification, Instrumentation, Solvent extractions, Heavy metals, Methodology, Separation techniques, Pollutants, Oil, *Spectrophotometry.
Identifiers: Petroleum products, *Fuel oil, Atomic absorption spectrophotometry, Fluorescence spectrophotometry, Carbon filament atom reservoir, *Vanadium, Reproducibility, Precision, Detection limits, Sensitivity, Acid stripping, Extraction efficiency, Sample preparation, Organic solvents, 1- (2-Pyridyl-azo-2-naphthol), Inorganic acids, Hydrochloric acid.

The carbon filament atom reservoir technique for determining vanadium in aqueous media and Cu, Ag, and Ni in lubricating oils has been extended to include vanadium in petroleum products. A 10-ml sample solution was shaken with 2 M HCl for 5 min and separated. 0.1 percent 1- (2-pyridyl-azo-2-naphthol) (PAN) in ethanol was added to the acid layer and the pH adjusted to 4.0 with concentrated ammonia. The vanadium-PAN complex was then extracted with chloroform and analyzed. This method has an overall extraction efficiency of greater than 95 percent; the detection limit of V in the original sample is 0.007 ppm (w/w). The sensitivity of the method (1 percent abs.) was 0.013 pg and the detection limit (S:N equals 2) was 0.03 pg; the reproducibility for 15 replicates at the 10-ng level was plus or minus 4 percent. ISOLATION AND CLEANUP OF ORGANOPHOSPHORUS INSECTICIDES AND THEIR OXONES FROM ANIMAL TISSUES,
Institute of Industrial Hygiene and Occupational Diseases, Bratislava (Czechoslovakia).
A. Hladka, and J. Kovac.
Zeitschrift fur Analytische Chemie, Vol 265, No 5, p 339-342, July 30, 1973. 3 fig, 1 tab, 10 ref.

Descriptors: *Isolation, *Pollutant identification, *Radiochemical analysis, *Phosphothioate pesticides, *Pesticide residues, Solvent extractions, Organophosphorus pesticides, Insecticides, Radioactivity techniques, Chemical analysis, Selectivity.
Identifiers: *Oxones, Animal tissues, Radiochromatography, Isomers, Chemical recovery, Precision, Sample preparation, Metabolites, Cleanup, Malathion, Blood, Muscle, Liver, Parathion, Malaoxone, Paraoxone, Fenitrothion, Fenitrooxone, Paper chromatography, Sensitivity, Rats.

A simple isolation and cleanup procedure has been developed for the determination of organophosphorus insecticides and their oxones in animal tissues. This procedure partly unites extraction of organophosphorus pesticides and their oxones with cleanup by column chromatography. Most polar coextracts remain on the column and in its further processing the eluate does not tend to form emulsion. The process has been studied on model mixtures of P-32- and C-14-labelled pesticides with tissues as well as after application of pesticides to white rats. The average recovery of the method is 90.5 percent, with a standard deviation of plus or minus 5.1 percent. (Holoman-Battelle)

SELECTION OF EXPERIMENTAL CONDITIONS FOR THE PHOTOMETRIC COMPLEX FORMATION TITRATIONS OF METALS IN THE PPM-RANGE,
Amsterdam Univ. (Netherlands). Physics Lab.
J. Kragten.
Zeitschrift fur Analytische Chemie, Vol 264, No 5, p 356-361, June 13, 1973. 8 fig, 13 ref.

Descriptors: *Metals, *Pollutant identification, Volumetric analysis, Chemical analysis, Zinc, Color reactions, Photometry, Selectivity.
Identifiers: Complexometric titration, *Chemical indicators, *Metal complexes, Travel levels, Chromogenic reagents, Bismuth, Absorbance, EDTA, Xylenol Orange, Thorium, Precision, Data interpretation, Semi Xylenol Orange, Complexation, PAR, TAR.

Metals can be complexometrically titrated in the ppm-range in the presence of equivalent amounts of indicator. When (2:2) metal-indicator complexes predominate in solution, the end-points found from the 'L'-shaped absorbance-volume curves by extrapolation, are generally systematically shifted. This can be avoided by a proper choice of the indicator. Mathematical conditions previously derived are transformed to practical titration conditions, which, applied to diagrams for Bi and Zn, lead to the selection of optimum experimental conditions for these metals. The procedure is generally applicable and remains suitable even when a lack of data requires some preliminary investigations. (Holoman-Battelle)

AMPEROMETRIC TITRATION OF MERCURY (II) WITH EDTA, DTPA AND TRIEN IN THE PPM-RANGE,
Laboratorium voor Analytische Scheikunke, Amsterdam (Netherlands).
W. E. van der Linden, and J. Dieker.
Zeitschrift fur Analytische Chemie, Vol 264, No 5, p 353-355, June 13, 1973. 2 fig, 1 tab, 2 ref.

Descriptors: *Volumetric analysis, *Mercury, Electrochemistry, Heavy metals, Trace elements, Chemical analysis, Hydrogen ion concentration, Iron, Copper, Pollutant identification.
Identifiers: *Amperometric titration, *EDTA, *DTPA, *TRIEN, *Metal complexes, Trace levels, Rotating gold electrodes, Chemical interference, Precision, Bismuth, Thorium, Rotating mercury film electrodes, Rotating platinum electrodes, Metal-DTPA complexes, Metal-EDTA complexes, Metal-TRIEN complexes, Stability constants.

Mercury (II) can be titrated at pH 2.5-3 with EDTA, DTPA and TRIEN. The titration is followed amperometrically making use of a rotating gold-electrode at a potential of plus 0.25 V vs. S.C.E. Especially the use of DTPA allows the determination of small amounts of mercury (II (down to 1 microgram). The standard deviation is 2-3 percent. A correction for the systematic negative error of approximately 4 percent in the case of EDTA and 8 percent in the case of DTPA, mainly caused by the faradaic reaction at the electrode, can easily be made. Bismuth, iron and thorium will interfere, but on addition of fluoride the interference of thorium and iron can be masked. TRIEN showing a better selectivity of mercury towards iron has the lowest conditional stability constant and will not be suited to the titration of very low concentrations. Copper may be present in a thousand fold concentration. About equivalent amounts of iron (III) can be titrated in one run with mercury. In that case two end-points are obtained, the first one for iron, the second one for mercury. The ratio of the conditional constants of mercury to those for copper and iron is more favorable for DTPA and especially TRIEN. (Holoman-Battelle)

ANALYSIS OF ALKYL ETHOXYLATES BY NMR,
Canada Packers Ltd., Toronto (Ontario). Research and Development Labs.
C. K. Cross, and A. C. MacKay.
Journal of the American Oil Chemists' Society, Vol 50, No 7, p 249-250, July 1973. 1 fig, 1 tab, 5 ref.

Descriptors: *Nuclear magnetic resonance, Surfactants, *Pollutant identification.
Identifiers: *Alkyl ethoxylates, Characterization, Nonionic surfactants, Sample preparation, Polymerization, Ethoxylates.

A new, fast, simple technique is presented, which allows complete characterization of alkyl ethoxylates in terms of average chain length of the alkyl portion and degree of polymerization. The method uses trimethylsilylation of the terminal-OH of alkyl ethoxylate to obtain a sharp distinct internal standard of nine hydrogens per molecule. The number of hydrogens responsible for the NMR at 0.7-1.5 and 3.0-3.9 ppm can be calculated and, consequently, the average chain length and average number of ethylene oxide units. Water and ethanol do not interfere since they are removed in the reaction. Results for several commercial alkyl ethoxylates were in good agreement with compositions stated by the manufacturers. (Little-Battelle)

IRON, ZINC, MAGNESIUM, AND COPPER CONCENTRATIONS IN BODY MEAT OF THE BLUE CRAB, CALLINECTES SAPIDUS,
Maryland Univ., Solomons. Natural Resources Inst.
D. D. Boon.
Chesapeake Science, Vol 14, No 2, p 143-144, June 1973. 1 tab, 2 ref.

Descriptors: *Copper, *Iron, *Zinc, *Magnesium, Heavy metals, Foods, *Crabs.

Identifiers: *Blue crab, Sample preparation, Atomic absorption spectrophotometry, Macroinvertebrates, Biological samples, Bioaccumulation, Callinectes sapidus, Animal tissues.

Body meat of the blue crab, Callinectes sapidus, was analyzed by atomic absorption for iron, zinc, magnesium, and copper. Samples were taken biweekly from May 6, 1971 to April 19, 1972, a total of twenty-six determinations over a one-year period. For each determination, a one pound can of unpasteurized 'regular' or 'special' crab body meat was purchased locally. One hundred grams of this meat were homogenized with 100 g of distilled water in a high speed blender and acid digested. Concentrations found were as follows: iron, 7-66 ppm; zinc, 36-68 ppm; magnesium, 384-527 ppm; and copper, 5-97 ppm. Concentrations of copper were high during May, 1971, but no seasonal trend was found. Iron and copper values were near those found by other investigators in 1939; magnesium contents were higher. ADSORPTION CHARACTERISTICS OF SILBER, LEAD, CADMIUM, ZINC, AND NICKEL ON BOROSILICATE GLASS, POLYETHYLENE, AND POLYPROPYLENE CONTAINER SURFACES,
Chadron State Coll., Neb.
A. W. Struempler.
Analytical Chemistry, Vol 45, No 13, p 2251-2254, November 1973. 5 fig, 1 tab, 8 ref.

Descriptors: *Adsorption, *Aqueous solutions, *Heavy metals, *Ions, *Plastics, Physical properties, Lead, Cadmium, Zinc, Nickel, Chemical analysis, Hydrogen ion concentration, Temperature, Lighe, Methodology, Sampling, Stability, Precipitation (Atmospheric).
Identifiers: Borosilicate glass, Polypropylene, Storage containers, *Chemical loss, Silver, Flameless atomic absorption spectrophotometry, Acidification, Trace levels.

Container absorption of low concentrations of Ag, Pb, Cd, Zn, and Ni ions in aqueous solutions was studied using flameless atomic absorption spectrometry in order to develop a workable method for studying trace quantities of these ions in natural precipitation (rain, snow, hail). Only new containers (Borosilicate glass, polyethylene, polypropylene) were used after rigorous cleaning. Fifty milliliters of test solution were stored in each container during the aging period and analyzed initially at daily intervals. After several days analyses were made at 2- to 3-day intervals, or longer. The adsorption of Ag ion on borosilicate glass and polypropylene containers was studied as related to light and temperature. No single container type proved satisfactory for all ions. Polyethylene containers did not absorb cadmium or zinc. Acidification to pH 2 with HNO3 prevented silver, lead, cadmium, and zinc absorption on borosilicate glass surfaces. Acidification also prevented absorption of silver on polyethylene surfaces. Additionally, silver solutions must be maintained in the dark, even under acidified conditions, to maintain stability and minimize adsorption loss. New polypropylene containers could not be cleaned satisfactorily for cadmium and zinc studies. Extreme care was necessary to minimize contamination when working with the low ion concentrations detectable by flameless atomic absorption spectrometry. (Holoman-Battelle)

Descriptors: *Chlorinated hydrocarbon pesticides, *Selectivity, *Separation techniques, *Gas chromatography, Polychlorinated biphenyls, Pollutant identification, Heptachlor, Temperature, Dieldrin, DDT, Aldrin, Endrin.
Identifiers: *Sensitivity, *Electrolytic conductivity detector, Detection limits, Gas flow rates, Furnace temperature, Chemical composition, Reaction gas, Aroclor 1254, Electrolytic conductivity gas chromatography, Heptachlor epoxide, alpha-Chlordane, o p'-DDT, Thermal degradation, Solvent systems, Ethanol, Dimethylsulfoxide, Formamide, gamma-Chlordane, Lindane, Pentachloronitrobenzene, p p' -DDT, p p' -DDE, Methoxychlor, Chlorobenzene, 1 2-Dichlorobenzene, 1 3-Dichlorobenzene, 1 4-Dichlorobenzene, 1 2 3-Trichlorobenzene.

Factors which influence the sensitivity and selectivity of the Coulson electrolytic conductivity detector to chlorinated hydrocarbon pesticides were determined and optimized. The most influential factors which affect sensitivity are absorptive surfaces, electrode polarization, system stability, and furnace temperature. Replacement of the standard 4-mm i.d. quartz reaction tube with one of 0.5-mm i.d., replacement of the silicone rubber septum at the furnace exit with a teflon fitting, and increasing the maximum cell voltage to 44 V dc resulted in a minimum detectability of 0.1 ng for heptachlor and a useable sensitivity of 0.4 ng as compared to 2 ng and 5 ng, respectively, for the unmodified detector. The most influential factors which affect selectivity are funace temperature, reaction gas composition, and reaction gas flow rate. Optimization of these parameters enables most chlorinated hydrocarbon pesticides to be selectively determined in the presence of other halogenated materials such as PCB with selectivities greater than 1000:1. THE DETERMINATION OF PHENOLS IN AQUEOUS EFFLUENTS,
British Coke Research Association, Chesterfield (England).
R. L. Cooper, and K. C. Wheatstone.
Water Research, Vol 7, No 9, p 1375-1384, September 1973. 5 fig, 5 tab, 20 ref.

Descriptors: *Phenols, Effluents, *Separation techniques, *Pollutant identification, *Industrial wastes, *Liquid wastes, Chemical analysis, Drainage water, Organic compounds, Waste water (Pollution), Solvent extractions, Methodology, Colorimetry, Water analysis, *Gas chromatography.
Identifiers: Flame ionization gas chromatography, Cresol, Xylenols, Dihydric phenols, Ethylphenols, Monohydric phenols, Detection limits, Organic solvents, Methyl isobutyl ketone, Gas liquid chromatography, Coke oven effluents, Trimethylsilyl ethers, o-Cresol, m-Cresol, p-Cresol, o-Ethylphenol, 2 5-Xylenol, m-Ethylphenol, 2 4-Xylenol, 3 5-Xylenol, p-Ethylphenol, 2 6-Xylenol, 2 3-Xylenol, 3 4-Xylenol, Catechol, 2 3 5-Trimethylphenol, 2 4 5-Trimethylphenol, 2 4 6-Trimethylphenol, 4-Methylcatechol, 2 3 6-Trimethylphenol.

A method is described for the determination of monohydric and dihydric phenols in aqueous effluents. The phenols were extracted into methyl isobutyl ketone, the trimethylsilyl ethers prepared, separated by gas-liquid chromatography and detected by a flame ionization detector. Complete separation of phenol, cresols, xylenols, ethylphenols and dihydric phenols was achieved using dual stainless steel columns packed with Chromosorb W (AW-DCMS) coated with 5 percent tri-2,4-xylenyl phosphate and by linear temperature programming from 75 C to 125 C at 1.5 C/min; concentrations down to 0.1 mg/l of each phenol in the original sample could be determined. The results obtained by the gas chromatographic method were compared with those using standard colorimetric methods of analysis for carbonization effluents arising from different sources. The method is generally applicable to wastes containing phenols. (Holoman-Battelle)

ORGANIC DESORPTION FROM CARBON-II. THE EFFECT OF SOLVENT IN THE DESORPTION OF PHENOL FROM WET CARBON,
Missouri Univ., Rolla. Graduate Center for Materials Research.
R. H. Pahl, K. G. Mayhan, and G. L. Bertrand.
Water Research, Vol 7, No 9, p 1309-1322, September 1973. 7 fig, 3 tab, 11 ref.

Descriptors: *Phenols, *Activated carbon, Methodology, *Separation techniques, *Aqueous solutions, Adsorption, Solvent extractions, Moisture content, Pollutant identification, Sorption, Water, Freeze drying, Spectrophotometry, Physical properties, Thermodynamics, Organic compounds, Pollutants.
Identifiers: *Desorption, *Organic solvents, Pollutant removal, Wet carbon, *Inorganic solvents, Heat of solution, Benzene, Cyclohexane, Acetonitrile, Dodecyl alchol, Methyl alcohol, Diozane, Cellosolve acetate, Tetrahydrofuran, Dimethylformamide, Molar absorptivity, Thermogravimetric analysis, Continuous flow system, Soxhlet extraction, Ultraviolet spectrophotometry, Calorimetry, Heat of formation.

The desorption of phenol from active carbon was studied using cyclic and continuous flow desorbers. The absorptivity index of phenol in each of 10 solvents was determined by spectrophotometry using a set of standard solutions of phenol in each solvent. Phenol was adsorbed onto the carbon in a polyethylene container; and the carbon was separated from solution by filtration. The damp carbon was placed in flasks, frozen, and vacuum-dried. After 36-48 h the flasks were removed,

weighted, and the 'dry' carbon stored. Final drying was done by freeze drying and confirmed by thermogravimetric analysis. A Soxhlet extraction apparatus was used to desorb phenol from carbon using methanol, acetonitrile and cyclohexane. A continuous flow desorber constructed from a modified Soxhlet extractor was used so that all the solvents could be used under identical flow and temperature conditions. The heat of solution of phenol in methanol, dodecyl alcohol, acetonitrile and cellosolve acetate was determined using the calorimeter and experimental procedure described by Betrand, Beaty and Burns (1968). A wide difference in desorption capabilities was shown among the 10 solvents. The system employed was complex, with water being present in addition to phenol in the carbon. An attempt to correlate the desorption data with the physical properties of the phenol and solvent and regular solution theory is made. A thermodynamic approach using the linear free energy-enthalpy relationship produced a reasonable correlation of the heat of formation of the phenol-solvent hydrogen bond with the desorption data. This indicated that the desorption of the phenol from carbon in this complex system is dependent upon the ability of the solvent to form hydrogen bonds with the phenol. (See also W74-02419) (Holoman-Battelle)

ORGANIC DESORPTION FROM CARBON-II. THE EFFECT OF SOLVENT IN THE DESORPTION OF PHENOL FROM DRY CARBON,
Missouri Univ., Rolla. Graduate Center for Materials Research.
W. W. Knickmeyer, K. G. Mayhan, and G. L. Bertrand.
Water Research, Vol 7, No 9, p 1323-1330, September 1973. 2 fig, 7 tab, 2 ref.

Descriptors: *Activated carbon, *Adsorption, Methodology, *Phenols, *Separation techniques, Pollutant identification, Sorption, Thermodynamics, Solvent extractions, Water, Organic compounds, Pollutants, Physical properties.
Identifiers: *Desorption, Pollutant removal, Continuous flow system, *Dry carbon, Heat of solution, Heat of formation, Heat of wetting, Organic solvents, Molar absorptivity, Ultraviolet spectrophotometry, Dimethylformamide, 1 4-Dioxane, Acetonitrile, Tetrahydrofuran, Cyclohexane, Cellosolve acetate, Methyl alcohol, Benzene, Chloroform, Dodecane, Inorganic solvents, n-Pentane.

The desorption of phenol from active carbon was studied using a continuous flow desorber. The system used was nearly water free to reduce water-phenol interactions. An attempt to correlate the desorption data with the physical properties of phenol and solvents, in addition to regular solution theory, proved unsuccessful. A thermodynamic approach using the linear free energy-enthalpy relationship produced a general trend by using the heat of solution for phenol in solution and a reasonable correlation using the heat of formation of the phenol-solvent hydrogen bond with the desorption data. AN AUTOMATED ANALYSIS FOR UREA IN SEAWATER,
Oregon State Univ., Corvallis. School of Oceanography.
J. M. DeManche, H. Curl, Jr., and D. D. Coughenower.
Limnology and Oceanography, Vol 18, No 4, p 686-689, July 1973. 1 fig, 6 ref.

Descriptors: *Ureas, *Automatic control, Methodology, *Seawater, *Pollutant identification, Water analysis, Chemical analysis, Nitrogen compounds, Organic compounds, Saline water.
Identifiers: Technicon Autoanalyzer, Sensitivity, Detection limits, Precsion.

An automated method adapted to a Technicon Auto Analyzer has been used to determine urea in seawater. In the flow system for automated analyses, a sample rate of 12/hr with a sampling time of 4.5 min and a 0.5 min wash gave good results. The sensitivity of the method with the 50-mm flow cell used was 0.018 absorbance units/(microgram-atoms urea-N)/liter. Ten replicate samples of 1.0 and 3.0 microgram-atoms urea-N/liter had standard deviations of 0.019 and 0.017 and a lower limit of detection less than 0.1 microgram-atom. For most precise measurements at low levels, the limit of detection is less than 0.05 microgram-atom urea-N/liter. Beer's law was found to apply over the range of 0-10 microgram-atoms urea-N/liter. The method was used to measure urea in seawater samples collected on cruise C72091 of the RV Cayuse to the Inside Passage of Southeast Alaska in October 1972. The lowest value was 0.25 microgram-atom urea-N/liter and the highest 2.20. The median value for 308 samples taken at depths from 1 to 200 m was 0.59. The automated method is rapid and sensitive enough to measure in situ urea concentrations before enrichment with N-labeled urea in nitrogen uptake experiments, eliminating the problems reported by McCarthy (1972). MERCURY IN FISH, SEDIMENTS, AND WATER IN LAKE OAHE, SOUTH DAKOTA,
Environmental Protection Agency, Kansas City, Mo. Region VII.
C. M. Walter, F. C. June, and H. G. Brown.
Journal Water Pollution Control Federation, Vol 45, No 10, p 2203-2210, October 1973. 1 fig, 3 tab, 10 ref.

Descriptors: *Mercury, Freshwater fish, *Lake sediments, Water analysis, *Pollutant identification, Chemical analysis, Heavy metals, Methodology, Water sampling, Bottom sampling, Tailwater, Walleye, Sauger, White bass, Yello perch, Channel catfish, Carp, Soil analysis, Aquatic soils, *Spectrophotometry, *South Dakota.
Identifiers: Flameless atomic absorption spectrophotometry, *Lake Oahe (So. Dak), Lake Sharpe (So. Dak.), Sample preparation, Chemical recovery, Cheyenne River, Animal tissues, Background levels, Northern pike, Esox lucius, Stizostedion vitreum vitreum, Sauger, Stizostedion canadense, Morone chrysops, Perca flavescens, White crappie, Pomoxis annularis, Black crappie, Pomoxis nigromaculatus, Foster Bay, Fishgut Creek, Oak Creek, Agency Creek, Whitlocks Bay, Blue Blanket Creek, Grand River, Spring Creek, Ruby Creek.

Analyses for total mercury content were made of fish, sediment, and water samples collected in several locations in Lake Oahe, South Dakota, and its tailwaters. Preparation of fish samples for Gh analysis consisted of thawing frozen specimens, removal of a portion of the flesh, and rigorous chemical digestion. The concentration of total Hg in the sample was determined by the Hatch and Ott flameless atomic absorption method using a Hg analyzer coupled to stripchart recorder. A total of 43 sediment samples was collected, placed in polyethylene bags and frozen. Subsamples were digested, diluted to a 500-ml volume, and analyzed for Hg content as above. Water samples were also analyzed as above. Mercury concentrations equal to or exceeding 0.5 mg/kg occurred in 30 of 225 fish samples tested (13 percent). Higher concentrations were found most frequently in predatory game fishes, primarily northern pike and walleye, from the Cheyenne River arm. Sediment samples with mercury concentrations above 0.5 mg/kg were found only in the Cheyenne River arm, but water samples contained only neglibible amounts of mercury. Recommendations for further studies are presented. (Holoman-Battelle)

SALINITY CORRECTIONS FOR DISSOLVED OXYGEN MEASUREMENTS,
National Oceanographic Instrumentation Center, Washington, D.C.
B. S. Pijanowski.
Environmental Science and Technology, Vol 7, No 10, p 957-958, October 1973. 4 fig, 1 ref.

Descriptors: *Salinity, *Dissolved oxygen, *Measurement, *Water temperature, Methodology, Pollutant identification, Compensation.
Identifiers: Correction factors.

Presented is a convenient method of compensating for the effects of salinity on the data acquired from dissolved oxygen meters. The basic design of most of these instruments does not include provision for salinity compensation or, at best, uses a fixed value. The need for a general method of compensation is emphasized, particularly when such meters are to be used in estuarine studies. The correction technique is based on earlier work by Gilbert et al. and is presented in a form suitable for development by computer for specific instruments. Illustrations demonstrating the methodology include curves for a meter intended basically for use in freshwater as well as for another which employs a fixed value of salinity compensation. The correction factors are dimensionless and can be applied to correct dissolved oxygen values in units of either ppm or ml/1. (Holoman-Battelle)

OCCURRENCE OF HEXACHLOROPHENE AND PENTACHLOROPHENOL IN SEWAGE AND WATER,
Oregon State Univ., Corvallis. Dept. of Agricultural Chemistry.
D. R. Buhler, M. E. Rasmusson, and H. S. Nakaue.
Environmental Science and Technology, Vol 7, No 10, p 929-934, October 1973. 4 fig, 5 tab, 8 ref.

Descriptors: *Water analysis, *Gas chromatography, *Mass spectrometry, *Pollutant identification, *Sewage, Chemical analysis, Phenolic pesticides, Chlorinated hydrocarbon pesticides, Water sampling, Sewage effluents, Water pollution, Waste water (Pollution), Fungicides, Antibiotics (Pesticides), Sewage treatment, Radioactivity techniques, Efficiencies, Bactericides.
Identifiers: *Hexachlorophene, *Pentachlorophenol, Sample preparation, Chemical recovery, Pollutant removal, Influents, Composite samples, Slimicides, Electron capture gas chromatography, Willamette River, Thin layer chromatography, Methylation, Chlorinated hydrocarbons.

Concentrations of hexachlorophene (HCP) and pentachlorophenol (PCP) in sewage and water samples have been analyzed by gas chromatography. Sewage influent or effluent or river water samples were acidified with 4 N H_2SO_4 and extracted three times with chloroform. The

chloroform extracts were dried with anhydrous Na2SO4 and evaporated to dryness in vacuo at 20C to minimize any losses of volatile components. The residues were dissolved in CH2Cl2-methanol (5:1), ethereal diazomethane added, and the mixtures allowed to stand for 30 min at room temperature. After methylation, and samples were evaporated to dryness in a stream of N2, redissolved in benzene, dried with Na2SO4, made up to 5 ml analyzed. HCP and PCP levels in 24-hr composite samples of sewage influent collected simultaneously from three Oregon cities ranged between 20-31 ppb and 1-5 ppb, respectively. Composite effluent values from these same sewage treatment plants were 6-12 ppb HCP and 1-4 ppb PCP, reflecting a 60-70 percent removal of HCP and a 4-28 percent removal of PCP. Analyses of daily and hourly water samples from the Willamette River collected just upstream from the city of Corvallis, Oregon, showed that HCP and PCP were present in river water in concentrations varying between 0.01-0.1 ppb and 0.10-0.70 ppb, respectively. Conventional processing of raw Willamette River water at the Corvallis Taylor water treatment plant removed about 60 percent of the HCP and PCP originally present in the water leaving about 40 percent of these chlorophenols in the finished drinking water. Identifications of HCP and PCP in sewage effluent and influent, Willamette River water and treated drinking water were confirmed by mass spectrometry. (Holoman-Battelle)

Many extensive studies are now being conducted throughout the world on the quality of water in rivers, lakes and streams. Analyses of grab samples collected from a number of major bodies of water are presented in tabular form. It is important to note that grab sample results are of value only when related to a number of collection factors. The analysis of these samples is for the purpose of general information only. R. Bock, and S. Strecker.
Zeitschrift fur Analytische Chemie, Vol 266, No 2, p 110-116, July 23, 1973. 8 fig, 10 tab, 9 ref.

Descriptors: *Fluorides, *Aqueous solutions, *Chemical analysis, *Separation techniques, Pollutant identification, Solvent extractions, *Gas chromatography, Chemical reactions, Chemical precipitation, Absorption.
Identifiers: *Trace levels, Flame ionization gas chromatography, Detection limits, Organic solvents, m-Xylene, Coprecipitation, Methylene chloride, Tetraphenyl antimony hydroxide, Triethyl silicon fluoride.

Traces of fluoride can be separated from aqueous solution by extraction with (C2H5)3SiCl in m-xylene or with (C6H5)4SbOH in CH2C12. Furthermore, several coprecipitation reactions were tested; absorption on hydroxyl apatite is most suitable. Determination of 0.05 microgram fluoride/ml can be performed by gas chromatography of (C2H5)3SiF in m-xylene using flame ionisation detectors; but variable blanks of 0.5-1.5 micrograms fluoride normally prevent the determination of less than ca. 3 micrograms fluoride. Identifiers: Atomic absorption spectrophotometry, Enrichment, *Sample preparation, Metal chelates.

Activated carbon can be used as collector material in trace analysis. Due to the special character of activated carbon, not only insoluble compounds can be enriched, but also many soluble chelate complexes of trace elements. For that purpose the buffered aqueous solution of the analytical sample containing complexing or precipitating reagents is filtered through a small filter paper covered with 50 mg of activated carbon. The trace compounds, and in many cases also the surplus reagent are adsorbed by the collector. By treating the carbon collector with acid after the process of trace enrichment, a trace concentrate free of unwanted substances is obtained. Thus it is possible to use sensitive electrochemical and optical methods for the determination. For the determination of the enriched elements by atomic absorption spectrometry, the activated carbon suspended in diluted nitric acid can be dispersed directly into the atomizer. The carbon particles do not cause any interferences. The application and the advantages of activated carbon for enrichment of trace elements in high-purity materials is demonstrated by some analytical examples. (Holoman-Battelle)

Identifiers: *Uranium, Tri-n-octylphosphine oxide, *Solvent systems, Preconcentration, Ionic interference, Ion exchange resins, Organic solvents.

A method has been developed for the separation of uranium that is based on systematic studies of the behavior of uranium in various water-organic solvent systems containing tri-n-octylphosphine oxide (TOPO) towards various anion forms of the strongly basic anion exchanger Dowex 1,X8. In this procedure, the uranium is extracted from a 1 N hydrochloric acid solution containing ascorbic acid into diethyl ether and adsorbed from a mixture consisting of 50 vol. percent ether (0.1 N in TOPO), 45 vol. percent methylglycol and 5 vol. percent 12 N hydrochloric acid on the ion exchanger (chlorid form). Following elution with 1 M hydrochloric acid, the uranium is determined either fluorimetrically or spectrophotometrically by the thiocyanate method. By means of this anion exchange procedure, it is possible above all to separate the uranium from all ions interfering with

its fluorimetric or spectrophotometric determination and also from TOPO itself. In particular, consideration is given to the spectrophotometric determination of the uranium in the presence of larger amounts of molybdenum, and a method was worked out for the removal of this element. NATURE AND STABILITY OF COMPLEX MERCURY COMPOUNDS IN SURFACE AND GROUND WATERS,
Auburn Univ. Ala. Dept. of Chemistry.
J. E. Land, W. R. Mountcastle, H. T. Peters, and D. R. Holt.
Available from the National Technical Information Service as PB-226 226 $3.50 in paper copy, $1.45 in microfiche. Alabama Water Resources Research Institute Auburn Bulletin 17, 1973. 46 p, 3 fig, 4 tab, 3 append. OWRR A-028-ALA (1).

Descriptors: Water pollution, Groundwater, Chemical properties, *Mercury, *Pollutant identification, *Ions, *Electrodes.
Identifiers: *Methylmercury Compounds.

Attempts to determine the stability constants for the methylmercury phosphato and diphosphato complexes at 25C in an aqueous media and with an ionic strength of 0.10 M (with KNO3) through the use of electromotive force measurement and half-wave potentials from the dropping mercury electrode are described. No positive results were recorded using a chloride selective ion electrode; however, a glass-nitrate selective ion electrode combination yielded reproducible and meaningful values when a solution of the ligand and methylmercury ion were titrated with standard nitric acid. Calculations of stability constants proved to be impossible since the quoted constants for the hydrolysis of the methylmercury cation are apparently in error, and corrective efforts are outlined. Reduction waves of the methylmercury chloride and hydroxide species in solution are presented and explained by postulated mechanisms involving free radical intermediates.

HEAVY METALS IN THE MAIN STREAMS OF THE JAMES RIVER BASIN, MISSOURI,
Missouri Water Resources Research Center, Rolla.
P. D. Proctor, and R. J. Lance.
Available from the National Technical Information Service as PB-226 253 $3.50 in paper copy, $1.45 in microfiche. Completion Report, August 29, 1973. 60 p, 21 fig, 5 tab, 30 ref, append. OWRR A-066-MO- (1).

Descriptors: *Missouri, *Heavy metals, Streams, Seasonal, Geology, Mineralization, Physical properties, Cadmium, Copper, *Lead, *Zinc, Iron, Hydrogen ion concentration, Temperature, Alkalinity, Specific conductivity, Mercury, Mining.
Identifiers: *James River (Mo.).

Demand for water in the James River basin has greatly increased. Larger numbers of industrial plants and the presence of lead-zinc prospects in the basin are potential sources of heavy metal additions to the waters of the area. This study determines selected heavy metal content and distribution in the streams of the basin and establishes some heavy metal bench mark values for this time period. Approximately 50 water samples were collected in each of three seasons. These samples were analyzed by atomic absorption techniques. Temperature, specific conductance, pH, and effective alkalinity were measured in the field. Ranges of heavy metal content were: (1) mercury-greater than 0.1-0.3 ppb (summer only); (2) zinc-less than-80 ppb; (3) copper-less than 1-18 ppb; (4) lead-less than 1-41 ppb; (5) cadmium-less than 1-7 ppb; and (6) iron-less than 50-277 ppb. The urban areas of Springfield contribute dissolved heavy metals to the surface streams. The Southwest Springfield Sewage Treatment Plant is not a significant source. Seasonal and geographic variations are also apparent. Heavy metal contributions appear to be related to mineralized and faulted areas in the basin. Variation of heavy metals at individual sample sites is not considered of great significance. Filtered water samples meet PHS heavy metal standards for public drinking water.

NITROGEN, PHOSPHORUS, AND TRACE ELEMENTS IN FLORIDA SURFACE WATERS, 1970-71,
Geological Survey, Tallahassee, Fla.
B. F. Joyner.
Open-file report 73 028, 1973. 30 p, 1 fig, 2 tab, 6 ref.

Descriptors: *Nitrogen, *Phosphorus, *Trace elements, *Surface waters, *Florida, Sampling, Water analysis, Chemical analysis, Analytical techniques, Data collections, Rivers, Streams, Lakes, Estuaries, Water pollution.

Nitrogen, phosphorus, and trace-element data are summarized for samples collected at 99 selected surface water stations in Florida in 1970-71. The data were collected in cooperation with many state, county, local, and federal agencies. The network stations were selected to provide water-quality information on (1) the major stream systems in Florida under differing hydrologic regimens, (2) streams either little affected or greatly affected by man's activities, (3) lakes either little affected or greatly affected by man, (4) streams with high organic color, (5) selected major springs and (6) selected estuaries. The locations of the stations are shown on a map. The field and laboratory determinations are tabulated. Also given are sample collection procedures, sample preservation, and laboratory analytical methods. (Woodard-USGS)

SYSTEM FOR MONITORING CONTAMINANTS IN LIQUIDS,
F. J. Bogusz.
U. S. Patent No. 3,762,214, 3 p, 4 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 915, No 1, p 72, October 2, 1973.

Descriptors: *Patents, *Water quality, *Pollutants, *Monitoring, Data processing, *Water pollution.
Identifiers: *Sensors, Electrical equipment.

A water pollution monitoring system is provided which may be coupled with data handling and processing equipment. Levels of pollutants are detected by means of sensors and an electrical signal corresponding to the pollutant level is processed for recording and/or transmission. Means are provided for automatic periodic cleaning of the sensors so that a high level of accuracy can be maintained for an extended period of time. A variety of signal conditioning circuits as well as the limit alert module, data sampling devices and an ultrasonic transducer are located within a water-tight compartment of the systems container. The data sampling sequencer may be switched into the data acquisition channels to systematically sequentially sample the various parameters of the media being monitored. A reference pulse is provided to allow a data analyst to determine and correlate the data with respect to the various sensors. (Sinha-OEIS)

5B. Sources of Pollution

A STUDY OF FACTORS INFLUENCING THE NITROGEN AND PHOSPHORUS CONTENTS OF NEBRASKA WATERS,
Nebraska Univ., Lincoln. Dept. of Agronomy.
J. Muir, E. C. Seim, and R. A. Olson.
Journal of Environmental Quality, Vol 2, No 4, p 466-470, October-December 1973. 1 fig, 5 tab, 14 ref.

Descriptors: *Water pollution sources, *Nitrogen, *Phosphorus, *Nebraska, Fertilizers, Leaching, Farm wastes, Waste disposal, Irrigation.

The magnitudes and sources of nutrient N and P in Nebraska waters were determined. There is little relation between N and P concentrations of the water and agricultural use of fertilizers. Nutrient levels in the water are governed more by human and livestock densities and intensity of irrigation development than by agronomic production factors. Only at sites of intensive irrigation development on very sandy soils and with irrigation of valley positions of shallow water table has fertilizer N contributed substantially to a reduction in groundwater quality. Nutrient concentrations in streams fluctuate widely with varied time and rate of organic waste intrusions and subsequent biological

assimilation and with major runoff events. Reservoirs on streams also have a major modifying action in reducing sediment and fertility load. The observed higher N content of streams during periods of peak flow can be attributed partially to the high N content of precipitation and its direct runoff into streams during periods of high rainfall intensity. (Knapp-USGS)

AGRICULTURAL CHEMICALS IN SURFACE RUNOFF, GROUND WATER, AND SOIL: 1. ENDRIN,
Agricultural Research Service, Baton Rouge, La.
G. H. Willis, and R. A. Hamilton.
Journal of Environmental Quality, Vol 2, No 4, p 463-466, October-December 1973. 4 tab, 11 ref.

Descriptors: *Path of pollutants, *Endrin, Pesticide kinetics, Chlorinated hydrocarbon pesticides, Runoff, Water pollution sources, Soil water, Groundwater, *Agricultural chemicals.

Endrin was applied at a rate of 0.337 kg/ha to sugarcane plots instrumented to sample surface runoff and groundwater. Runoff, groundwater, and soil samples were collected over a 2-year period and analyzed for endrin. Only small amounts of endrin were lost annually in runoff (less than 0.2% of that applied), and little endrin accumulated in soil. Trace amounts of endrin appeared to move through soil in the plots but not through soil columns. A delay of 72 hours between application and rainfall decreased the amount of endrin in runoff, groundwater, and soil. (Knapp-USGS)
W74-02152

MINIMIZING NITRATE SEEPAGE FROM THE HULA VALLEY INTO LAKE KINNERET (SEA OF GALILEE): 1. ENHANCEMENT OF NITRATE REDUCTION BY SPRINKLING AND FLOODING,
Technion-Israel Inst. of Tech., Haifa. Soils and Fertilizers Lab.
A. Raveh, and Y. Avnimelech.
Journal of Environmental Quality, Vol 2, No 4, p 455-458, October-December 1973. 3 fig, 4 tab, 11 ref.

Descriptors: *Nitrates, *Leaching, *Water pollution control, *Sprinkler irrigation, Flooding, Denitrification, Organic soils, Water pollution sources, *Path of pollutants.
Identifiers: *Israel (Hula Valley).

Decomposition of organic matter in the drained soils of the Hula Valley, Israel, leads to the accumulation of nitrates. These are leached during the rainy season to the Jordan River and endanger Lake Kinneret. Field studies show that nitrates can be reduced through the use of the irrigation systems existing in the area. Either sprinkling or flooding by raising the water table reduced the nitrate concentration to about half of its original amount. Both treatments induced anaerobic conditions in the soil and reduced the nitrate contents, probably by dentrification. The efficiency of the reduction depends on the existence of labile organic substrates in the soil. (Knapp-USGS)
W74-02153

PLANT NUTRIENT CONCENTRATIONS IN RUNOFF FROM FERTILIZED CULTIVATED EROSION PLOTS AND PRAIRIE IN EASTERN SOUTH DAKOTA,
South Dakota State Univ., Brookings. Dept. of Soils.
E. M. White, and E. J. Williamson.
Journal of Environmental Quality, Vol 2, No 4, p 453-455, October-December 1973. 3 tab, 6 ref.

Descriptors: *Nutrients, Runoff, *Fertilizers, *Erosion, *Grasslands, Water pollution sources, *Path of pollutants, *South Dakota, Agriculture.

Runoff waters from fertilized erosion plots and from native prairie in South Dakota were compared to determine the effect agriculture has had on water quality. Calcium, Mg, K, Na, total P, PO4-P, NO3-N, and NH4-N contents were found to be similar in runoff from the erosion plots and from the prairie. The elemental contents in runoff from erosion plots planted to oats, corn, and alfalfa or fallowed were not distinctly different and varied from year to year. Variations in the ions in water collected from different basins in the prairie may be caused by differences in the prairie vegetation and mulch in the drainage basins, in the time the runoff has to dissolve ions because of different overland flow distances, and in the dilution of the runoff by precipitation that falls directly into the basin. Losses of plant nutrients in soil eroded from cultivated land may be similar to average losses that would occur naturally if the area were in pristine prairie that was periodically subjected to fire. (Knapp-USGS)
W74-02154

SIGNIFICANCE OF PH AND CHLORIDE CONCENTRATION ON BEHAVIOR OF HEAVY METAL POLLUTANTS: MERCURY (II), CADMIUM (II), ZINC (II), AND LEAD (II),
Soil and Irrigation Research Inst., Pretoria (South Africa).
H. C. H. Hahne, and W. Kroontje.
Journal of Environmental Quality, Vol 2, No 4, p 444-450, October-December 1973. 10 fig, 4 tab, 17 ref.

Descriptors: *Heavy metals, *Hydrolysis, *Chlorides, *Mercury, *Cadmium, *Zinc, *Lead, Solubility, Water pollution sources, Hydrogen ion concentration.
Identifiers: Complex ions.

The degrees to which Hg (II), Cd (II), and Pb (II) complex with hydroxyl and chloride ions were calculated to evaluate the significance of such complexation in natural systems. Both the hydroxy and chloride complexes may contribute to the mobilization of these heavy metal ions in the environment. Hydrolysis of Hg (II) becomes important at pH values above 1 whereas Pb (II), Zn (II), and Cd (II) hydrolyze above pH 5, 7, and 8, respectively. Chlorides complex with Hg (II) at chloride concentrations above 1 billionth M. Hydrolysis and chloride complexation of these heavy metal ions are important factors affecting the solubility of the sparingly soluble salts of these metal ions. This is most pronounced for mercuric salts. Intrinsic solubilities of the metal-ion hydroxides allow for 160 ppm Zn (II) and 107 ppm Hg (II) to be soluble as complexed Zn (OH)2 and Hg (OH)2, respectively. These values are higher than calculated solubilities based on solubility products. An example of the competition between hydroxy and chloride complexes shows that at pH 8.5 and a chloride concentration range of 350-60,000 ppm, Hg (II) and Cd (II) are mainly complexed by chlorides. Zn (II) and Pb (II), under these conditions, are predominantly in the form of hydroxy complexes. (Knapp-USGS)
W74-02155

EXPERIMENTAL AND PREDICTED MOVEMENT OF THREE HERBICIDES IN A WATER--SATURATED SOIL,
Oklahoma State Univ., Stillwater. Dept. of Agronomy.
J. M. Davidson, and J. R. McDougal.
Journal of Environmental Quality, Vol 2, No 4, p 428-433, October-December 1973. 7 fig, 1 tab, 19 ref.

Descriptors: *Path of pollutants, *Herbicides, *Saturated soils, Saturated flow, *Soil water movement, Pesticide kinetics, Dispersion, Adsorption.

The equilibrium asorption characteristics of 1,1-dimethyl-3- (a,a,a-trifluoro-m-tolyl) urea (fluometuron), 4-amino-3,5,6-trichlor-opicolinic acid (picloram), and 2,4-bis (isopropylamino)-6-(methylthio)-s-triazine (prometryne) on Ca-saturated Norge loam soil were measured and were found to fit the Freundlich equation. A solution of each herbicide was displaced through a water-saturated column of Norge loam soil at various average pore-water velocities (5.6 to 0.57 cm per hour) and effluent samples evaluated to determine the importance of adsorption kinetics to the mobility of the herbicide. The displacement of each herbicide through the soil was significantly influenced by the average pore-water velocity. The use of a kinetic adsorption model in a convective transport equation did not adequately predict the shape of the effluent concentration distribution at the high pore-water velocities, but did give the left-hand shift exhibited by the data. The tailing noted in all the herbicide effluent concentration distributions resulted primarily from the nonsingularity between the adsorption-desorption process. Equilibrium adsorption and desorption isotherms were measured for picloram on Ca-saturated Norge loam soil. (Knapp-USGS)
W74-02156

EFFECT OF FEEDLOT MANURE ON SOIL AND WATER QUALITY,
Department of Agriculture, Lethbridge (Alberta). Research Station.
T. G. Sommerfeldt, U. J. Pittman, and R. A. Milne.
Journal of Environmental Quality, Vol 2, No 4, p 423-427, October-December 1973. 3 fig, 4 tab, 19 ref.

Descriptors: *Farm wastes, *Nitrates, *Phosphorus, *Water pollution sources, *Feed lots, Soil water, Cattle, Water pollution effects, *Canada.

Research was conducted to determine the contribution of representative feedlots in semiarid southern Alberta to soil and water pollution and to determine the effect of long-term applications of manure on the N, P, and soluble salt content of cultivated soil under irrigation. The NO3-N and available P content of the surface soil adjacent to the feedlots was generally greater than that of the soil away from the feedlots, but at depths greater than 150 cm the differences were usually small. Similarly, the concentration of NO3-N and P in the groundwater at 1- to 5-m depths was usually increased only adjacent to the feedlot and, with minor exceptions, remained within safe limits most of the time. There was no evidence that a small lake or three permanent streams near feedlots were polluted by effluents from the feedlots. Manure applied annually for 40 years at a rate of 70 metric tons per ha did not cause an undesirable buildup of N, P, or soluble salts in the soil. (Knapp-USGS)

DISPERSION IN FLOW FROM A CONTINUOUS SOURCE AT SEA,
Liverpool Univ. (England). Dept. of Oceanography.
K. F. Bowden, and R. E. Lewis.
Water Research, Vol 7, No 11, p 1705-1722, November 1973. 9 fig, 6 tab, 21 ref.

Descriptors: *Dispersion, Diffusion, *Path of pollutants, Sea water, Dye releases, Dye dispersion, Fluorescent dye.
Identifiers: *Scotland (Holy Loch), Irish Sea.

Diffusion experiments, using a continuous release of fluorescent dye from an anchored source, were

carried out in the Holy Loch and two coastal areas of the Irish Sea. In each case the dye distribution was sampled by a vessel making a series of crossings of the plume. The data were analyzed in terms of the standard deviation of the dye distribution at right angles to the axis of the plume, as a function of the diffusion time, and the corresponding eddy diffusion coefficient. In general the diffusion coefficient increased with time up to a diffusion time of at least 2 h. In many cases the relation was approximately linear, corresponding to spreading with a constant diffusion velocity. The observed median values of diffusion velocity for the Holy Loch, Red Wharf Bay and the area of the Irish Sea off the Cumberland coast were 0.4, 1.1 and 1.4 cm per sec. The vertical diffusion was also analyzed, but in less detail, and other features of the plumes, including their variability, are discussed. In general the rates of diffusion in the Holy Loch are similar to those reported for the Great Lakes and for coastal sea areas with weak currents and high stability. In the two Irish Sea areas the diffusion rates are similar to one another but considerably greater than in the Holy Loch. (Knapp-USGS)
W74-02163

DETERMINATION OF THE MECHANICAL COMPATIBILITY OF POROUS ROCKS WITH WASTE WATER IN ITS SUBSURFACE DISPOSAL,
Ustredni Ustav Geologicky, Brno (Czechoslavakia).
M. Strnad, and D. Novotny.
Water Research, Vol 7, No 11, p 1599-1607, November 1973. 2 fig, 5 tab, 11 ref.

Descriptors: *Clogging, *Silting, *Injection wells, *Waste disposal wells, Porosity, Permeability, Particle size, Industrial wastes.

The effect of waste water suspended solids on the permeability of the disposal horizon may be determined on the basis of rock pore size distribution measurements made by means of a mercury pressure porosimeter. The results approach laboratory measurements for smaller particles, and for particles of 0.00075 cm radii they are practically coincident. The method is useful for economic calculations of surface facilities for waste water treatment. The method can also be applied to similar problems concerning the injection of water into wells for the purposes of secondary oil recovery (water flooding). (Knapp-USGS)

AN INVESTIGATION OF THE PHYSICAL EFFECTS OF THERMAL DISCHARGES INTO CAYUGA LAKE,
Calspan Corp., Buffalo, N.Y.
T. R. Sundaram, C. C. Easterbrook, K. R. Piech, and G. Rudinger.
Technical Report, 74 fig, 9 tab, 141 ref, 306 p, November 1969.

Descriptors: Lakes, Powerplants, *New York, *Thermal pollution, Water pollution effects, *Lake stratification, Water pollution sources, Outlets.
Identifiers: *Cayuga Lake (N.Y.), *Thermal plume, Epilimnetic characteristics.

An analytical study of the physical effects of thermal discharges from power plants into a stratified lake are considered. Specifically, the possible physical consequences of the thermal discharges from a proposed nuclear power plant on the thermal structure of Cayuga Lake, New York are predicted. The effects of the thermal discharges are analyzed in two separate spacial and temporal scales. In the first scale, which is termed the near-field scale, the effects of the thermal discharges on the region in the immediate vicinity of the outfall are considered. The behavior of the thermal plume as a function of the changing meteorological conditions above the lake and as a function of the outfall configuration are discussed. The effects of the power-plant intake on the thermocline are also discussed. In the second scale, which is termed the far-field scale, the effects of the heated discharges on the thermal structure of the entire lake are considered. In particular, the effects of the discharges on the epilimnetic characteristics and the stratification period of the lake are given. The various transient motions (such as internal seiches) that occur in a stratified lake are also analyzed.

PERSISTENT SEA-FOAM MASSES — A PROBLEM SOLVED,
Calspan Corp., Buffalo, N.Y.
R. E. Baier.
Australian Natural History, p 162, March 1972.

Descriptors: Lakes, *Foaming, Water pollution control, Water pollution sources, *New York, Eutrophication, Frothing, Surfactants.
Identifiers: *Sea-Foam Masses, *Lake Chautauqua (N.Y.).

The curious nature of the great masses of foam, which are often found drifted in from the sea onto local rocks and beaches, was researched. It was observed that these lather-like masses persisted for relatively long periods, even when blown about by the wind. In Lake Chautauqua, the proteinaceous material was found to give rise in billowing heaps of foam along the windward shore, and to have its origin in a large algae bloom. An explanation of the phenomenon of foam formation could be that during storms, large numbers of planktonic organisms were destroyed and the debris from these minute organisms lowered the water surface tension to allow it to foam and stabilized the froth once it was formed.

ON THE RELATION BETWEEN THE OCCURRENCE OF DESMIDS AND THE SALINITY IN THE HOKURIKU DISTRICT OF JAPAN, (IN JAPANESE).
Nijo Junior High School, Kyoto (Japan).

Bull Jap Soc Phycol. Vol 20, No 3, p 101-110. 1972. Illus. (English summary).
Identifiers: Brackish water, Closterium-Parvulum, *Closterium-spp, Cosmarium-spp, *Desmids, *Japan (Hokuriku), *Salinity, Staurastrum-spp.

Five lakes and their rivers in the Hokuriku district of Japan were surveyed. The desmids of this district are composed of 5 genera and 53 spp., of which 51 belong to the genera Closterium, Cosmarium and Staurastrum. The desmids are widely distributed in fresh water, but few of them occur in brackish water of low salinity. Judging from the survey, their adaptable range chlorinity reached to 500 mg/l except that Closterium parvulum seems to tolerate about 1500 mg/l.--Copyright 1973, Biological Abstracts, Inc.

CALCULATION OF DOSE CONVERSION FACTORS FOR 60CO GAMMA RADIATION IN WATER, (IN GERMAN),
International Atomic Energy Agency, Vienna (Austria).
H. H. Eisenlohr, and R. Abdelin-Zadeh.
Strahlentherapie. Vol 143, No 4, p 410-415. 1972. Illus. (English summary).
Identifiers: Calculations, *Cobalt-60, *Dose conversion, *Gamma radiation, Water pollution sources.

The dose conversion factors, f and g, and the water-air-ratio were calculated for 60Co gamma radiation and water as a ratio of the corresponding depth-doses. Results agreed with the recommended values. The dose conversion factors f and g, were independent of both depth in water and field size within the regions investigated.--Copyright 1973, Biological Abstracts, Inc.

SALT, A LITTLE-KNOWN AGGRESSOR IN OUR ENVIRONMENT, (IN FRENCH),
Neuchatel Univ. (Switzerland). Centre de Hydrogeologie.
B. Kubler.
Bull Soc Neuchatel Sci Nat. 95 p 133-163. 1972. Illus. (English summary).
Identifiers: Environmental effects, *Salts, *Switzerland.

The worldwide production and consumption of salt increases faster than the population. This translates into an encroachment on the environment. The salts resulting from industrial activity which attack the soil, the water and the atmosphere are, without doubt, the most serious, but they are easily detected. The daily or seasonal consumption by small non-industrial communities is alarming in its progress. This increase, which is almost logarithmic, is due to the rapid development of water-softener installations and to the salting of roads, which adds to the pollution already caused by automobiles. For example, in Switzerland, the consumption of deicing salt increased from 10,000 to 128,000 tons/yr between 1960 and 1970. If this progression were to continue, it would reach 1,200,000 tons by 1980. Therein lies the grave danger to the biotopes in rivers and lakes, the difficulties to be overcome by the water filtration plants and the problem of the drinking water supply.--Copyright 1973, Biological Abstracts, Inc.

SOIL POLLUTION FROM CATTLE FEEDLOTS IN GEORGIA,
Georgia Univ., Athens. Dept. of Agronomy.
H. W. Fordham.
Available from NTIS as PB-226 083 $4.75 in paper copy, $1.45 in microfiche. M S Thesis, January 1973. 44 p, 9 fig, 10 tab, 34 ref. OWRR A-031-GA (2). 14-31-0001-3810.

Descriptors: *Feed lots, *Cattle, *Nitrates, Water pollution sources, *Farm wastes, *Georgia, Soil chemistry, Nutrients, Soil analysis.
Identifiers: *Goundwater pollution sources.

Soil samples were taken from 21 beef cattle feedlots in Georgia. Samples to 122 cm depth were taken upslope, within and approximately 30 and 90 m downslope from the lots. Soil samples were analyzed for extractable NO3, NO2, NH4, P, K, Ca, Mg, and for electrical conductivity, pH and organic matter. Soil nitrate was considerably less in the Georgia feedlots than in those in the more arid regions of the west and midwest. The average topsoil nitrate in feedlots was less than 20 ppm. Nutrients other than potassium did not show apprciable movement into the soil profile. It is concluded that pollution of ground water from beef cattle feedlots is probably not significant in Georgia. (Giddens-Georgia)

THE EFFECTS OF TRACE METALS ON GROUND WATER QUALITY AS INFLUENCED BY SOILS REFLECTING DIFFERENCES IN ORGANIC MATTER CONTENT AND GENETIC CONDITIONS,
Tuskegee Inst., Ala.
F. Ponder, Jr.
Available from the National Technical Information Service as PB-226 142, $5.50 in paper copy, $1.45 in microfiche. M.S., Thesis, May 1971. 61 p, 10 fig, 9 tab, 65 ref. OWRR B-028-Ala (4).

Descriptors: *Metals, *Zinc, *Absorption, *Organic soils, *Leaching, Soil chemistry, Water quality, Soil types, Acidic soils, Muck soils, Silts, Loam, Soil water movement, Percolation, Porosity, Drainage effects, Runoff, Ion transport, Chelation, Analysis, *Path of pollutants, Water pollution sources.

A review of literature on the correlation between organic matter and zinc content of soil and an investigation of zinc absorption using four different types of soil are presented. These soils were: Alaskan soil, a low humic glei soil with low pH and high in free iron oxides; muck, with a high pH and great amount of organic matter; Norfolk soil, loose, sandy, well-drained and well aerated; and Nebraska soil, which was a crofton silty clay loam. These soils, which were selected to represent a wide range of organic matter contents and genetic conditions, were prepared and submitted to studies of zinc adsorption and leaching. Soil and runoff water were analyzed for zinc content. The quantity of zinc absorbed by the soil increased as the organic content of the soil increased. Alaskan soil formed under very acid conditions absorbed less zinc than the muck soil. Potassium ions replaced large quantities of zinc from all the soils studied. It is concluded that organic matter is mainly responsible for the retention of zinc or other divalent metal by forming stable complexes. Groundwater having passed through soils high rather than low in organic matter will contain lesser quantities of divalent cations. (Jerome-Vanderbilt)

Gig Sanit. Vol 37, No 3, p 77-79. 1972.
Identifiers: Activated charcoal, Adsorption, *Charcoal-chloroform extraction, Evaluation, Methodology, *Organic wastes, *USSR, Water pollution sources, Reservoirs.

Experimental investigations were done from 1967-1970 for the purpose of using the charcoal-chloroform extraction (CCE) method for determining pollution in the Kama and Votkin reservoirs, USSR. The program included a quantitative measurement of water pollution by the CCE method, separation of the extracts into fractions, identification of the fractions, and isolation of individual components. An investigation of the extracts obtained permits not only differentiating individual water samples with respect to their degree of pollution by organic substances but also determining the qualitative composition of the pollutants.--Copyright 1973, Biological Abstracts, Inc.

OCCURRENCE OF SAPROCHAETE SACCHAROPHYLA COKER ET SHANOR IN FUNGOID GROWTH BELOW THE DISCHARGE OF BREWERIES, (IN CZECH),
J. Hauslerova.
Ceska Mukol. Vol 26, No 4, p 233-237. 1972. Illus. (English summary).
Identifiers: *Breweries, Classification, Ecological studies, *Fungoid growth, Fusarium-Aqueductuum, Geotrichum-Candidum, Helicocephalum-Sp, Leptomitus-Lacteus, Mucro-Fragilis, Mucor-Globosus, Rhizopus-Nigricans, *Saprochaete-Saccharophyla, Seasonal, Industrial wastes, *Czechoslavakia (Bohemia).

Downstream of the waste water outflow from the brewery at Vysoky Chlumec (Bohemia, Czechoslovakia) a considerable growth of fungi filaments is ascertained throughout the year. The permanent investigation of this growth, from April 1970 to Feb. 1971, revealed that their composition is almost stable. The following species were observed: Fusarium aquaeductuum (Rad. et Rabenh.) Sacc., Leptomitus lacteus (Roth) Agardh, Geotrichum candidum Link ex Pers., Rhizopus nigricans Ehrenb., Mucor globsus Fisch., M. fragilis Bain., Helicocephalum sp., and Saprochaete saccharophyla Coker et Shanor, which during the period between Sept. 1970 and Jan. 1971 were found in large quantities. The systematical inclusion of S. saccharophyla still remains an open question. The occurrence of this organism is mentioned mostly in wastes and highly polluted waters, and so it can be considered as a member of the biocenose of polluted waters.--Copyright 1973, Biological Abstracts, Inc.

THE ABILITY OF BACTERIA TO MINERALIZE ALGAE ORGANIC MATTER, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Institut Biologii Vnutrennykh Vod.
V. M. Kudryavtsev.
Akademiya Nauk SSSR, Moscow. Institut Biologii Vnutrennykh Vod.
Identifiers: *Algae organic matter, Aphanizomenon, Bacillus, *Bacterial decomposition, Bacterium, Micrococcus, Microcystis, Mycobacterium, Pseudomonas, Sarcina, Scenedesmus-Quadricauda, *USSR (Kaibyshev reservoir), *Mineralization.

The bacterial decomposition of cells of Scenedesmus quadricauda and the biomass of phytoplankton found on the Kuibyshev water reserve, where algae of Aphanizomenon and Microcystis predominate was studied. Strains (15) of pure cultures were also used from Pseudomonas, Bacterium, Bacillus and Sarcina, Micrococcus and Mycobacterium families in order to determine the organic carbon content of algae. Bacterial oxidation of S. quadricauda varied 17-36%, while the organic content of phytoplankton varied by 50-67%. In a mixture of all bacteria, the results were 27.4% and 51.6% which was close to lake content of 25.3% and 51.5%.--Copyright 1973, Biological Abstracts, Inc.

FIELD TESTS ON TRANSVERSE MIXING IN RIVERS,
Illinois Univ., Urbana. Dept. of Civil Engineering.
E. R. Holley.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY12, Paper 10241, p 2313-2331, December 1973. 14 fig, 2 tab, 11 ref, append.

Descriptors: *Mixing, *Diffusion, *Dispersion, *Path of pollutants, Waste disposal, Rivers, Streamflow, Jetties, Groins (Structures).

Five tests were made on transverse mixing in rivers. The transverse turbulent diffusion coefficient, averaged over long flow distances, was as much as three times larger than the value for an equivalent straight rectangular flume. This increase is due to the additional mixing associated with the protective groins which were present and with the helical motion resulting from channel bends. Net transverse velocities exist in rivers and can cause the local rates of transverse spreading to be significantly different from the rate associated with the average diffusion coefficient. Recommendations are given for conditions to be met in order to obtain meaningful data from field tests on rates of transverse diffusion in rivers. (Knapp-USGS)

CONTRIBUTION OF DEVELOPED AND NATURAL MARSHLAND SOILS TO SURFACE AND SUBSURFACE WATER QUALITY,
Wisconsin Univ., Madison. Dept. of Soil Science.
N. A. Isirimah, and D. R. Keeney.
Available from the National Technical Information Service as PB-226 071, $4.00 in paper copy, $1.45 in microfiche. Wisconsin Water Resources Center, Madison, Technical Report, September 1973. 30 p, 9 tab, 1 fig, 44 ref. OWRR A-049-WIS (1). 14-31-0001-3850.

Descriptors: *Organic soils, *Wetlands, *Marshlands, *Nitrogen, *Phosphorus, *Wisconsin, Water quality.
Identifiers: *Wingra watershed (Wis), Histosoils, Transformations.

Preliminary qualitative estimates of the role of natural and developed marshland soils as a nitrogen or phosphorus source or sink were obtained by a limited ground and surface water survey of a marsh adjacent to Lake Wingra, near Madison, Wisconsin and by laboratory investigations of nitrogen and phosphorus transformations in soil samples from this marsh and from an acid bog in northern Wisconsin. Results are presented on the rates and pathways of these transformations. The results indicate that the marsh does not act as a significant nutrient sink. Thus while removal of the marsh by draining or filling might result in more N and P entering the lake, its presence does not appear to be a factor in lowering lake productivity. Nutrient input into the lake probably could be lowered by discharging storm sewers on mineral soil rather than on the marsh.
W74-02327

WATER QUALITY CHARACTERISTICS OF STORM SEWER DISCHARGES AND COMBINED SEWER OVERFLOWS,
Illinois State Water Survey, Urbana.
V. Kothandaraman.
Circular 109, 1972. 19 p, 1 fig, 7 tab, 49 ref.

Descriptors: *Water pollution sources, *Outfall sewers, *Urban runoff, *Reviews, *Combined sewers, *Water quality, Separated sewers, Storm runoff, Storm water, Waste water treatment, Costs, Litter, Water pollution control, Pollutants, Heavy metals.

A study of the pollution from combined and separate storm sewers was made by reviewing pertinent case studies. A total of 49 references describing the quality characteristics of urban stormwater runoff were searched, with particular reference made to 25 of these studies. Suspended solids, volatile suspended solids, COD, BOD, total nitrogen, total phosphorus, and total coliform were compared for combined sewers, separate storm sewers, and raw sewage. Weibel, et al, (1966) found in studies in Cincinnati that separate storm runoff (annually) had the following loads as a percentage of raw sewage: suspended solids-160 percent, COD-33 percent, BOD-7 percent, total phosphate-5 percent and total nitrogen-14 percent. The American Public Works Association found that dirt and dust in street litter caused the most significant amount of pollution and varied from 0.4 to 5.2 pounds per day per 100 feet of curb. Proper street maintenance could minimize the pollutional effect of this material. Several mathematical models have been proposed to predict pollution of urban runoff. Two different models are described. Other studies have pointed out the effect of runoff pollution on streams and lakes. The estimated costs of solving pollution problems from urban runoff are given for various methods. Included are separation of sewers, chlorination, storage of water for later treatment, lagoon treatment, stream flow augmentation, and overflow treatment by grit chambers, settling tanks, and other methods. WATER QUALITY MANAGEMENT IN GROUNDWATER BASINS,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
A. K. Tyagi.
In: Papers, International Symposium on Water Resources Planning, Mexico City, Mexico Volume III, December 1972, 46 p, 71 ref.

Descriptors: *Groundwater, *Water quality, *Saline water intrusion, Encroachment, Coasts, Southwest U.S., Mixing, Saline water, Salinity, Sea water, Water pollution effects, Waste water (Pollution), Pollutants, *Waste water disposal, Waste disposal wells, Saline water-freshwater interfaces.
Identifiers: *Mexico (Sonora).

Oceanic and connate waters, irrigation return flows, fertilizers, disposal of saline waters by deep injection wells, lagoons and playas, and disposal of mine wastes are the sources of groundwater contamination in coastal and inland aquifers. Hydrodynamics of the phenomena of saline water intrusion from various causes is discussed. The status of intrusion in forty of the states in the U.S. and in six other countries is reviewed with emphasis on Arizona, California, New Mexico, and Israel. A special example of sea water intrusion in the Hermosillo coastal aquifer in arid northwestern Mexico is presented. Significant research developments and progress underway for analyzing the formation and maintenance of the transition zone between fresh and salt waters are also presented with special attention to the need for proper recognition of physical situations producing contamination so the problems can be avoided rather than discovered too late. (Muller-Arizona)

SOME CHEMICAL AND BIOLOGICAL CHARACTERISTICS OF THE MISSISSIPPI RIVER BORDERING IOWA,
Iowa Univ., Iowa City.
D. B. McDonald.
In: Water-1972, AIChE Symposium Series No 129, Vol 69, 1973, p 380-372. 1 tab, 3 ref.

Descriptors: *Mississippi River, *Water quality, *Freshwater fish, *Aquatic habitats, *Water pollution effects, Alkalinity, Biochemical oxygen demand, Calcium, Carbonates, Bicarbonates, Chemical oxygen demand, Chlorides, Fluorides, Hardness (Water), Nitrogen, Magnesium, Manganese, Ammonia, Nitrates, Hydrogen ion concentration, Phosphates, Potassium, Dissolved solids, Suspended solids, Silica, Sulfates, Specific conductivity, Industrial wastes, Domestic wastes, Agricultural runoff, Nutrients, Sphaerotilus, Orthophosphates, Pesticides, Fertilizers, Dissolved oxygen, Water pollution sources.

The portion of the Mississippi River which borders Iowa contains a variety of habitats, such as main channel, off-channel, lake, and slough areas, which support a wide variety of fish of sport and commercial significance. Over 50 species were identified in pool 14 alone. Studies of the water chemistry indicate that the water quality is good compared to streams within the state although there are limited stretches of river where deteriorated water quality conditions occur. Pollutants may also be introduced into the river as a result of runoff from agricultural land. Oxygen concentrations are usually adequate for fish life; however, low dissolved oxygen levels have been observed in slough areas accompanying the death and decay of large algal masses. (Little-Battelle)

DISTRIBUTION OF CAESIUM-137 IN BRITISH COASTAL WATERS,
Ministry of Agriculture, Fisheries and Food, Lowestoft (England). Fisheries Radiobiological Lab.
D. F. Jefferies, A. Preston, and A. K. Steele.
Marine Pollution Bulletin, Vol 4, No 8, p 118-122, August 1973. 4 fig, 2 tab, 13 ref.

Descriptors: *Distribution patterns, *Radioactive wastes, Coasts, Water analysis, Sea water, Waste dilution, Separation techniques, Industrial wastes, Path of pollutants, Monitoring, Water pollution sources, Water pollution effects, Nuclear reactors, Nuclear wastes.
Identifiers: *Cesium-137, *Gamma spectrometry, Irish Sea, North Sea, North Channel, Sample preparation.

Water samples were collected from the Irish Sea, the northeast Atlantic, Scottish coastal waters, and the North Sea for analysis of Cs-137 emanating from the Windscale nuclear fuel reprocessing plant for the purpose of determining distribution patterns and dilution of this effluent. Cs-137 was determined by filtering seawater through a 0.22-millimicron membrane filter using one-step separation with either ammonium dodeca-molybdophosphate or potassium cobaltihexacyanoferrate followed by gamma spectrometry. More than 90 percent of the total cesium was retained in the filtrate. The data suggest that water leaving the Irish Sea through the North Channel moves round the coastline in a clockwise direction closely confined to the coastal margins of Scotland and then enters the northern North Sea, where its southern penetration may be detected as far south as the northern coast of England. This type of distribution has far-reaching implications for the fate of materials introduced to coastal waters since even Cs-137, which is relatively conservative in seawater, is largely confined in its distribution to inshore waters. Those materials which are less conservative and thus more rapidly removed from the water mass will be even more restricted in their distribution as a consequence. These general conclusions confirm the need to concentrate monitoring and surveillance operations in coastal waters, since the majority of pollutants are introduced regularly and in largest quantity at or near the shoreline. (Little-Battelle)
W74-02365

SEASONAL CHANGES IN THE ORGANIC FORMS OF CARBON, NITROGEN AND PHOSPHORUS IN SEA WATER AT EL IN THE ENGLISH CHANNEL DURING 1968,
Southampton Univ. (England). Dept. of Oceanography.
M. W. Banoub, and P. J. leB. Williams.
Journal of the Marine Biological Association of the United Kingdom, Vol 53, No 3, p 695-703, August 1973. 6 tab, 26 ref.

Descriptors: *Water analysis, *Seasonal, *Carbon, *Nitrogen, *Phosphorus, *Sea water, Separation techniques, Colorimetry, Ammonia, Chlorophyll, Organic matter, Storage.
Identifiers: *English Channel, Dissolved organic carbon, Sample preparation, Infrared spectrophotometry, Organic nitrogen, Ultraviolet spectrophotometry, Orthophosphates, Sample preservation, Particulate matter.

Water samples were collected at monthly intervals during 1968 at Station El in the English Channel for analysis of organic C, N, and P to determine seasonal variations. Two aliquots from each sample were filtered for particulate N and C analysis through two glass fiber filters, one for analysis of organic C and one for organic N. The filtrate was frozen in clean bottles until analysis. The filters were washed with K2SO4 and H2SO4 to remove inorganic carbonates and stored in solid CO2. Particulate organic C was measured by infrared analysis of CO2 formed by combustion. Particulate N was measured by Kjeldahl combustion followed by colorimetric determination of ammonia by conversion to indophenol blue. Dissolved organic C was analyzed by the method of Menzel and Vaccaro (1964), total N and P were determined by uv irradiation; and chlorophylls were determined according to the recommendations of the SCOR/UVESCO report (1966). The average integral mean values were: dissolved organic carbon, 780 micrograms C/1; dissolved organic nitrogen, 64 micrograms N/1; dissolved organic phosphorus, 3.8 micrograms P/1. Dissolved organic carbon and the particulate organic carbon and nitrogen showed increases subsequent to the spring bloom; such increases were less evident in the dissolved organic nitrogen results and not apparent in those of dissolved organic phosphorus. (Little-Battelle)

DISSIPATION AND PHYTOTOXICITY OF DICAMBA RESIDUES IN WATER,
Texas A and M Univ., College Station. Dept. of Range Science.
C. J. Scifres, T. J. Allen, C. L. Leinweber, and K. H. Pearson.
Journal of Environmental Quality, Vol 2, No 2, p 306-309, April/June 1973. 3 fig, 3 tab, 17 ref.

Descriptors: *Pesticide kinetics, *Pesticide toxicity, *Phytotoxicity, Water pollution effects, *Pesticide residues, Environmental effects, Chlorinated hydrocarbon pesticides, Water analysis, Pollutant identification, Water pollution sources, Laboratory tests, Resistance, Plant growth, Bioassay, Persistence, Volatility, Soil contaimination, Path of pollutants, Herbicides, Water pollution, Microbial degradation, Water sampling.
Identifiers: *Dicamba, *Seedling crops, Dissipation, Fate of pollutants, Data interpretation, Banvel, Gas liquid chromatography, Cucumbers.

A study was conducted to evaluate (1) the influence of several environmental factors on dicamba dissipation from water, and (2) the biological significance of dicamba residues in water rela-

tive to growth and development of several crop species. Two south-central Texas ponds (only one was vegetated) were surface-sprayed with the dimethylamine salt of dicamba, and samples were taken and analyzed at 1, 3, 5, 7, 12, 15 and 20 days after treatment and thereafter at about 7-day intervals for an additional 70 days. Dicamba dissipation was studied under controlled greenhouse conditions using polyethylene containers under fluorescent lights. Dicamba concentrations in field samples were estimated using mustard seedling bioassay, spectrophotometric, and GLC techniques. Three greenhouse studies were conducted to evaluate seedling response of several crops to preemergence irrigation with water containing the herbicide. The herbicide dissipated most rapidly from water under non-sterile, lighted conditions. Pond sediment evidently contained microbial populations capable of decomposing the herbicide. Temperature was crucial in dicamba dissipation, especially in the presence of sediment. Influence of sediment on dissipation rate of dicamba was apparently augmented by light in some cases. Under summer conditions, dicamba at 4.4 kg/ha per surface area of ponds dissipated at about 1.3 ppm/day. Dicamba dissipated as a logarithmic function of concentration with time. Reaction of seedling crops to irrigation water containing dicamba varied among species and cultivars. Relative tolerance from these studies was ranked from most to least tolerant as follows: sorghum greater than cotton greater than cucumbers. (Holoman-Battelle)

CHLORODIOXINS IN PESTICIDES, SOILS, AND PLANTS,
Agricultural Research Service, Beltsville, Md. Agricultural Environmental Quality Inst.
C. S. Helling, A. R. Isensee, E. A. Woolson, P. D. J. Ensor, and G. E. Jones.
Journal of Environmental Quality, Vol 2, No 2, p 171-178, April/June 1973. 1 fig, 2 tab, 39 ref.

Descriptors: *Soil contamination, *Vegetation, *2 4 5-T, *Pesticide kinetics, *Toxicity, Water pollution sources, Persistence, Volatility, Absorption, Translocation, Pesticides, Plant tissues, Organic pesticides, Soils, Chemical analysis, Soil analysis, Wastes, Herbicides, Chlorinated hydrocarbon pesticides, Phenolic pesticides, 2 4-D, Herbicides, Fungicides, Acaricides, Insecticides.
Identifiers: *Chlorodioxins, Toxicology, *Pesticide formulations, Impurities, Chlorodibenzo-p-dioxins, Teratogenicity, Photodecomposition, Nitrofen, Volatilization, Chlorinated hydrocarbons, Dicamba, Trichlorophenol, Tetrachlorophenol, Pentachlorophenol, 2 4-DB, 2 4-DEP, Dichlorprop, Erbon, Sesone, Silvex, DMPA, Hexachlorophene, Ronnel.

Chlorodioxins, such as 2, 3, 7, 8-tetrachlorodibenzo-p-dioxin (TCDD), are highly toxic impurities found in certain pesticides. A review is made of (1) the sources and toxicology of TCDD and its relationship to the herbicide 2,4,5-trichlorophenoxyacetic acid (2,4,5-T), and (2) pesticide analyses and soil-related environmental studies of TCDD conducted by the U. S. Department of Agriculture. TCDD was persistent and immobile in soils. The dioxin was not detected, however, 6 years after abnormally high applications of 2,4,5-T to Lakeland sand. TCDD was not photodegraded on soil and only slightly, in aqueous suspension. Plants grown in soil containing 0.06 ppm TCDD had no detectable quantity (less than or equal to 1 ppb) at maturity. It was not translocated when applied to leaves, but washoff or volatilization occurred. TCDD was undetected (less than 50 ppb) in 19 bald eagle (Haliaeetus leucocephalus) carcasses. COMPLEX BEHAVIOUR OF COBALT IN THE DANUBE RIVER,
Institut za Nuklearne Nauke Boris Kildric, Belgrade (Yugoslavia).
R. Radosavljevic, T. Tasovac, R. Draskovic, M. Zaric, and V. Markovic.
Archiv fur Hydrobiologie, Suppl. 44, No 2, p 241-248, March 1973. 2 fig, 6 tab, 14 ref.

Descriptors: *Cobalt, *Bottom sediments, *Plankton, *Suspended solids, *Path of pollutants, Hydrobiology, Aquatic animals, Water pollution, Chemical analysis, Trace elements, Heavy metals, Cobalt radioisotopes, Pollutants, Absorption, Water analysis, Algae, Caddisflies, Gastropods, Clams, Oligochaetes, Mollusks, Mussels, Snails, Ion exchange, Fish, Soil analysis.
Identifiers: *Danube River, Transport, Chemical concentration, Bioaccumulation, Animal tissues, Co-60, Sava River, Tisa River, Luganer See River, Unter See River, Zuger See River, Vierwaldstatter See River, Biological materials, Leeches, Alburnus alburnus, Ion exchange capacity.

As a part of a program for investigating the pollution of the Danube and studying the behaviour of different pollutants introduced in the river, systematic investigations of the content of Cobalt-60 and inactive isotope have been carried out and their concentrations in water, suspended material, bed sediments, plankton and other components determined. The capture of cobalt by suspended particles and bed sediments has been studied. The behaviour of cobalt in the Danube River is complex and depends on many parameters. The interdependences between the content of cobalt in water and dispersed components in the river, biomaterials, macro-and microchemical elements indicate that biogeochemical transport in the river is very heterogenous and depends on hydrodynamical conditions. The empirical curves of cumulative frequency distributions of particular levels of cobalt in the cross-section of the river at the kilometer 1144 and 1137 have log-normal distributions and confirm that hydrodynamical conditions in the river play an important role in transport of cobalt. Results of field and laboratory experiments are presented. (Holoman-Battelle)

THE FORMATION OF WATER-IN-OIL EMULSIONS SUBSEQUENT TO AN OIL SPILL,
Nova Scotia Technical Coll., Halifax. Dept. of Chemical Engineering.
G. D. M. MacKay, A. Y. McLean, O. J. Betancourt, and B. D. Johnson.
Journal of the Institute of Petroleum, Vol 59, No 568, p 164-172, July 1973. 5 fig, 3 tab, 19 ref.

Descriptors: *Oil spills, *Chemical properties, Oil-water interfaces, Stability, Emulsifiers, Chemical analysis, Mass spectrometry, Isolation.
Identifiers: *Water-in-oil emulstions, *Emulsification, *Asphaltenes, *Crude oil, Stabilizing agent, Gas, Oil, Naphtha, Asphalt.

A series of experiments were carried out to obtain more information on the extremely stable water-in-oil emulsions formed when some hydrocarbon products are spilled at sea. It was established that the agent responsible for the stability was not a discrete chemical entity but was an asphaltenic type substance. The mechanism resulting in the stabilizing effect does not involve electrical double layer interaction, but is due to the mechanical strength of the asphaltenic layer encapsulating each water droplet. PHOTOLYSIS OF PARATHION (O,O-DIETHYL-O- (4-NITROPHENYL) THIOPHOSPHATE). NEW PRODUCTS,
Miami Univ., Oxford, Ohio. Hughes Labs.
J. R. Grunwell, and R. H. Erickson.
Journal of Agricultural and Food Chemistry, Vol 21, No 5, p 929-931, September/October 1973. 1 fig, 1 tab, 13 ref.

Descriptors: *Aqueous solutions, *Pollutant identification, Phosphothioate pesticides, Degradation (Decomposition), Irradiation, Organophosphorus pesticides, Pollutants, Environmental effects.
Identifiers: *Photolysis, *Parathion, *Degradation products, *Paraoxon, Photodecomposition, Triethylphosphate, O O O-triethylthiophosphate, O O S-triethylthiophosphate, Ethanol, Tetrahydrofuran, Mass spectra, Infrared spectra, Gas liquid chromatography.

Solutions of parathion and paraoxon were irradiated at 2537 A for varying amounts of time and for 6 hr, respectively, in order to identify the photolytic products. Photoproducts were identified by gas liquid chromatographic retention time, mass spectra, and infrared spectrum and by comparison with an authentic sample. O,O,S-Triethylthiophosphate was identified as the major product of the photolysis of parathion in aqueous THF or ethanol. Minor products were O,O,O-triethylthiophosphate, paraoxon, and triethylphosphate, which was formed by secondary photolysis of paraoxon. (Holoman-Battelle)

PERSISTENCE OF ENDOTHALL IN AQUATIC ENVIRONMENT AS DETERMINED BY GAS--LIQUID CHROMATOGRAPHY,
Syracuse Univ. Research Corp., N.Y. Life Sciences Div.
H. C. Sikka, and C. P. Rice.
Journal of Agricultural and Food Chemistry, Vol 21, No 5, p 842-846, September/October 1973. 3 fig, 1 tab, 9 ref.

Descriptors: Persistence, *Pesticide kinetics, *Aquatic environment, *Pesticide residues, *Radioactivity techniques, Herbicides, Water analysis, Hydrosols (Soils), Soil analysis, Aquaria, Pollutant identification, Gas chromatography, Aquatic soils, Chemical analysis, Farm ponds, Path of pollutants, Water sampling, Bottom sampling, Time, Methodology, Organic pesticides.
Identifiers: *Endothall, *Gas liquid chromatography, Fate of pollutants, Chemical recovery, Detection limits, Sample preparation, Thin layer chromatography.

A gas chromatographic method was used to determine the residues of endothall in both the water and hydrosoil of a farm pond and of laboratory aquaria. The bulk of endothall added to the aquaria remained in the water during the course of the experiment. Both in the pond and in the aquaria, the herbicide persisted in the hydrosoil for a longer period than in the water. In the pond treated with approximately 2 ppm of endothall, the herbicide could not be detected in the water and top 1 in. of the hydrosoil 36 and 44 days after treatment, respectively. In the aquaria treated with 2 and 4 ppm, endothall was reduced to nondetectable levels in the water within 7 days after treatment. It took 2 and 4 weeks for the herbicide in the hydrosoil to reach a level of less than 0.1 ppm in the aquaria treated with 2 and 4 ppm, respectively. The rate of endothall dissipation in the aquaria was similar at both application rates. (Holoman-Battelle)

RATES AND PRODUCTS OF DECOMPOSITION OF 2,2-DIBROMO-3-NITRILOPROPIONAMIDE,
Dow Chemical Co., Midland, Mich. Halogens Research Lab.
J. H. Exner, G. A. Burk, and D. Kyriacou.

Journal of Agricultural and Food Chemistry, Vol 21, No 5, p 838-842, September/October 1973. 3 fig, 4 tab, 19 ref.

Descriptors: *Microbial degradation, *Hydrolysis, *Pesticide kinetics, Environmental effects, Hydrogen ion concentration, Temperature, Chemical analysis, Pollutant identification, Soil contamination, Water pollution, Degradation (Decomposition), Bactericides, Chemical reactions, Carbon dioxide, Ammonia, Bromides, Polarographic analysis, Soil microorganisms, Halogenated pesticides, Organic pesticides, Water analysis, Aqueous solutions.
Identifiers: *Degradation rates, *Degradation products, Biocides, Nucleophiles, *Photodecomposition, 2 2-Dibromo-3-nitrilopropionamide, Fate of pollutants, Photolysis, Dibromoacetonitrile, Dibromoacetamide, Dibromoacetic acid, Glyoxylic acid, Oxalic acid, Sodium bisulfite, Cyanoacetamide, Sample preparation, Amides.

Rates and products of decomposition of 2,2-dibromo-3-nitrilopropionamide (DBNPA), an antimicrobial compound for industrial water treatment, were determined over a range of conditions. Rates of hydrolytic decomposition, determined polarographically at various pH's and temperatures, are consistent with acid- and base-catalyzed amide hydrolysis. Hydrolysis of DBNPA ultimately forms carbon dioxide, ammonia, and bromite ions via the following sequence of degradation products: dibromoacetonitrile, dibromoacetamide, dibromoacetic acid, glyoxylic acid, and oxalic acid. DBNPA reacts rapidly with various ions such as bisulfite to form cyanoacetamide. Decomposition under the influence of sunlight also leads to cyanoacetamide. Contact with soil and soil organisms degrades DBNPA. Decomposition of DBNPA by several chemical and biological pathways ensures that the compound will not persist in the environment. (Holoman-Battelle)
W74-02382

PICLORAM PHOTOLYTIC DECOMPOSITION,
Agricultural Research Service, Fort Collins, Colo.
A. R. Mosier, and W. D. Guenzi.
Journal of Agricultural and Food Chemistry, Vol 21, No 5, p 835-837, September/October 1973. 2 fig, 2 tab, 16 ref.

Descriptors: *Aqueous solutions, *Chemical analysis, *Radioactivity techniques, *Pollutant identification, Chlorinated hydrocarbon pesticides, Path of pollutants, Degradation (Decomposition), Herbicides, Gas chromatography, Irradiation, Separation techniques, Chemical reactions, Halogenated pesticides, Organic pesticides.
Identifiers: Fate of pollutants, *Picloram, *Photodecomposition, Quantitative analysis, Electron capture gas chromatography, Thin layer chromatography, Degradation products, Degradation pathway, Silver/silver chloride electrode, Scintillation counting, Decarboxylation.

Irradiation of a 0.00208 M aqueous solution of the picloram sodium salt with 300-380 nm ultraviolet light resulted in 99 percent degradation of the parent compound within 72 hr. After 5, 15, 25, 34, and 48 hr of irradiation, the amounts of picloram degradation were 15, 27, 31, 61, and 90 percent, respectively (all picloram solutions were analyzed as the methyl ester, solutions were methylated by diazomethane). After 34 hr of irradiation, 11 visually observable degradation products, excluding the spot of origin (spot no. 1) and parent compound (spot no. 13), were separated by tlc. Eight of these spots had radioactivity above background, which indicated that the carboxyl carbon (C-14) was still intact. No radioactivity was detected in the other three compounds, spots 5, 6, and 8, indicating decarboxylation. During photolysis, two chloride ions were produced per molecule of picloram photolyzed. Evidence was obtained to suggest that both a free radical and an ionic mechanism are involved in the photolysis of picloram. The overall reaction proceeds by a nonchain mechanism. (Holoman-Battelle)

CURRENT STATUS OF THE ENVIRONMENTAL AND HUMAN SAFETY ASPECTS OF NITRILOTRIACETIC ACID (NTA),
Little (Arthur D.), Inc., Cambridge, Mass.
P. S. Thayer, and C. J. Kensler.
CRC Critical Reviews in Environmental Control, Vol 3, No 4, p 375-404, September 1973. 2 fig, 15 tab, 74 ref.

Descriptors: *Nitrilotriacetic acid, Environmental effects, Pollutant identification, *Reviews, *Public health, *Biodegradation, *Toxicity, Water pollution effects, *Soil contamination effects, Surface waters, Water pollution sources, Metabolism, Animal physiology, Water pollution, Measurement, Path of pollutants, Sewage effluents, Sewage treatment, Rivers, Streams, Organic loading, Eutrophication, Plant growth.
Identifiers: Fate of pollutants, Sensitivity, NTA chelates, Degradation products, Substrate utilization, Degradation pathways, Mobilization, Enzymatic inhibitors, Teratogenicity, Mutagenicity, Carcinogenicity, Detergent builders, Iminodiacetic acid, Receiving waters, N-methyliminodiacetic acid, Sarcosine, Glycine, Sodium nitrilotriacetate, Sewage microorganisms, Shiwassee River, Hersey River, Raisin River, St. Joseph River, Detroit River, Black River, Total organic carbon, Meramec River, Acclimatization.

A review of the available experimental and field information on nitrilotriacetic acid (NTA) indicates a very low probability of environmental or human hazard at the maximally proposed levels of use in detergents. The probable average concentrations will be low, less than 25 parts per billion (ppb), in the domestic water supply and the high concentrations, 1,500 to 20,000 parts per million (ppm), required to produce adverse effects in animals appear to provide a more than adequate margin for safety. The probable effects on the environment, including contribution towards eutrophication of estuarine bodies of water, also appear to be minimal. The use of NTA in detergents should, however, be accompanied (1) by an environmental surveillance program to ensure that the probable low concentrations of NTA are the actual concentrations, and (2) a continuing research program to further assure environmental and human safety. (Holoman-Battelle)

THE DISTRIBUTION OF TRACE METALS AND FAUNA IN THE FIRTH OF CLYDE IN RELATION TO THE DISPOSAL OF SEWAGE SLUDGE,
Imperial Coll. of Science and Technology, London (England). Applied Geochemistry Group.
W. Halcrow, D. W. MacKay, and I. Thornton.
Journal of the Marine Biological Association of the United Kingdom, Vol 53, No 3, p 721-739, August 1973. 7 fig, 10 tab, 22 ref.

Descriptors: *Water analysis, *Heavy metals, *Sediments, *Sludge disposal, *Benthic fauna, *Marine fish, Calcium, Cadmium, Chromium, Copper, Iron, Manganese, Nickel, Lead, Zinc, Mercury, Carbon, Soil analysis, Water pollution effects, Absorption, Separation techniques, Sampling, Sewage disposal, Sewage sludge.
Identifiers: Atomic absorption spectrophotometry, Sample preparation, Silver, *Firth of Clyde, Sample preservation, Acid digestion, Preconcentration, Organic carbon, Background levels, Biological samples, Macroinvertebrates, Polychaetes, Liver, Muscle.

Sediment, water, and fauna were collected from the Firth of Clyde during September, 1971 to January, 1972 for analysis of heavy metals resulting from disposal of sewage sludge. Procedures for sample preparation are given. Ca, Cd, Cr, Cu, Fe, Mn, Ni, Pb, and Zn in sediments were determined by atomic absorption. Ag was determined by optical emission spectroscopy, and As, Mo, Sn, and V by colorimetry. Fauna were homogenized, and water was solvent extracted and preconcentrated for AA analysis. Only liver and muscle were analyzed from fish. Mercury in sediments was determined by cold-vapor AA after drying and acid digestion. Results show maximum ranges of Cu, Pb, and Zn to be confined to a relatively small area withing 2 km of the center of the dumping area. Hg showed a similar pattern with peak concentrations of 1820 ng/g at the center of the dumping site. Pb and Zn contents were also high at sites further up the Clyde; however, no evidence of large-scale transport was found. Organic carbon contents were 3-8 percent compared with background levels of 0.3-2.2 percent. Epifaunal species showed rather erratic variation in trace metal content, unrelated to total or readily extractable trace metals in the underlying sediment. The trace-metal content of demersal fish species was not significantly different from figures reported for elsewhere in the United Kingdom. The distributions of some in-faunal and epifaunal species in the area are described. It is concluded that the effects of sewage sludge disposal in this area are local, gross changes being limited to an area of about 20 sq km of sea-bed. However, little is known of the overall effects of toxic wastes particularly at threshold levels, and further monitoring is required. (Little-Battelle)

STABILITY AND REMOVAL OF COMMERCIAL DYES FROM PROCESS WASTEWATER,
Clemson Univ., S.C.
J. J. Porter.
Pollution Engineering, Vol 5, No 10, p 27-30, October 1973. 19 fig.

Descriptors: Stability, Environmental effects, *Aquatic environment, Waste water (Pollution), Natural streams, Reservoirs, Industrial wastes, Physical properties, Light, Waste water treatment, *Dyes, Color, Organic compounds, Degradation (Decomposition), Water pollution, Water temperature, Resistance, Gamma rays, Oxidation, Activated carbon, Hydrolysis, Reverse osmosis, Chemical precipitation.
Identifiers: Basic dyes, *Acid dyes, *Direct dyes, *Photodecomposition, *Textile industry, Pollutant removal, *Decolorization, Organic dyes, Degradation rates, Fate of pollutants, Degradation products, Chemical composition, Basic Violet 3, Basic Blue 9, Basic Green 1, Basic Green 4, Basic Red 2, Acid Red 1, Acid Violet 3, Acid Red 37, Acid Orange 10, Acid Black 52, Acid Blue 40, Direct Red 80, Direct Green 6, Direct Black 80, Direct Blue 76, Direct Red 83, Artifical light, Acid anthraquinone dyes, Acid azo dyes, Thiazine dyes.

A study has been made of the more common basic, acid, and direct dyes used by the textile industry in relation to their stability to light and water under conditions similar to those encountered when they are discharged to natural streams and reservoirs. All the basic dyes (triphenylmethane, phenazine and thiazine types) studied showed appreciable degradation during their 200-hr exposure to visible and ultraviolet light. Of the acid dyes studied, three showed drastic photoinduced degradation. The acid azo dyes were more fugitive to light than the acid anthraquinone dyes. The basic reason for degradation of acid dyes seems to be their suscep-

tibility to electrophilic attack. The data show that the direct dyes are more resistant to photodegradation than are the acid and basic dyes and that they would be stable and resist photochemical degradation in a treatment plant or receiving water. The data also show that the rate of degradation for direct dyes is at least 10 times as slow in natural daylight as in artifical light. Removal of dyes from waste water will depend on dye class and chemical composition. Color removal can be accomplished by activate carbon, a combined treatment of a chemical oxidant and gamma radiation, and lime precipitation. (Holoman-Battelle)

Descriptors: Distribution, *Heavy metals, *Mine wastes, *Water pollution sources, Copper, Zinc, Lead, Cadmium, Manganese, Chromium, Cobalt, Molybdenum, *Water analysis, Mining, Waste disposal, Industrial wastes, Hydrogen ion concentration, Hardness (Water), Water temperature, Dissolved oxygen, Alkalinity, Iron, Sulfates, Organic matter, *Mine water, Water pollution effects, Water quality, Path of pollutants, Magnesium.
Identifiers: Strontium, Barium, Poland, Background levels, River Biala Przemsza, Preconcentration, Atomic absorption spectrophotometry, Sample preparation.

Waters from channels, streams, and rivers in the area of lead and zinc mining (Boleslaw) were analyzed for Cu, Zn, Pb, Cd, Mn, Cr, Co, Mo, Sr, and Ba to investigate the contribution of these industries to metal concentrations in the water. Samples were collected in polyethylene bags and prepared for determination of microelements (except Sr) by evaporating and dissolving the residue in nitric acid. Determinations were made by atomic absorption spectroscopy. It was found that these industries contribute significant amounts of Zn, Pb, and Cd to the receiving waters, and these metals may be transported considerable distances. Lead content decreases the fastest and zinc content the slowest as the distance from the pollution source increases. The natural occurrence of lead and zinc ores in the deeper rock layers does not to any extent influence the surface waters with pH about 8.1 and with high total hardness. The increase in the content of zinc, lead, and cadmium in the water of the investigated water courses is mainly connected with the industrial pollution. The quantitative level of these three heavy metals shows a distinct tendency to increase in the autumn-winter season. The occurrence of calcium-dolomite rocks in the catchment basin of the investigated water courses is revealed in the chemism of the water by an exceptionally high content of magnesium and a low content of manganese and copper. A MASS BALANCE MODEL OF TRACE METALS IN SEVERAL DELAWARE WATERSHEDS,
Delaware Univ., Newark. Coll. of Marine Studies.
R. B. Biggs, J. C. Miller, M. J. Otley, and C. I. Shields.
Available from the National Information Service as PB-226 243 $3.00 in paper copy, $1.45 in microfiche. Technical Research Project Completion Report, November 1973, 47 p, 2 fig, 7 tab, 12 ref. OWRR A-018-DEL (2).

Descriptors: *Trace Elements, *Water chemistry, *Cadmium, *Lead, *Copper, *Mercury, *Rainfall, Chemisal precipitation, Fallout, Water pollution control, Water pollution sources, Water pollution, Atlantic coastal plain, *Delaware, Pollutant identification, Water quality standards.

Concentrations of copper, cadmium, lead, and mercury were measured in seven Delaware streams and in rainfall at four locations. Annual inputs of metal to watersheds from rainfall and outputs of metal dissolved in streams were calculated. High (exceeding U.S.P.H.S. drinking water standards) concentrations of cadmium and lead were evident in rainfall especially during the winter. Metal concentrations in streams never reached such high concentrations. In southern Delaware 90% of the cadmium and 70% of the copper that enters the watershed dissolved in rain is retained by the watershed or passes out associated with suspended particulate matter. In northern Delaware, 80% of the cadmium and all of the copper (on a mass balance) that enters watersheds dissolved in rain exits the watershed dissolved in the streams.

UPTAKE OF MERCURY BY FISH IN NATURAL AND ARTIFICIAL SYSTEMS,
New Mexico Inst. of Mining and Technology, Socorro. Dept. of Biochemistry.
D. H. Baker, III, C. J. Popp, and D. K. Brandvold.
In: State Water Plan, Proceedings of 18th Annual New Mexico Water Conference, April 5-6, 1973, Las Cruces: New Mexico State University Water Resources Research Institute Report No 026, p 40-49, July 1973. 4 fig, 7 tab, 7 ref.

Descriptors: *Water pollution sources, *Mercury, *New Mexico, Surface waters, Industrial wastes, Data collections, Water analysis, Fish, Correlation analysis, Laboratory tests, Analytical techniques.

Since New Mexico has a limited water supply, a mercury contamination problem could possibly exist on a local or state level. A small amount of mercury contamination could remove a large percentage of water from use. New Mexico at this time has a relatively mercury-free environment. The few manmade sources of mercury such as smelters and coal-burning powerplants may be too scattered and twoo small to cause any major mercury problems. Other industrial sources do not exist, and agricultural practices have not caused any documented contaminations in New Mexico's waters. Studies of mercury in natural waters throughout the State are in progress at the State Bureau of Mines. The preliminary results show that the levels of mercury are relatively low. Concentration of mercury by fish from natural waters was studied at the Bosque del Apache National Wildlife Refuge south of Socorro, New Mexico. These results are compared with data obtained from laboratory experiments of uptake by goldfish from low-level mercury concentration. (See also W74-02456) (Woodard-USGS)

EVALUATION OF NITRATE CONTENT OF GROUND WATER IN HALL COUNTY, NEBRASKA,
Illinois State Environmental Protection Agency, Springfield. Div. of Land Pollution Control.
R. Piskin.
Ground Water, Vol 11, No 6, p 4-13, November-December 1973. 4 fig, 8 tab, 9 ref.

Descriptors: *Nitrates, *Water pollution sources, *Groundwater, *Nebraska, Farm wastes, Fertilizers, Septic tanks, Sewage, Water table, Groundwater movement.
Identifiers: Hall County (Nebr).

Nitrate concentrations in groundwater are low (less than 10 mg per liter) in most parts of Hall County, Nebraska. Water from 46% of the sampled wells had nitrate concentrations greater than 10 mg per liter, and 13% had greater than 45 mg per liter. Sharp contrasts in concentrations occur within short distances. Seasonal changes and a progressive increase of nitrate concentrations occur in some observed wells. Concentrations decrease with increasing well depth and well penetration below the water table. Nitrate in groundwater is stratified where the concentration is high. Highest concentrations are found at or near the water table in the vicinity of sampled wells located close to a nitrate source. Potential sources of nitrate in the groundwater of Hall County are fertilizers, feedlots, septic tank effluents, seepage from the Wood River, precipitation, and soil fertility. Whereas seepage from the Wood River contributes nitrate to groundwater adjacent to the stream, seepage from the Platte River dilutes the nitrate content of groundwater. The hydraulic condutivity of the unsaturated zone is an important factor in controlling nitrate content of groundwater. (Knapp-USGS)

FATE OF PETROLEUM HYDROCARBONS IN BEACH SAND,
Naval Biomedical Research Lab., Oakland, Calif.
H. E. Guard, and A. B. Cobet.
Available from NTIS, Springfield, Va. 22151 as AD-758 740, Price $3.00 printed copy; $1.45 microfiche. Final Contract report, 1972. 89 p, 39 fig, 29 tab, 20 ref. USCG Contract CG-13, 337. ONR N00014-69-A-0200-1001.

Descriptors: *Oil pollution, *Beaches, *Sands, *California, *Organic compounds, Oil spills, Biodegradation, Chemical reactions, Data collections, Soil microbiology, Bacteria, Pollutant identification, Environmental effects, Ecology, Evaporation, Lysimeters.
Identifiers: *San Francisco area (Calif).

Studies at four sampling locations on three beaches in the San Francisco area affected by oil from an 840,000 gal spill of Chevron bunker fuel have shown that the size of the bacterial population and distribution of bacterial genera within the beach were unaffected by the petroleum hydrocarbons remaining in the beach sand after completion of the cleanup operation. Only 15% of the beach bacteria were affected by a variety of petroleum components including the pentane soluble fraction of the bunker fuel. Abnormally high concentrations of chloroform extractable material with considerable variation were observed at two sampling locations following the spill. Log-normal distribution analysis of the concentration of the chloroform extractable material indicates that the sampling locations on the San Francisco Bay have higher background levels (5% limit concentrations) of chloroform extractable material than the beaches on the ocean. Laboratory experiments indicated that the lower molecular weight components of bunker fuel dispersed in a beach will be removed by evaporation, dissolution and biodegradation acting in concert. (Woodard-USGS)

SELECTED REFERENCES, GROUND-WATER CONTAMINATION, THE UNITED STATES OF AMERICA AND PUERTO RICO.
Geological Survey, Washington, D.C. Water Resources Div.

Open-file report, 1973. 103 p.

Descriptors: *Bibliographies, *Water pollution sources, *Groundwater, *United States, *Puerto Rico, Information retrieval, Publications, Water quality, Groundwater resources, Pollutant identification, Path of pollutants, Water pollution effects, Water pollution control, Environmental effects, Surface-groundwater relationships.

In 1972 the U.S. Geological Survey, Water Resources Division, made a reconnaissance study of the location and severity of groundwater contamination throughout the 50 States and Puerto Rico. During the course of that study a substantial list of references pertaining to groundwater contamination was obtained. The references are listed alphabetically and are also indexed according to geographic areas, States, kinds of contamination, sources of contamination, and general discussions. (Woodard-USGS)

ON THE CHARACTERISTICS OF SALT INTRUSION IN THE KITAKAMI RIVER, MIYAGI PREFECTURE (IN JAPANESE),
Japanese Society of Limnology, Otsu (Japan).
Y. Tontani.
Jap J Limnol, Vol 33, No 1, p 1-5, 1972. Illus. English summary.
Identifiers: *Japan (Kitakami River), Rivers, *Salt water intrusion, *Salinity, Water temperature, Velocity.

During the period 1965-1968, determinations were made of salinity, temperature and velocity in the Kitakami River (Japan). The salinity concentration of the bottom layer is much higher than the surface layer at the lower end of the river. Consequently, the water of the surface layer is fresh water and that of the bottom layer is salt water. The salt wedge type of the Kitakami River shows fine negligible mixing. This phenomenon is rare, because in the rivers emptying into the Pacific Ocean, it is generally moderate mixing. The salt wedge type is caused by the level difference between the low water and the higher water, but it is also caused by discharge. The salt wedge length was affected by an influence of discharge. When discharge decreases to about 70 m3/sec, the salt water intrudes into upper stream, about 8 km from river mouth. But, when discharge increases to about 400 m3/sec, the salt water is restricted to the vicinity of the river mouth.--Copyright 1973, Biological Abstracts, Inc.

HYGIENIC CONDITIONS IN THE PROCUREMENT OF DRINKING WATER FROM INDIVIDUAL SOURCES (IN GERMAN),
J. Preuner Von Prittwitz.
Zentralbl Bakteriol Parasitenkd Infektionskr Hyg Erste Abt Orig Reihe B Hyg Praev Med, Vol 155, No 5, p 374-383, 1972, English summary.
Identifiers: *Bacteria, *Hygienic conditions, *Potable water, Water wells, Water sources.

Wells, when used as a source of drinking water, constitute a direct danger from the hygienic and bacteriological aspects for the persons who are supplied with this drinking water. An urgent demand is made for the revision of the regulations concerning the sinking of wells, in order that the digging of wells shall be prohibited in general, even if it is carried out by firms specializing in this work. In addition, the public authorities (Health Department, Police, Hygiene Institute, Parish and Rural District Councils) should endeavor to replace existing wells with supplies of pure drinking water, if such water can be obtained or delivered, even if this is accompanied by higher costs.--Copyright 1973, Biological Abstracts, Inc.

INFLUENCE OF HERBICIDES ON MICROBIOLOGICAL CONDITIONS,
Komenskeho Universita, Bratislava (Czechoslovakia). Dept. of Microbiology.
A. Dubovska.
Acta Fac Rerum Nat Univ Comenianae Microbiol. 1. p 53-65, 1971, Illus.
Identifiers: *Atrazine, *Azotobacter, Fungi, *Herbicides, Microbiological conditions, Organic matter, *Simazine, Soil moisture, Microorganisms.

Seasonal changes of the groups of microorganisms depended predominantly on soil moisture and the amount of organic material in the soil. Simazine and atrazine, added to the soil at the rate of 80-1000 ppm, stimulated N fixation by Azotobacter in laboratory experiments, but not in field trials. Simazine and atrazine exerted the strongest inhibition on the quantity and dynamics of fungi. The influence of these herbicides, both on ammonia-forming microorganisms and on pectinolytic and aerobic cellulolytic microorganisms differed according to ecological factors. Azotobacter was slightly susceptible to the herbicides in the doses used.--Copyright 1973, Biological Abstracts, Inc.

A REPORT ON BACTERIAL POLLUTION AFFECTING SHELLFISH HARVESTING IN NEWPORT RIVER, NORTH CAROLINA.
Environmental Protection Agency, Athens, Ga. Surveillance and Analysis Div.

Available from NTIS, Springfield, Va. 22151 as PB-215 291. Price $3.00 printed copy; $1.45 microfiche. Region IV Report, April 1972. 43 p, 9 fig, 10 tab, 11 ref, 2 append.

Descriptors: *Water pollution sources, *Bacteria, *Estuaries, *North Carolina, Environmental effects, Shellfish, Coliforms, Sewage effluents, Septic tanks, Animal wastes (Wildlife), Fertilizers, Sampling, Tributaries, Tidal effects, Salinity, Data collections, Evaluation, Path of pollutants, Water pollution effects.
Identifiers: *Newport River (NC).

Portions of the Newport River in North Carolina have been closed to shellfish harvesting since 1969 due to excessive levels of coliform bacteria in the growing waters. Closure of the area to shellfish harvesting coincided with a by-pass of untreated domestic wastes from the town of Newport. During the December 1971 study period, excessive coliform levels in the shellfish growing areas of the Newport River were not attributable to waste discharges from the Newport sewage treatment plant or the West Cateret High School waste treatment facility. The majority of the coliform population contributed to the upper Newport River estuary is introduced from tributary streams and sources incidental to the river shore. Of the tributaries sampled above 'The Narrows,' Deep Creek and Hull Swamp contribute the largest number of coliforms. Wildlife common to these areas, together with agricultural runoff, serve as major sources of coliform contamination within the watershed. The concentration of septic tanks in the unincorporated areas of the watershed, especially those installed in areas unsuited for adequate operation, have the potential for contributing bacterial pollution to the Newport River and tributary streams. (Woodard-USGS)

pollution control, Pollution abatement, Municipal wastes, Industrial wastes, Sewage effluents, Water analysis, Nutrients, Trace elements.
Identifiers: *Tampa Bay area (Fla).

The Tampa Bay Regional Planning Council is formulating a waste-water treatment plan for the greater Tampa Bay area in cooperation with the Environmental Protection Agency. The area covered by this plan includes Hillsborough, Manatee, Pasco, Pinellas, and Sarasota Counties, Florida. In October 1972, the Planning Council entered into a cooperative agreement with the U.S. Geological Survey to collect and analyze water samples from streams, industrial plants, sewage treatment plants, and their receiving waters. The analyses are to be used in the Planning Council's modeling effort and as benchmark information on water-quality conditions in the greater Tampa Bay area. This report makes available the water-quality data collected as a part of this study and also the data obtained in the cooperative programs between the Geological Survey and other agencies, such as the Southwest Florida Water Management District. Data on water quality at nine stream sites with records as much as 19 years are also included. (Woodard-USGS)

5C. Effects of Pollution

THE EFFECTS OF ACID MINE WATER ON GROWTH (NUMBER AND SIZE) OF CHLORELIA VULGARIS,
West Virginia Univ., Morgantown. Dept. of Biology.
W. A. Janeczek, E. C. Keller, III, W. J. Shoupp, and E. C. Keller, Jr.
Proceedings of the West Virginia Academy of Science, Vol 44, No 1, p 40-49, April, 1972. 6 fig, 1 tab, 8 ref.

Descriptors: *Algae, *Acid mine water, *Chlorella, Water pollution, Water pollution effects, Water quality, *Chlorphyta, *Growth rates, Size, Growth stages, Cultures, Ecosystems.

Growth in Chlorella vulgaris was examined under axenic conditions in a variety of acid mine water (AMW) concentrations, and inorganic nutrient media, to ascertain the relationship between cell number and cell size. High concentration of AMW (above 3/16) decreased the average cell size. At concentrations of 3/16 AMW or more, cell number was greatly decreased. The normal relationship that exists between cell size and cell number during growth was greatly modified by AMW concentrations greater than 3/16. (See also W74-02169)
W74-02168

THE GROWTH OF CHLORELLA VULGARIS IN SEWAGE AND ACID MINE WATER,
West Virginia Univ., Morgantown. Dept. of Biology.
W. F. Skinner, and E. C. Keller, Jr.
Proceedings of the West Virginia Academy of Science, Vol 44, No 1, p 49-56, April, 1972. 4 fig, 6 ref.

Descriptors: *Algae, *Acid mine water, *Chlorella, Water pollution, Water pollution effects, Water quality, *Chlorphyta, *Growth rates, Growth stages, Cultures, Ecosystems, *Sewage.

Preliminary research has been conducted to determine the effects of sewage, acid mine water (AMW), and their interaction on the growth of the unicellular green alga Chlorella vulgaris Beijerink (Pratt strain). The nutrient media were composed of sterile synthetic sewage and/or acid mine water diluted to the desired concentrations with a standard inorganic culture medium (modified Beijerinck's medium). Six concentrations of sewage (0/0, 1/32, 1/16, 1/8, 1/4, 1/2), four concentrations of AMW (0/0, 1/31, 1/16, 1/8), alone and in all possible combinations were evaluated. The cultures were grown at 25C in 24x150 mm glass culture tubes, aerated, and agitated with sterile humidified air, and illuminated from below by approximately 500 f.c. light intensity by 'Gro-lux' fluorescent tubes. The maximum growth was obtained with the 1/2 sewage treatment, the least amount of growth occurred in the 1/8 AMW + 1/2 sewage treatment. Chlorella vulgaris was apparently able to utilize some of the components in the sewage since better growth occurred in all treatments containing only sewage than in the controls. However, high concentrations of sewage in combination with high concentrations of AMW inhibited algal growth. (See also W74-02168)

SOME CHARACTERISTICS OF CESIUM-137 ACCUMULATION IN POPULATIONS OF FRESHWATER FISH, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Inst. of Evolutionary Morphology and Animal Ecology.
A. I. Il'enko.
Vopr Ikhtiol. Vol 12, No 1, p 174-178. 1972. Illus.
Identifiers: *Cesium-137, Fish (Fresh water), Muscle, *Pike, Fish populations, *Roach, Water pollution effects.

The experiments were performed in a water reservoir with an artificially changing Cs-137 source. The seasonal changes in concentration of the isotope in the muscle of roach and pike, in food, and water were determined. The concentration of the isotope in the food and of roach muscle in the roach reflected its concentration in the water. However the same was not true for the pike: the concentration in the muscles did not correspond to the concentration in the water.--Copyright 1973, Biological Abstracts, Inc.

ACCUMULATION OF STRONTIUM AND CALCIUM IN FRESHWATER FISHES OF JAPAN,
National Inst. of Radiological Sciences, Chiba (Japan). Dept. of Environmental Contamination.
Y. Suzuki, R. Nakamura, and T. Ueda.
J Radiat Res. Vol 13, No 4, p 199-207. 1972. Illus.
Identifiers: Bone, *Calcium, *Carp, Fallout, Fish (Freshwater), *Gibel, Japan, *Strontium-90, Water pollution effects.

The 90Sr contents in bones of freshwater fishes (carp and gibel) from radioactive fallouts were investigated in relation to those in the surrounding waters from 1963-1970. The specific activities (90Sr/Sr) of fish bones and of the surrounding waters declined rapidly from 1963-1964, followed by a gradual decline from 1964-1970. The specific activities of fish bones were always slightly higher than those of the waters, except that of gibel in 1963. The time lag between Sr specific activities of fish bones and those of surrounding waters were 270 days for carp and 360 days for gibel. The discrimination between stable Sr and Ca in freshwater fishes was demonstrated: in the field studies, the Sr-Ca observed ratio (OR) were determined as 0.74 plus or minus -.05 for carp and 0.84 plus or minus 0.07 for gibel respectively. In rearing experiments, the Sr accumulation of carp reared in the water of 2 x 10-1 mg Ca/l. It is possible to estimate 90Sr content in the bones of carp and gibel by using their OR values and the time lag of Sr specific activity between the freshwater fish bone and the surrounding water.--Copyright 1973, Biological Abstracts, Inc.

AN ECOLOGICAL EVALUATION OF STREAM EUTROPHICATION,
Michigan State Univ., East Lansing. Inst. of Water Research.
R. C. Ball, and N. R. Kevern.
Available from NTIS as PB-226 140 $6.50 in paper copy, $1.45 in microfiche. OWRR-3381 (No 3723) (9), C-2205 (No 3386) (5), and C-1663 (No 3153 (7). Project Completion Report, July 1973. 253 p, 69 fig.

Descriptors: Brown trout, Sculpin, Toxicity, *Eutrophication, Water quality, Discharge (Water), *Macrophytes, *Phosphorus, Nitrogen, *Periphyton, *Invertebrates, *Benthos, Artificial substrates, Fish populations, Drift, Metabolism, Chlorinated hydrocarbons, Pesticides, Social aspects, Recreation, *Michigan.

Identifiers: Jordan River (Mich), Au Sable River (Mich), Red Cedar River (Mich), National Fish Hatchery.

Three streams, varying in degree of disturbance by man, were selected for study; ranging from pristine to heavily disturbed. The aims of the study were to develop indices for predicting changes in streams as they are subjected to increasing eutrophication, to obtain baseline data that relates stream characteristics to water quality, to evaluate the effects of urbanization on stream stability and to measure the aesthetic and recreational values of streams. Diurnal patterns in dissolved oxygen concentration were highly correlated with known nutrient loadings and trophic condition. As human disturbance increases, fluctuations of stream discharge around the annual mean also increases. Phosphorus content within macrophyte tissues reflected water concentrations, while nitrogen content was related to phosphorus content. Macrophyte standing crop was influenced more by stream morphology than by level of enrichment. As the nutrient loadings increased, deviation of standing crop also increased. The estimation of periphyton production rates via artificial substrata holds promise as a technique for the detection of nutrient rich inputs to streams. Examination of species associations indicated several taxonomic groups of diatoms which appear to be related to water quality. The species diversity of benthic macroinvertebrates was well correlated with level of disturbance. High diversity indices were related to high water quality. Studies of the trout populations in two rivers indicate that there are fewer and larger fish at the more eutrophic sites. Increasing eutrophication is most evident in the growth rate of young-of-the-year fish. (See also W74-02202 thru W74-02204)

SOME LIMNOLOGICAL REMARKS ON LAKE SAIZUCHI-NUMA, YAMAGATA PREFECTURE, (IN JAPANESE),
Yamagata Univ. (Japan). Lab. of Science Education.
H. Kaito.
Jap J Limnol. Vol 33, No 1, p 6-10. 1972. Illus. (English summary).
Identifiers: Chemical stratification, *Japan (Lake Saizuchi-Numa), Lakes, Limnological studies, *Lake stratification, Thermal stratification, *Anaerobic condition.

Lake Saizuchi-numa, situated on the boundary of Mogami and Kitamurayama districts in Yamagata Prefecture (Japan) is considered to be a type of the tectonic lakes from the geological point of view. At the summer stagnation period, thermal as well as chemical stratifications are observed and the anaerobic layer develops near the bottom. The annual observation reveals that the main constituent of the dissolved substances in NaCl which is transported by snow from Japan Sea in winter time. Throughout this season, the sea-breezed salt by monsoon is accumulated in fallen snow which will melt and furnish this lake. This lake is dystrophic.--Copyright 1973, Biological Abstracts, Inc.

COMPUTER SIMULATION OF TROPHIC LEVEL INTERRELATIONSHIPS IN CAYUGA LAKE,
Cornell Univ., Ithaca, N.Y.
R. Plant, R. Lance, and W. Youngs.
Available from the National Technical Information Service as PB-226 105, $3.00 in paper copy, $1.45 in microfiche. Cornell University Water Resources and Marine Sciences Center, Technical Report No. 69, August 1973. 26 p, 9 fig, 3 tab. OWRR A-040-NY (1). 14-31-0001-3832.

Descriptors: *Computer models, Model studies, *Food chains, *Trophic level, Lakes, Lake trout, Phytoplankton, Zooplankton, *New York, *Simulation analysis.
Identifiers: *Cayuga Lake (New York).

An attempt is described to simulate a particular trophic chain in Cayuga Lake. The chain, consisting of phytoplankton, zooplankton, alewives and lake trout, was selected primarily because it is largely independent of other inhabitants of the lake, and represents a complete food chain running from primary producer to final predator. The primary objectives were: (1) to formulate a model displaying a behavior similar to that observed in the species populations in the trophic chain; (2) to test the behavior of this model under variation of its parameters; and (3) to use the model as a guide in developing programs for future research, both theoretical and in the field. As such it was necessary to base the model on theory sufficiently detailed to provide useful information but not so complex as to be mathematically intractable. Based on the field data available, it was decided that the most suitable model was one based on the classical Lotka-Volterra equations (Lotka, 1925). These are a system of interrelated non-linear first order differential equations in which each relevant parameter is represented as a single time dependent variable; while the closed form solution of this system cannot be written explicitly, its behavior has been thoroughly studied (Davis, 1961).

EXPERIMENTAL STUDIES ON PHYTOPLANKTON SUCCESSION IN CAYUGA LAKE,
Cornell Univ., Ithaca, N.Y.
B. J. Peterson, A. E. Savage, and J. P. Barlow.
Available from the National Technical Information Service as PB-226 068, $3.00 in paper copy, $1.45 in microfiche. Cornell University Water Resources and Marine Sciences Center, Technical Report No. 71, 1973. 23 p, 7 fig, 3 tab, 37 ref. OWRR A-035-NY (1). 14-31-0001-3532.

Descriptors: *Phytoplankton, *Succession, Lakes, *Carbon, *Phosphorus, *Nutrients, *New York.
Identifiers: *Cayuga Lake (New York).

Natural phytoplankton assemblages from Cayuga Lake were maintained under controlled nutrient conditions in large volume continuous flow laboratory cultures. Changes in the C:P ratio, rate of carbon uptake per unit carbon, and species composition were followed in nutrient limited chemostats and nutrient sufficient turbidostats. Rates of change of relative abundance and final values for the C:P ratio and rates of carbon uptake per unit carbon are related to parameters describing the lake populations. These comparisons suggest that Cayuga Lake phytoplankton are limited by phosphorus but are rarely phosphorus deficient.
W74-02217

ATTEMPT AT MOLLUSK CONTROL BY INCREASING THE PLANKTONIC BIOMASS AND BY MOLLUSCICIDAL TREATMENT: THE UREA-N-TRITYLMORPHOLINE ASSOCIATION (IN FRENCH),
Institut Tropical Suisse, Basel.
P. Perret, M. Egger, and A. A. Degremont.
Acta Trop, Vol 29, No 2, p 175-181, 1972, English summary.
Identifiers: *Biomass (Plankton), Breeding, Bulinus-sp, *Molluscicidal treatment, *Mollusk control, Schistosoma-haematobium, *Snails, *Urea.

An antisnail molluscicide treatment is described which is based on the simultaneous application of urea and the molluscicide N-tritylmorpholine. When diluted with water the endothermic reaction of urea causes sufficient movement to thoroughly disperse the molluscicide. As a nutritive substance, urea increases the biomass of plankton in such quantity that snail breeding seems to be inhibited. The experiment was done in a reservoir pool which throughout the year contained molluscs of the genus Bulinus, the natural host of Schistosoma haematobium. Earlier attempts to keep the pool free of Bulinus sp. necessitated bimonthly treatment with molluscicides. After the combined application of urea and N-trityl-morpholine the snails were completely absent during a period of 5 mo.--Copyright 1973, Biological Abstracts, Inc.

RELATION OF MINERAL AND HORMONE METABOLISM TO INTAKE OF WATER WITH A HIGH NATURAL CONTENT OF FLUORIDE,
L.L.R.M. Medical Coll., Meerut (India). Dept. of Pathology.
G. K. Tiagi, S. P. S. Teotia, and M. Teotia.
Fluoride. Vol 5, No 4, p 213-219. 1972.
Identifiers: *Fluride, Hormones, *Metabolism (Human), Minerals, *Potable water, Public health, *Calcium absorption.

The metabolic effects of intake of low and high natural fluoride water were studied on 8 subjects over a period of 180 days. In the 4 subjects drinking high fluoride water (10.35 ppm) there was a definite increase in the intestinal absorption of Ca, gradual rise in plasma alkaline phosphatase, and increased retention of Ca as revealed by balance studies. Plasma, Ca, P, Mg, PBI (protein bound iodine), plasma-cortisol and urinary steroids showed no significant change. In the 4 subjects drinking low fluoride water (0.5 ppm) no changes were produced.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF SUPERNATANT FLUID OF THE ANKISTRO-DESMUS BRAUNII BRUNNTH CULTURE ON DEVELOPMENT OF ALGAE IN WASTE WATERS OF THE CHERNIGOV CHEMICAL FIBER INDUSTRIAL GROUP, (IN UKRAINIAN),
Akademiya Nauk URSR, Kiev. Instytut Botaniki.
H. M. Palamar-Mordvyntseva, and V. V. Stupyna.
Ukr Bot Zh. Vol 29, No 3, p 294-299. 1972. (English summary).
Identifiers: Algae, *Ankistrodesmus-Braunii, *Chemical fiber wastes, Chlamydomonas, Chlorella, Culture, Development, Industrial wastes, Pinnularia, Scenedesmus, Stimulant, *Supernatant fluid, *USSR, Chernigov, Waste waters.

The effect of supernatant fluid of the A. braunii culture on development of algae in waste waters of the Chernigov (USSR) group of chemical fiber enterprises was studied under laboratory conditions. The alga under study apparently excretes into the environment peculiar, physiologically active substances which in small doses stimulate development of wild species of Chlorella, Scenedesmus, Pinnularia and Chlamydomonas. The stimulating and inhibiting effect of the supernatant fluid of the Ankistrodesmus culture is established to depend on the supernatant fluid dose introduced into the medium and Ankistrodesmus growth conditions (age and nutrient conditions of the culture).--Copyright 1973, Biological Abstracts, Inc.

MEASURING STRESS IN FISH EXPOSED TO PULP MILL EFFLUENTS,
British Colombia Research Council, Vancouver.
T. E. Howard, and C. C. Walden.
In: TAPPI Environmental Conference, San Francisco, May 14-16, 1973. Preprinted Proceedings TAPPI, Atlanta, Ga., p 15-18, 2 tab, 2 fig, 20 ref.

Descriptors: *Bioassay, *Pulp wastes, *Fish physiology, *Toxicity, *Water pollution effects, *Analytical techniques, Industrial wastes, Pollutants, Fish, Respiration, Thermal pollution, Temperature, Pollutant identification.
Identifiers: Sublethal pollution effects, Short-term bioassay, Kraft mills.

Field bioassays of effluent effects on aquatic organisms are costly, time-consuming, and retrospective. Therefore, short-term bioassay techniques have been developed to evaluate responses of fish to pollution loads at sublethal concentrations, as reflected by changes in respiration, swimming ability, temperature tolerance, and blood chemistry. Examples of such short-term bioassays, applied to the evaluation of kraft mill effluent toxicity, are presented. These methods are regarded as complementary to, rather than competitive with, long-term investigations or detailed ecological studies. (See also W74-02273) (Brown-IPC)

LABORATORY AND CONTROLLED EXPERIMENTAL STREAM STUDIES OF THE EFFECTS OF KRAFT EFFLUENTS ON GROWTH AND PRODUCTION OF SALMONID FISH,
Oregon State Univ., Corvallis.
C. E. Warren, W. K. Seim, R. O. Blosser, A. L. Caron, and E. L. Owens.
In: TAPPI Environmental Conference, San Francisco, May 14-16, 1973. Preprinted Proceedings TAPPI, Atlanta, Ga., p 19-26, 10 fig, 18 ref.

Descriptors: *Toxicity, *Pulp wastes, *Fish, *Water pollution effects, Salmon, Trout, Aquaria, Biochemical oxygen demand, Aquatic organisms, Algae, Insects, Effluents, Industrial wastes, Pulp and paper industry.
Identifiers: Kraft mills.

Based on results of a six-year study, neither primary- nor secondary-treated kraft mill effluents impaired the growth of salmonid fish (coho and Chinook salmons, and brown and cutthroat trouts) in aquaria at BOD concentrations below 0.5 g/liter, but did affect the fish at higher concentrations. In laboratory stream communities and experimental stream channels, these effluents had no deleterious effects on salmonid growth and biomass production at BOD concentrations of 0.5 mg/liter, but did change the composition of the benthic community of algae and insects. At the same BOD concentrations, effluents from another kraft mill exerted less effect on aquarial salmonids than those from the first mill studied. (See also W74-02273) (Brown-IPC)
W74-02277

EFFECT OF IRRIGATION, FERTILIZATION, AND OTHER CULTURAL PRACTICES ON WATER QUALITY,
Idaho Univ., Moscow. Water Resources Research Inst.
D. V. Naylor, and J. R. Busch.
Available from the National Technical Information Service as PB-226 113, $3.00 in paper copy, $1.45 in microfiche. Completion Report, September 1973. 19 p, 1 fig, 3 ref. OWRR A-036-IDA (1). 14-01-001-3512.

Descriptors: *Furrow irrigation, Surface runoff, Groundwater, *Nutrients, Solids, Computer models, Water balance, Sugar beets, Beans, Onions, Nitrogen, *Fertilizers, Sediments, *Idaho, Water quality, Computer programs, Phosphorus, Sedimentation basins (Waste disposal).
Identifiers: *Boise Valley (Idaho), Sediment ponds.

A farming unit in an intensively cropped, furrow irrigated agricultural area of the Boise Valley in southwestern Idaho was instrumented for two cropping seasons to measure the quantities of water entering and leaving the area. Surface and groundwater samples taken from the unit were analyzed for nutrient and solids content. A computer program was developed and used to compute a nutrient, total solids and water budget for the unit based on water measurements, climatic measurements, cropping data and chemical analyses. Excessive amounts of water applied to onion crops were responsible for a portion of the applied water entering the groundwater through deep percolation carrying with it part of the nitrogen applied as fertilizer. However, the other crops, sugar beets and beans, were found to use shallow groundwater for part of their consumptive use requirements. The only materials which were lost from the farm in appreciable quantities in the surface runoff were total solids and the associated phosphorous except when nitrogen was added to the irrigation water as fertilizer. Sediment ponds installed on the farm were found to be effective in removing sediments and phosphorous from the surface runoff.

A TECHNIQUE FOR EVALUATING ALGAL GROWTH POTENTIAL IN ILLINOIS SURFACE WATERS,
Illinois State Water Survey, Urbana.
W. C. Wang, W. T. Sullivan, and R. L. Evans.
Report of Investigation 72, 1973. 16 p, 21 fig, 10 tab, 37 ref.

Descriptors: *Algae, *Eutrophication, *Analytical techniques, *Illinois, Analysis, Fluorescence, Spectophotomery, Alkalinity, Hardness (Water), Laboratory tests. Testing procedures, Pollutant identification, Biomass.
Identifiers: *Algal growth potential.

Various techniques were used to measure the algal growth potential (AGP) of Illinois surface waters. The AGP is defined as the algal or organic mass resulting from a 7-day incubation of a culture grown on a natural water substrate under standardized laboratory conditions and expressed as milligrams of dry organic matter per liter of sample. This definition resulted from the measurement of algal growth in 155 samples from 3 lakes, 4 streams and 2 sewage sources. The process involves measuring changes of light absorption, fluorescence of algal pigments, filterable organic and inorganic mass, total alkalinity, and hardness. Analysis showed filterable organic mass to be the most reliable criterion for quantifying algal growth. The AGP of water and sewage samples were found to vary from between 12 mg/l for water from Lake Eureka to 120 mg/l for raw sewage and 135 mg/l for water from a tertiary effluent sewage pond. The development of the AGP parameter will provide a new diagnostic tool for planning and managing water resources, as it indicates the potential for eutrophication, although the relationship of the AGP and observed nutrient levels is uncertain at present. ACCUMULATION OF FOSSIL CO2 IN THE ATMOSPHERE AND THE SEA,
Institute of Nuclear Sciences, Lower Hutt (New Zealand).
A. W. Fairhall.
Nature, Vol 245, No 5419, p 20-23, September 7, 1973. 4 fig, 15 ref.

Descriptors: *Mathematical models, *Carbon dioxide, *Water pollution effects, *Mollusks, *Calcium carbonate, *Sea water, *Fossil fuels, Equations, Oceans, Reefs, Path of pollutants, Air pollution effects, Forecasting, Corals.

A model showing the relationship between the accumulation of CO2 in the atmosphere from fossil fuels and the levels in the sea predicts that the rapid increase in atmospheric CO2 will cause the sea to become undersaturated in CaCO3. The possible result of this undersaturation is that coral reefs and shells of organisms would tend to dissolve. The model is based on the premise that the long lived terrestrial biosphere and humus are not significant sinks for fossil CO2 emissions. The predictions of the model remain to be validated and the effect of undersaturation of CaCO3 on calcareous organisms is not presently known. (Little-Battelle)

FREQUENCY OF FISH TUMORS FOUND IN A POLLUTED WATERSHED AS COMPARED TO NONPOLLUTED CANADIAN WATERS,
Chicago Medical School, Ill. Dept. of Microbiology.
E. R. Brown, J. J. Hazdra, L. Keith, I. Greenspan, and J. B. G. Kwapinski.
Cancer Res, Vol 33, No 2, p 189-198, 1973, Illus.
Identifiers: Arsenic, Bacteria, Benzanthracene, *Illinois (Fox River), Carbons, Carcinogens, Chlorinated hydrocarbons, Coliform, Crude oil, *Fish tumors, Gasoline, Hydro, Lead, Mercury, Nonpolluted waters, Phosphates, Polluted waters, Rivers, Sulfates, Toluene, Tumors, Watersheds.

Data are presented on the incidence of tumors found in 2121 fish examined from the Fox River watershed (4.38%) as compared to 4939 fish examined in Canada (1.03%). The water systems were compared as to pollution potentials, and the Fox River was found to be a highly polluted system. Among the pollutants found were Hg, Pb, As, toluene, crude oil, gasoline, benzanthracene, chlorinated hydrocarbons, phosphates, sulfates and coliform bacteria. Factors such as dissolved O2 content, temperature and nutritional variation were considered similar in both water systems. It is concluded that these pollutants were responsible for the greater frequency of tumors. No attempts were made to determine the effects of pollution of the long term human users of the water or to determine the virus contents of the water system under study.--Copyright 1973, Biological Abstracts, Inc.

CHLORINATION EFFECTS ON ORGANIC CONSTITUENTS IN EFFLUENTS FROM DOMESTIC SANITARY SEWAGE TREATMENT PLANTS,
Oak Ridge National Lab., Tenn.
R. L. Jolley.
Report No ORNL-TM-4290, October 1973. 342 p, 29 fig, 52 tab, 396 ref, 7 append. W-7405-eng-26.

Descriptors: *Chlorination, *Organic compounds, *Radioactivity techniques, *Sewage treatment, Sewage effluents, *Domestic wastes, Chlorine, Methodology, Environmental effects, Sampling, Chemical reactions, Anion exchange, Aqueous solutions, Separation techniques, Laboratory tests, Laboratory equipment, Cation exchange, Tracers, Organic acids, Phenols, Waste treatment, Pollutant identification, Chemical analysis, Surveys.
Identifiers: *Ion exchange chromatography, *Chlorinated hydrocarbons, Synthetic sewage effluents, Chlorine residual, Characterization, Chemical concentration, Sample preparation, Cl-36, Chloramines, 2-Chlorobenzoic acid, 3-Chlorobenzoic acid, 4-Chlorobenzoic acid, 8-Chlorocaffeine, 6-Chloroguanine, 3-Chloro-4-hydroxybenzoic acid, 4-Chloromandelic acid, 4-Chloro-3-methylphenol, 2-Chlorophenol, 3-Chlorophenol, 4-Chlorophenol, 4-Chloropheylacetic acid, 4-Chlororesorcinol, 5-Chlorosalicylic acid, 5-Chlorouracil, 5-Chlorouridine, 8-Chloroxanthine, Dichloramine, Hypochlorite.

The major objectives were to develop a method for examining chlorination effects and to determine whether, as well as to what extent chlorine-containing organic compounds are formed when effluents from domestic sanitary sewage treatment plants are chlorinated at milligram-per-liter chlorine concentrations. An additional purpose was to characterize, or identify, and quantify stable chlorine-containing and other organic compounds in chlorinated and unchlorinated effluents. Chlorination yields were approximately the same for both primary and secondary effluents. Essentially the same effects were obtained by chlorination with either chlorine gas or hypochlorite solution. The effects of chlorination in the chlorinated effluents were determined by a method which coupled chlorination by Cl-36 radioactive tracer with separation by high-resolution anion-exchange chromatography using sensitive radioactive tracer monitoring. It was determined that chlorine-containing stable organic constituents are present after chlorination of effluents from domestic sanitary sewage treatment plants. Over 50 chlorine-containing constituents were separated from chlorinated secondary effluents. Seventeen of these chlorine-containing organic compounds were tentatively identified and quantified at the 0.5- to 4.3- microgram/liter level. In addition to the 17 chlorine-containing compounds that were identified, 32 stable organic constituents were identified and 23 of these were quantified at 2- to 190-microgram/liter levels in the effluents from domestic sanitary primary sewage treatment plants. Nine stable organic constituents were identified, and eight of these were quantified at 5- to 90-microgram/liter levels in the effluents from domestic sanitary secondary sewage treatment plants. TOXAPHENE ACCUMULATION IN FISH IN LAKES TREATED FOR ROUGH FISH CONTROL,
Wisconsin Univ., Madison.
R. A. Hughes, and G. F. Lee.
Environmental Science and Technology, Vol 7, No 10, p 934-939, October 1973. 4 fig, 2 tab, 26 ref.

Descriptors: *Pesticide residues, *Pesticide toxicity, Pesticide kinetics, *Pollutant identification, *Water pollution effects, Chemical analysis, Persistence, Water analysis, Water properties, Chlorinated hydrocarbon pesticides, Plankton, Fish stocking, Freshwater fish, Absorption, Rough fish, Physical properties, Chemical properties, Sunfishes, Path of pollutants, Walleye, Weight.
Identifiers: *Bioaccumulation, *Toxaphene, Fate of pollutants, Fat tissue, Sample preparation, Animal tissues, Electron capture gas chromatography, Thin layer chromatography, Fox Lake, Comstock Lake, Ottman Lake, Kusel Lake, Green sunfish, Biological magnification.

The results are presented of a study which covered the decline of toxaphene in treated lakes; the extent of toxaphene residue uptake by stocked fish; and the toxicity of 'aged' toxaphene residues compared to that of the standard mixture. Previously described methods for extracting, cleaning up and estimating toxaphene residues in aquatic samples were used. Electron capture gas chromatography was used to identify the pesticide and its presence in samples was confirmed by thin-layer chromatography. Fish, stocked in lakes retaining in the water very small amounts of toxaphene and plankton, accumulated residual toxaphene while maintaining excellent growth and reproducing successfully. Both stocked and hatched bluegills eliminated accumulated residues while maintaining excellent growth. Edible flesh of bluegills contained less than 10 percent of the whole body burden of toxaphene residues, and substantial portions of residues were removed by pan frying. Significant correlations were noted between accumulated toxaphene residue and fat content of stocked bluegills. Toxaphene and toxaphene residue accumulation were more closely related to fat content than to fish weight. Bluegills killed in lake treatment projects accumulated concentrations of toxaphene lower than concentrations of toxaphene residues found in stocked bluegills. Accumulated toxaphene in killed bluegills correlated well with fat content of the fish. Based on the changes in the toxaphene signature in gas chromatography, it is proposed that there is a partial degradation of some of the more toxic components of toxaphene. (Holoman-Battelle)

THE INFLUENCE OF ORGANIC DECOMPOSITION ON CARBON DIOXIDE HYDROGEN SULFIDE, DISSOLVED OXYGEN, AND ALGAE GROWTH IN THE DWORSHAK RESERVOIR,
Idaho Univ., Moscow. Dept. of Bacteriology and Biochemistry.
A. J. Lingg.
Available from the National Technical Information Service as PB-226 252 $3.00 in paper copy, $1.45 in microfiche. University of Idaho, Moscow, Water Resources Research Institute Technical Completion Report, November 1973. 32 p, 15 fig, 1 tab, 12 ref. OWRR A-033-IDA (1).

Descriptors: Bacteria, *Carbon dioxide, *Decomposing, Water Quality, Reservoirs, Impoundment, *Hydrogen sulfide, *Idaho, *Dissolved oxygen, *Entroplication.
Identifiers: *Dworshak Reservoir (Ida), Clearwater River (Ida), Carbon prediction, *Algal growth.

In order to meet the increased demands on domestic, industrial and recreational water supply, it is necessary to maintain, and in many cases to upgrade, the quality of water resources. In order to accomplish these tasks, it is paramount to fully understand those factors, natural and artificial, which lead to accelerated deterioration of rivers, lakes and streams. Rampant eutrophication leading to massive algal blooms, anaerobic conditions and other undesirable qualities have been rapidly increasing for the last century. This project was designed to explore the role played by carbon and its subsequent use by bacteria on various chemical and biological parameters in Dworshak reservoir. Carbon contribution to the to the reservoir is primarily from the existing organic materials present on the preimpoundment floor. This study defines methodology enabling prediction of the levels of carbon in a reservoir prior to impoundment and explores some of the effects of that carbon. In addition, these methods can be used to determine the amount of leached carbon, readily useable, by heterotrophic bacteria. The effect of carbon utilization by bacteria on algal growth is also explored. In the laboratory this symbiotic effect leads to significant increases in algal biomass even at carbon levels as low as 1.3 ppm. The implication of this observation is that carbon can greatly stimulate algal growth rates and consequently algal blooms if made available by bacterial respiration.

WATER RESOURCES DEVELOPMENT IN THE MULLICA RIVER BASIN,
College of South Jersey, Camden. Dept. of Zoology.
J. B. Durand, L. Granstrom, and N. S. Rudolph.
Available from the National Technical Information Service as PB-226 239 $3.00 in paper copy, $1.45 in microfiche. Water Resources Research Institute, Rutgers-The State University of New Jersey, Report 20 p, September 1973. 4 fig, 1 tab, 4 ref. OWRR B-014-N.J (4), B-018-N.J., A-018-N.J. (4).

Descriptors: *Aquatic habitats, *Environmental effects, *Water supply development, *Conjunctive use, *Systems analysis, Aquatic environment, Estuarine environment, Ecology, Limiting factors, Water yield, Dependable supply, Groundwater, Potential water supply, Surface water availability, Linear programming, *Salinity, Streamflow, *New Jersey, Withdrawl.
Identifiers: *Mullica River Basin (NJ).

The potential withdrawal of water from the Mullica River-Great Bay Estuary in southern New Jersey prompted a joint study by biologists and engineers to determine the maximum supply of water that could be diverted from the basin without causing undue environmental impacts. The effect of removal of water from the basin over long periods of time was simulated by review of records of a severe drought. Based on analysis of streamflows and salinities during these drought conditions, minimum mean monthly streamflow were determined corresponding to the maximum salinities tolerable by the fish and shellfish communities, important sources of revenue and recreation in the region. A physically optimized, chance constrained linear programming model was developed for the conjunctive use of ground and surface waters. Adjusting water withdrawal from streamflow and groundwater sources according to physical and seasonal criteria would permit substantial use of the basins's resources, with no additional burden on the ecology of the estuary.

A STUDY OF THE FACTORS DETERMINING THE OXYGEN UPTAKE OF BENTHAL STREAM DEPOSITS,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Environmental Sciences.
J. V. Hunter, M. A. Hartnett, and A. P. Cryan.
Available from the National Technical Information Service as PB-226 238, $3.00 in paper copy, $1.45 in microfiche. Water Resources Research Institute, Rutgers The State University of New Jersey Report, October 1973. 27 p, 2 fig, 9 tab, 15 ref. OWRR B-022-NJ (7) 14-31-0001-3107.

Descriptors: *Benthos, *Benthic fauna, *Biochemical oxygen demand, Oxygen demand, Organic wastes, Pollutants.
Identifiers: *Benthal oxygen demand, Tubificid worms.

The object was to investigate different observed values of benthal oxygen demand and to determine their relationship to various conditions and circumstances. The study showed little correlation between the concentrations and nature of the benthic organics and the benthal oxygen damand of the deposit. However, there was a correlation between the benthic macro-invertebrate population (bubificid worms) and the benthal oxygen demand, which is also supported by some conclusions reached by other investigators. Although the mechanism of this demand is not clear, it seems that it is for larger than that which would be due solely to the respiration of the organisms. The high oxygen demand associated with the worm populations indicates why the present investigation and other researchers have failed to correlate benthal demand with the chemical composition of the deposits. If as it appears, the influence of the worms raises the demand to a level up to six times the demand without the worms, the relaively small difference in the demands caused by organic contents would not be obvious. (Whipple-New Jersey)

CLEANLINESS OF WELLS, CHEMICAL SUBSTANCES IN DRINKING WATER AND THEIR RELATION TO CARIES (IN POLISH),
E. Wojtowicz, A. Macura, and R. Kwiatek.
Rocz Panstw Zakl Hig, Vol 23, No 1, p 15-21, 1972, English summary.
Identifiers: *Caries (Human), Chemicals, Cleanliness, *Water wells, Potable water, *Poland (Raba River valley), *Urochrome.

Two localities (A and B) lying in the Raba River Valley in Poland, were included in the study. In A, the prevalence of caries was 75%, but in B it amounted to 35% of the population. In locality A, 92% of the inhabitants had running water; in B, wells were the only source of drinking water. The water from wells was contaminated with urochrome, as judged from a high N content, large numbers of bacteria, and high O absorption. A relationship between urochrome contents in drinking water and the prevalence of caries was suggested.--Copyright 1973, Biological Abstracts, Inc.

STUDIES OF THE SINKING PLUME PHENOMENON,
Argonne National Lab., Ill. Center for Environmental Studies.
B. Hoglund, and S. A. Spigarelli.
Paper presented at Fifteenth Conference on Great Lakes Research 1972, Madison, Wisconsin, April 5-7, 1972. 16 p, 6 fig, 9 ref.

Descriptors: *Wisconsin, *Thermal pollution, *Lake Michigan, Lakes, Fish management, Insect eggs, Water temperature, *Nuclear power plants, Heated water, *Water pollution sources, *Environmental effects.
Identifiers: Sinking plumes.

The phenomenon of a 'sinking plume' was observed during March and April, 1971, at the Point Beach Nuclear Power Plant, Two Creeks, Wisconsin. Temperature recorders were placed on the bottom of Lake Michigan near the outfall of the plant. Analysis of the data revealed the warm water did interact with the bottom as long as the lake temperature was 4C or less. When the ambient temperature exceeded 4C, there was little indication of temperature perturbations on the bottom as a result of the thermal discharge. The maximum Delta T observed at the nearest thermograph (335 meters) was 5.2C. The maximum Delta T observed at 1,525 meters from the discharge was 2.6C. Ambient temperatures at 1,525 meters from the discharge were observed to vary by 2C. The data are presented in terms of the percentage of time the various instruments were influenced by the thermal plume. Biological implications of the 'sinking plume' with respect to premature hatching of fish and insect eggs and with respect to the viability of young fish are discussed. (Sinha-OEIS)

TREATMENT OF TANNERY EFFLUENTS BY PHYSICAL-CHEMICAL PROCESSES,
Calspan Corp., Buffalo, N.Y.
L. K. Wang, D. B. Dahm, R. E. Baier, and R. C. Ziegler.
Technical Paper presented at the 45th Annual Conference of the Water Pollution Control Federation, Atlanta, Georgia, October 1972. 36 p, 9 tab, 5 fig, 14 ref.

Descriptors: *Waste water treatment, *Tannery wastes, *Foam separation, Colloids, *Flotation, Carbon, *Adsorption, Surfactants, Suspended solids, Industrial wastes.
Identifiers: Surface adsorption.

A new unit process, adsorption-flotation, was found efficient for removing both dissolved organics and suspended solids. High removal was achieved by using powdered activated carbon to

adsorb most of the dissolved organic molecules in an aeration column containing tannery waste, then using a surfactant as a collector to remove residual organics, activated carbon, and other solid particles with rising bubbles. With the adsorption flotation followed by sedimentation, the fractional reductions of suspended solids, turbidity, color, protein, tannin, cyanide, and chemical oxygen demand were found to be all in excess of 0.9. Reductions of sulfide and chromium by pH adjustments with sulfuric acid and lime, respectively, were also demonstrated experimentally. The new adsorption flotation process could be a potential method for treating many industrial effluents; however, it is economically unfeasible for treating tannery waste.

MATHEMATICAL RELATIONSHIPS OF BOD REMOVAL IN ACTIVATED SLUDGE PROCESS,
Calspan Corp., Buffalo, N.Y.
L. K. Wang, and M. H. Wang.
Civil Engineering Bulletin, National Cheng Kung Univ., Volume 10, May 1969, p 81-85.

Descriptors: *Waste water treatment, *Activated sludge, Mathematical models, *Biochemical oxygen demand, Recycling, Kinetics, *Sludge treatment.
Identifiers: Complete mix, Batch system, Continuous system, Sludge recycle, Sludge yield.

Kinetics of completely mixed activated sludge process were reviewed, assessed and summarized. Based on the materials balances for the substrate and the sludge in an activated sludge reactor, the mathematical equations of substrate removal rate, sludge growth rate, and critical dilution rate can be derived for a continuous activated sludge process with or without recirculation. The behavior of an activated sludge continuous flow system can be logically predicted for any combination of initial substrate concentration, volumetric feedback ratio, cell concentration factor, and dilution ratio if the maximum sludge growth rate, the cell yield coefficient, and the saturation constant are known.
W74-02176

COST EFFECTIVENESS IN POLLUTION CONTROL--TREATMENT OF GLUE FACTORY WASTES BY CARBON ADSORPTION SYSTEM,
Calspan Corp., Buffalo, N.Y.
L. K. Wang, R. P. Leonard, D. B. Dahm, R. C. Ziegler, and R. E. Baier.
Proceedings of the Fifth Annual Northeastern Regional Antipollution Conference, University of Rhode Island, R.I., 1972. p 87-114. 10 tab, 4 fig, 10 ref.

Descriptors: Estimated costs, Costs, *Waste water treatment, Activated carbon, Adsorption, Coagulation, Industrial wastes, Physiochemical properties.
Identifiers: Powdered carbon, Organic coagulant, Dissolved protein, Glue factory wastes.

In an animal glue plant, the two waste streams of greatest concern are the alkaline waste containing ime, protein, blood, and dirt from the lime curing nd washing operations, and the acid waste conaining sulfuric acid, chromium sulfate, dissolved rganics, and hydrochloric acid from the acid reatment, washing, and neutralization operations. There has been little success in developing dequate and economical methods for the abatenent of glue factory pollutant discharges. A twotage powdered carbon adsorption system dosing ,000 mg/l of carbon for each stage would satisfy he present New York effluent standards. The econdary treatment cost would be about 30 cents er thousand gallons (or about $900 per day). If a ertiary sand filtration process is included, there ould be an additional 10.1 cents per thousand galns (or about $300 per day) cost.
W74-02177

IN SITU TREATMENT METHODS FOR HAZARDOUS MATERIAL SPILLS,
Calspan Corp, Buffalo, N.Y.
R. C. Ziegler, and J. P. Lafornara.
Proc. of National Conference on Control of Hazardous Material Spills, March 1972. 49 p, 10 fig, 9 tab. EPA 68-01-0110.

Descriptors: Lakes, *Waste water treatment, *Carbon, *Adsorption, *Flotation, Neutralization, Chemical precipitation, *Heavy metals, Ammonia, Chlorine, Activated carbon.
Identifiers: Organic pollutants, Granular carbon, Sodium sulfide, *Hazardous materials spills.

Several methods for coping with water and land spills of hazardous materials are discussed. For water spills of heavy metals, treatment with sodium sulfide to form a sulfide precipitate is described. Laboratory and field data are presented which illustrate the general utility of this method. Methods are suggested for neutralizing spills of ammonia and chlorine. For treating water spills of certain organic pollutants and heavy metal salts, adsorption by activated carbon is shown to be promising. Data are presented on the effects of pollutant concentration on carbon adsorption efficiency. Flotation techniques for retrieving powdered activated carbon from the treated water are described, and the use of granular activated carbon in porous bags is considered as a means for overcoming the disadvantages of introducing carbon directly into the bulk water. Methods are available for controlling land spills of hazardous materials by treating the ground surface to prevent penetration and by gelling or congealing spilled liquids to immobilize them.
W74-02179

WATER AND SEWERAGE IMPROVEMENTS NEEDED IN 1975 IN CHATHAM COUNTY, GEORGIA.
Chatham County-Savannah Metropolitan Planning Commission, Savannah, Ga.

February 1970. 115 p, 28 fig, 2 tab. HUD P-128, Urban Planning Grant.

Descriptors: *Planning, *Construction costs, Water supply, Water distribution, Waste water disposal, *Sewerage, Grants, *Georgia.
Identifiers: Urban water resource systems, Utility extensions, *Savannah (Geo), Chatham County (Geo).

Specific water supply and sewerage system improvements and their costs for Chatham County are presented. The report is the third in a series of planning studies which included a general program of water pollution abatement and water service extension for the county. The emphasis is on the specific costs and means of payment for each proposed improvement in each service area. Most of the report consists of tables listing the improvements and their costs. Some of the means for payments proposed are HUD grants, FWPCA grants (now EPA), and revenue bonds. The tables of improvements are organized to show which elements are eligible for federal grants. The report covers the period 1970 to 1975. (Elfers-North Carolina)
W74-02186

THE USE OF POWER PLANT HEAT IN A PHYSICAL-CHEMICAL DOMESTIC WASTEWATER RENOVATION SYSTEM,
Arizona Univ., Tucson. Dept. of Civil Engineering and Engineering Mechanics.
R. A. Sierka, and R. A. Fazzolare.
Available from NTIS as PB-226 141 $3.75 in paper copy, $1.45 in microfiche. Paper presented at National Conference on Complete Water Reuse, April 23-27, 1973, Washington, DC. Sponsored by American Institute of Chemical Engineers and Environmental Protection Agency. 28 p, 12 fig, 4 tab, 5 ref. OWRR-A-028-ARIZ (1). 14-31-0001-3503.

Descriptors: *Waste water treatment, *Sewage treatment, Reclaimed water, *Nuclear powerplants, Heated water, *Thermal pollution, Recycling.
Identifiers: *Heated sewage.

Seventy percent of the energy produced in a nuclear power reactor is rejected to the environment as low quality waste heat. One possible use of this heat source is for domestic wastewater treatment. This study examines a ferric-chloride, powdered activated carbon physical-chemical system in a one-step process as a function of temperature (20 deg-80 deg C) with COD, suspended solids, turbidity, and phosphorus removals used to monitor performance. Significant improvement in removal is obtained at higher temperatures with optimum results between 50 deg C and 60 deg C. Since urban wastewater flow and electric power usage are population-dependent and the system optimum treatment temperature coincides with waste heat characteristics, a combined power plant-wastewater system would generate recycleable water.
W74-02208

OPTIMUM DESIGN PERIOD FOR WATER POLLUTION CONTROL PLANTS,
H. C. Blersch.
Journal of the Institute of Water Pollution Control, Vol 72, No 2, p 223-226, 1973. 1 fig, 1 tab.

Descriptors: *Water pollution control, *Treatment facilities, *Design, *Long-term planning, *Evaluation, Economics, Capital, Investment, Decision making, Optimal development plans.
Identifiers: Ultimate design period, Stage design period, *South Africa.

This article extends the conclusions drawn by Zeperin in his contribution to the IAWRR Design Workshop in Vienna in 1971, concerning the optimum design period for water pollution control plants, by examining a series of hypothetical situations to determine whether any rule can be established which has a general application in the divergent conditions found in the South African context. The implication of long-term provision in basic planning varies widely among different situations, thus barring a quantitative generalization. Required essentially is that the implications be identified and evaluated as far into the future as possible, since the longer-term consequences of faulty, short-sighted planning may easily be out of all proportion to the immediate cost differences. Considered herein in detail are: (1) the ultimate design period, or life, of a plant which the designer should anticipate and provide for; and (2) the stage design period, the period for which the given stage of the works should be designed to serve before an extension becomes necessary. It is concluded that each case should be examined on its own merits, and in such examination it will be important that estimated costs for modules of various sizes and for basic and re-establishment costs are of relatively high accuracy in relation to one another. COST EFFECTIVENESS OF CURRENT ENVIRONMENTAL ENGINEERING PRACTICES,
Camp, Dresser and McKee, Boston, Mass.
R. C. Marini.
Water and Sewage Works, Vol 120, No 4, p R-21-R-28, April 1973.

Descriptors: *Environmental engineering, *Water pollution control, *Economic efficiency, *Optimum development plans, Costs, Mathematical models, Computer programs, Water quality, Dissolved oxygen, Construction, Management, Industrial wastes, Surveys, Systems analysis.
Identifiers: *Cost-effectiveness, Social benefits.

Large public sums will be spent on water pollution control, thus it is imperative to look at the cost effectiveness of current practices in environmental engineering. The most effective way to minimize costs is to plan and compare the costs and functional effectiveness of all available alternatives, including some alternatives that involve social and political considerations which may not be completely effective. The eight principal steps involved in developing optimum solutions to environmental engineering problems are given. Pilot plants, computers and mathematical models, industrial waste surveys, and construction management, four practices which are useful tools in implementing the principal steps, are discussed and case examples of their application are described. Pilot plant studies are conducted as a means for developing design factors and optimizing total costs for ultimate full-scale plants. A systems method relating cost to water quality has been derived, comprised of an economic, dissolved oxygen model and two computer programs (mixed integer and simulation). Industrial waste surveys are effective cost-saving tools for collecting data, in view of the increasing use of computers. Finally, the consulting engineer for, a wastewater treatment project should be its construction manager since he most freely and objectively can select the most economic and efficient equipment and practices. (Bell-Cornell)

MANUFACTURE OF CAPACITOR PAPER -- SOME PROBLEMS WITH FRESH WATER PREPARATION, (ERZEUGUNG VON KONDENSATORPAPIER -- EINIGE PROBLEME BEI DER FRISCHWASSERHERSTELLUNG),
O. Riessner.
Zellstoff und Papier, Vol 21, No 7, p 200-204, July 1972. 5 tab, 1 fig, 7 ref.

Descriptors: *Waste water treatment, *Industrial waters, *Ion exchange, *Pulp and paper industry, Freshwater, Demineralization, Ions, Cations, Anions, Anion exchange, Cation exchange, Water purification, Desalination, Resins, Water properties, Electrical conductance, Electric insulation, Conductivity, Capacitors.
Identifiers: *Condenser paper, *Capacitor paper, Dielectric properties, Dielectrics.

Because of presence of electroconductive cations and anions in the process water would impair the dielectric properties of capacitor and condenser papers, they must be removed as much as possible from the water supply of paper mills, along with suspended and dissolved solids in general. The water-treatment installation of an insulating paper mill must be designed on the basis of available water characteristics. Most installations in condenser paper mills comprise two stages, viz., a conventional treatment and a deionization stage. The latter involves passing the process water through a series of columns filled with cation- and anion-exchange resins. The resins used must possess high chemical, thermal, and mechanical resistance. Some typical examples are tabulated, along with the respective achievable minimum specific water conductivities and other desirable characteristics of the treated waters. (Speckhard-IPC)

USE OF FIBROUS MATERIALS FOR REMOVAL OF IRON AND IRON COMPOUNDS FROM THERMOELECTRIC POWER PLANT WATER AND CONDENSATES, (IZPOLZUVANE NA VLAKNEST MATERIAL ZA ULAVYANE NA ZHELEZO I ZHELEZNI SUEDINENIYA OT VODITE I KONDENZATITE NA TETS),
Z. Litovski, G. Litovska, and P. Boevska.
Tseluloza i Khartiya, Vol 3, No 6, p 14-17, Nov./Dec., 1972. 3 tab, 5 fig, 6 ref.

Descriptors: *Waste water treatment, *Pulp wastes, Water purification, *Boiler feed water, *Filters, *Fibrous beds, Iron, *Iron compounds, Demineralization, Pulp and paper industry, Retention, *Industrial water, Filtration, Hydration, Colloids, Dissolved solids, Clogging, Water treatment, Pressure.
Identifiers: Pulps, Kraft pulps, Sulfite pulps, Groundwood pulps, Semichemical pulps, NSSC (Neutral sulfite semichemical) pulps, Bleached pulps, Beating degree, Freeness, Fibrillation, Condensates.

In the purification of boiler feed waters and condensates, ion-exchange resins will not retain colloid particles and are readily clogged. These difficulties can be overcome by using pulps and similar fibrous materials as iron-retaining filters. When such fiber mats, which must be 3-10 mm thick, become saturated, they need not be regenerated, but can be disposed of. The Fe-retaining capacity of several pulp types (groundwood, neutral sulfite semichemical, bleached softwood kraft, and bleached softwood sulfite pulps) was investigated and was found to vary with the nature of the fibers, the filtration pressure, and the pulp 'freeness' (a measure of drainage or filtration resistance). High filtration rates lowered the retention of total, soluble, and colloidal Fe, whereas high 'beating degrees' (fibrillation and hydration) increased the Fe retention. Among the pulps tested, bleached sulfite pulp showed the best retention, viz., 72.5, 69.3, and 75% of total, dissolved, and colloidal Fe, respectively. (Stapinski-IPC)

HYLTE BRUK: NEWSPRINT AND ENVIRONMENTAL PROTECTION, (HYLTE BRUK: ZEITUNGSDRUCKPAPIER AND UMWELTSCHULTZ).

Das Oesterreichische Papier, Vol 9, No 7, p 23, 25-27, July 1972. 1 tab, 1 illus.

Descriptors: *Pulp wastes, *Waste water treatment, Pollution abatement, Pulp and paper industry, Europe, *Industrial wastes, Filtration, Coagulation, Sedimentation, Biological treatment, Flocculation, Waste treatment, Treatment facilities, Chemical precipitation.
Identifiers: *Sweden, Newsprint, Paper machines, White water, Groundwood mills, Newsprint mills, Pulp mills, Paper mills, *Environmental protection, *Combined treatment.

Hylte Bruks AB. in Sweden originally manufactured sulfite pulp and paper since 1907, but was taken over in 1970 by an association of 4 Swedish and 1 German company and expanded and converted to the production of groundwood and newsprint, in addition to building boards, partly in order to reduce water and air pollution problems. The old sulfite mill switched, for similar reasons, from Ca to Mg base cooking liquor. In addition to noise control, the expanded facilities provide for improved waste water treatment in a modern clarifier installation which permits no toxic matter to be discharged into the Nissan River. The newspaper machine's white water is being treated in four stages involving filtration, chemical flocculation plus sedimentation, biological oxidation with activated sludge, and chemical precipitation. The combined installation reduced the effluent BOD from 34 to 6 tons/day, the discharge of suspended solids from 16 to 2 tons/day, and the discharge of lignin from 78 to 3 tons/day. Partly as a result of closing the still operating pulp bleachery, a further reduction of BOD to 4.5 tons/day is expected by 1975. Of the total capital invested in the expanded production, namely 255 million Swedish Crowns, ca. 10% was spent on environmental protection measures. (Speckhard-IP)

WASTE WATER RESEARCH FOR THE PULP AND PAPER INDUSTRY AT THE DARMSTADT TECHNOLOGICAL INSTITUTE (ABWASSERFORSCHUNG FUER DIE PAPIER-UND ZELLSTOFFINDUSTRIE AN DER TH DARMSTADT),
Technische Universitaet, Darmstadt (West Germany). Wasser- und Abwasserforschungsstelle.
W. Brecht.
Das Oesterreichische Papier, Vol 9, No 7, p 15-19, July 1972. 1 tab, 4 fig, 26 ref.

Descriptors: Foreign research, *Waste water treatment, *Pulp wastes, Water conservation, Research facilities, *Pulp and paper industry, Europe, *Industrial wastes, Effluents, Sludge disposal, *Sludge treatment, *Recycling, Pollution abatement, Water pollution sources, Water pollution treatment, Freshwater, Research and development, Research priorities, Dewatering, Pulp wastes, Bibliographies, Suspended solids.
Identifiers: *Germany, White water, Chemical recovery, Fiber recovery, Papermaking.

The Research Center for Water and Waste Water (WAF) of the Institute for Paper Manufacture at the Technological Institute in Darmstadt pursues research studies in the following areas: Biological, chemical, and physico-mechanical treatment of paper industry effluents; recycling of aqueous effluents for minimization of freshwater consumption in paper mills; recovery of fibers, fillers, and other papermaking additives from paper machine white water for improved process economy and waste water clarification; and dewatering and disposal of sedimented effluent sludges. A bibliography of technical reports published by WAF between 1957 and 1970 is appended. The ecological significance of these investigations is pointed out and discussed in historical perspective, and problems awaiting further developments are indicated. (Speckhard-IPC)

SODIUM RECOVERY FROM A PULP MILL WASTE EFFLUENT BY ION EXCHANGE,
Himsley Engineering Ltd., Toronto (Ontario).
A. Himsley.
Ion Exchange and Membranes, Vol 1, No 1, p 51-56, 1972. 4 fig, 4 ref.

Descriptors: *Pulp wastes, Water pollution control, Pollution abatement, *Waste water treatment, Treatment facilities, *Ion exchange, Automatic control, *Sulfite liquors, *Sodium compounds, Pulp and paper industry, Water pollution sources, Canada, Effluents, Neutralization, Sulfuric acid, Sodium hydroxide, Alcohols.
Identifiers: Vanillin, Sulfite alcohol, Spent sulfite liquor, Ethanol (or Ethyl alcohol), *Chemical recovery, Sodium sulfite, Spent liquors.

The sulfite pulp mill of Ontario Paper Co. in Thorold, which uses sodium-base sulfite cooking liquor, produces also 95% ethyl alcohol (sulfite alcohol) and vanillin from its spent sulfite liquor. Maximum vanillin production requires excess caustic which, in turn, consumes 50 tons per day

of sulfuric acid for waste stream neutralization. In order to recover the large volume of sodium-base chemicals from the effluent, a complicated ion-exchange system utilizing the fixed-bed technique was developed and scaled up into a fully automated commercial installation, in which the need for specially trained operators was obviated by built-in logic circuitry and simple alarm systems. EFFLUENT TREATMENT AT MAN-MADE FIBRE PRODUCTION UNITS,
Courtaulds Ltd., Coventry (England). Research Div.
T. R. Jones.
Effluent and Water Treatment Journal, Vol 12, p 352-355, 1972.

Descriptors: *Textiles, *Industrial wastes, *Waste water treatment, Water pollution control, *Pollution abatement, *Water pollution sources, Effluents, Waste treatment, Activated sludge, Biological treatment, Microorganisms, Bacteria, Color, Toxicity, Pollutants, Cellulose, Sulfates, Sulfur compounds, Sulfur bacteria, Zinc, Carbohydrates, Ion exchange, Sulfides, Dye releases, Dyes, Recycling, Monitoring.
Identifiers: *Synthetic fibers, Hemicelluloses, Cyanides, Viscose rayons, Viscose process, Zinc sulfate, Zinc compounds, Dissolving pulps, Carbon disulfide, Spinning, Washing, Chemical recovery, Plating, Carbon fibers, Sulfuric acid, Spent liquors.

Most textile fiber production technologies involve dry processes, such as the spinning of acetate, acrylic, polyamide, polyester, and glass fibers, thus causing no effluent problems. Others give rise to effluents that are conveniently treatable by biological methods, such as wet spinning and fiber washing wastes. Removal of cyanide is necessary with steel tire cords which require brass plating, and with carbonized fibers which emit hydrogen cyanide. The oldest and most important man-made fiber, viscose rayon, consumes large amounts of water and requires sodium hydroxide, carbon disulfide, zinc sulfate, and sulfuric acid as major chemicals in the mercerization, xanthation, ripening, cellulose regeneration, coagulation, and spinning stages. Process economy, and environmental protection call for optimum chemical recovery, as well as for effluent treatment to remove BOD-consuming hemicelluloses originating from the wood pulp (mostly spruce and eucalyptus). Zinc sulfate, which is toxic and most objectionable, can be removed from effluents by ion-exchanged resins and/or reaction with sodium hydroxide after preliminary neutralization with calcium hydroxide. Sulfide-bearing alkaline spent liquors are conventionally treated with Thiobacillus thiooxidans, using the activated sludge technique. Correct choice of fiber dyes and pigments permits closed-circuit operation and avoidance of colored effluents. Accidental spills must be prevented by careful storage of chemicals, installation of traps, and well-planned effluent monitoring and safe factory housekeeping practices. (Witt-IPC)

REMOVAL OF ORGANIC MATERIAL BY ADSORPTION ON ACTIVATED CARBON,
Chemviron S.A., Brussels (Belgium).
R. A. Davies, H. J. Kaempf, and M. M. Clemens.
Chemistry and Industry, No. 17, p 827-831, September 1,1973. 1 tab, 8 fig, 4 ref.

Descriptors: *Water treatment, *Waste water treatment, *Activated carbon, *Sewage treatment, Tertiary treatment, Treatment facilities, Industrial wastes, Pollution abatement, Color, Odor, Taste, Pollutants, Effluents, Operating costs, Costs, Potable water, Industrial water, Irrigation water, Toxicity, Incineration, Granules, Particle size, Adsorption, Water reuse.
Identifiers: *Lake Tahoe (Calif-Nev).

Activated carbon has found widespread use for prepurification of potable and industrial waters and treatment of municipal and industrial waste waters, not only for removal of color, taste, and odor, but also for prevention of pollution by pesticides and other biodegradable and nondegradable organics in general. The physical principles of adsorption on carbon particles and beds are reviewed, and some process engineering considerations are discussed, including costs of granular carbon reactivation, justification of combustion furnaces, and relative merits of powdery vs. granular carbons. The first full-scale application of granular carbon for tertiary treatment was at Lake Tahoe, where aeration tank effluent is passed through eight parallel adsorbers to reclaim daily 28,000 cu m of irrigation water. At Windhoek, South Africa, potable water is recovered from sewage in a plant processing 200 cu m/hr. Three typical industrial installations where granular carbon finds use in removal of toxic and colored effluent components include a Swiss explosive factory, a herbicide factory on the U.S. West Coast, and a carpet mill in Pennsylvania. (Brown-IPC)
W74-02264

REMOVAL OF ORGANIC MATTER FROM WATER BY RESINOUS ADSORBENTS,
Bayer A. G., Leverkusen (West Germany).
C. Oehme, and F. Martinola.
Chemistry and Industry, No 17, p 823-826, September 1, 1973. 3 tab, 4 fig, 2 ref.

Descriptors: *Waste water treatment, Water treatment, *Ion exchange, *Anion exchange, *Humic acids, Lignins, Pores, Porosity, *Resins, Fouling, *Detergents, Pollutants, Separation techniques, Industrial wastes, Liquid wastes, Adsorption, Dyes, Metals, Surfaces, Sulfonates, Water reuse, Recycling, Organic matter.
Identifiers: *Lignosulfonic acids.

Weakly basic anion exchangers having a surface area of 40-80 sq m/g and an average pore diameter of 300-500 Angstrom are especially suitable for demineralization of waters polluted by humic and lingnosulfonic acids and anionic detergents. Strongly basic macroporous organic scavengers can be used to remove humic acids from water and waste water, provided the resins are not fouled by anionic detergents. Special macroporous adsorber resins can remove nonionic detergents from rinse water of metal plating shops. Various types of resinous adsorbents should also be considered for treating and recycling waste waters of dye works. (Brown-IPC)

REDUCTION OF BOD AND PHOSPHATE BY CHEMICAL PRECIPITATION. UTILISATION OF SLUDGE,
Uhde (Friedrich) G.m.b.H., Dortmund (West Germany).
E. Hosenfeld, and W. Liebig.
Chemistry and Industry, No 12, p 565-567, June 16, 1973. 1 fig.

Descriptors: *Sludge treatment, Aluminum, *Phosphates, Sewage treatment, *Coagulation, Sulfates, Calcium, Metals, Deionization, Viruses, *Biochemical oxygen demand, Aquatic microorganisms, Fertilizers, Dewatering, Drying, Costs, Operating costs, Capital costs, Public health, Incineration, Europe, *Chemical precipitation, *Waste water treatment.
Identifiers: *Aluminum sulfate, Precipitants, Coagulants, Sweden.

Aluminum sulfate is an excellent precipitant which is used in over 90% of the 300 Swedish sewage-treatment installations. It removes not only phosphate detergents threatening eutrophication of lakes, but also BOD-consuming organic compounds, metallic and other ions, and pathogens, notably viruses. Precipitation can be performed in four modes, viz., direct, preliminary, simultaneous, or final precipitation. The latter gives the best results, i.e., 95% removals of BOD and phosphate. Although virus removals of 99.0-99.9% can be achieved, the clarified sludge must not be reused as fertilizer without pasteurization. Coprecipitation in the presence of calcium, i.e., under neutral conditions, will remove most metals in true solution around pH 7. Metering station with silo and dissolving equipment for granular aluminum sulfate (costing ca. 13 British pounds/ton in Sweden) may require a capital investment of 4,000 to 20,000 British pounds. Total capital plus operating costs for chemical precipitation are estimated at 0.005-0.01 German Marks per inhabitant per day. Effluent purification by final precipitation requires 10% more capital than biological treatment and ca. 25% higher total cost. Sludges can be treated in three different ways: (1) aerobic stablization and drying, (2) anaerobic stabilization in towers plus dewatering, and (3) mechanical dewatering and incineration. Precipitated sludge can find uses as soil fertilizer, bacterial culture medium, supplementary animal fodder (after proper treatment), and raw material for recovery of elementary phosphorus by a Danish patented thermocraking process. (Brown-IPC)

ION EXCHANGE AND ALLIED PROCESSES IN WATER RECOVERY,
Permutit Co. Ltd., London (England).
J. E. Goddard.
Chemistry and Industry, No 12, p 563-565, June 16, 1973. 2 fig, 2 ref.

Descriptors: *Waste water treatment, *Treatment facilities, *Economic efficiency, *Cost analysis, *Reverse osmosis, *Electrodialysis, Water treatment, Operating costs, Costs, Cost comparison, Capital costs, Electric power, Membrane processes, Membranes, Water reuse, Water quality, *Ion exchange.
Identifiers: Hollow fibers, Ion exchangers, Reverse osmosis modules.

The operating principles, applications, and capital and operating costs of ion exchange, electrodialysis, and reverse osmosis are compared. The cost of ion-exchange installations varies between 400 and 1000 British pounds per cu m/hr of water treated,

depending on number and size of resin beds required and on flow rate, feed concentration, resin combination, cycle time, operating pressure, construction materials, and degree of automation. Although power costs for electrodialysis can be estimated from Faraday's law, polarization effects tend to increase them in practice, as does the need for acid dosing to prevent scaling in dialysis cells. Various types of osmotic membrane systems are now available, the latest development being Du Pont's hollow-fiber polyamide module with outside-to-inside passage of water. Operating costs are divided between power demand and membrane amortization. Commercial systems operating at 28 or 42 kg/sq cm (400 to 600 psi) consume ca. 2.6 kw-hr/cu m of treated water; membranes guaranteed to last 3 yr come to 0.03 British pound/cu m of trated water. The choice among these three treatment processes depends on numerous variables and economic considerations, including the desired treated water quality. These factors are discussed in some detail. (Brown-IPC)
W74-02268

IN-PIPE WASTEWATER CLEANUP.

Chemical Engineering, Vol 80, No 22, p 32, 34, Oct. 1, 1973. 1 fig.

Descriptors: *Sewage treatment, *Waste water treatment, *Pressure conduits, *Activated sludge, *Oxygenation, Pipelines, Recycling, Water reuse, Irrigation water, Fermentation, Oxygen, Aeration, Biochemical oxygen demand, Monitoring, Engineering structures, Injection, Suspended solids, Filtration, Separation techniques, Liquid wastes, Chlorination, Flotation, Sludge, *California.
Identifiers: *Pressure pipe treatment.

Encouraging results, notably capital cost savings of nearly 40%, are reported for the Pressure Pipe Treatment (PPT) of sewage and industrial wastes developed and funded by the Irvine Ranch Water District, Irvine, California, after four years of laboratory and pilot studies. The patented system combined purification of waste waters via activated sludge fermentation with long-distance (about 6.5 miles) conveying of treated water to the reuse site. The PPT flow scheme involves an initial high-rate screening step to separate solids which are then ground and sent to an aerobic sludge activator, in which the detention time for maximum activation (3-4 days) is shorter than for complete digestion. Activated sludge is then combined with the liquid portion of the sewage inside the pipeline, with facilities for en-route injection of air or oxygen and on-line BOD monitoring. For forest irrigation and similar applications, the pipeline effluent can be used directly; otherwise, an air flotation separator will remove sludge, some of which is recycled as seed material through existing regional waste-collection sewers, and the balance is used for soil conditioning. The sludge-free water is treated in a sand filter for further removal of suspended solids and BOD reduction. Some reclaimed water may be chlorinated or subjected to other final processing, such as nitrogen removal, before reuse. The main advantage of PPT is its nearly 100% utilization of the oxygen supplied, in contrast to the 6% efficiency of conventional secondary treatments. Popeline flow rates of 0.5 to 6.0 ft/sec are envisioned, along with pipe residence times as short as 1 hr. (Brown-IPC)

DRY ACTIVATED SLUDGE AS FERTILIZER FOR WINTER WHEAT AND CORN, (SUKHOI AKTIVNYI IL KAK UDOBRENIE DLYA POSEVOV OZIMI PSHENITS' I KUKURUZ'),
L. G. Tsvetkova, and L. S. Miroshnichenko.
Gidroliznaya i Lesokhimicheskaya Promyshlennost', Vol 25, No 3, p 18-20, 1972. 6 tab.

Descriptors: *Activated sludge, *Sludge disposal, *Soil disposal fields, *Fertilizers, Nitrogen compounds, Phosphorus compounds, Farm management, Agricultural chemicals, Chlorophyll, *Corn (Field), Cereal crops, *Wheat, Field crops, Effluents, Waste water treatment, Hydrolysis, Yeasts, Industrial wastes, Proteins, Waste disposal, Chemical industry.
Identifiers: Carotene, Wood hydrolysis, Hydrolyzates, Hydrolysis industry.

Agricultural farm plots were treated, prior to the sowing of winter wheat and corn, with 40 kg/ha of a nitrogen-phosphorus mineral fertilizer in comparison with 1 ton/ha of dried activated sludge obtained from the effluent-treatment plant of the Zaporozhe hydrolysis and yeast factory in the USSR. Both types of fertilizer produced similar increases in leaf chlorophyll and carotene and in grain protein contents over unfertilized control plots, but the activated sludge induced higher crop yields compared to the conventional fertilizer. EXPERIENCE WITH THE OPERATION OF PURIFICATION EQUIPMENT, (OPYT EKSPLUATATSII OCHISTNYKH SOORUZHENII),
Tavdinskii Gidroliznyi Zavod (USSR).
P. G. Pavlos, A. E. Norina, L. V. Korenyuk, and F. G. Kardash.
Gidroliznaya i Lesokhimicheskaya Promyshlennost', Vol 25, No 6, p 21-23, 1972. 2 tab.

Descriptors: *Waste water treatment, *Industrial wastes, *Water pollution sources, *Treatment facilities, Chemical industry, Wood wastes, Hydrolysis, Yeasts, Sedimentation, Filtration, Aeration, Fermentation, Waste treatment, Biochemical oxygen demand, Chemical oxygen demand, Carbohydrates, Mixing, Effluents, Water pollution, Pollutants.
Identifiers: Hydrolysis industry, Hydrolyzates, Mixers, Wood hydrolysis, Furfural, *USSR (Tavda).

In 1970, the Tavda hydrolysis factory (USSR) installed an effluent treatment system simultaneously with the startup of a yeast production facility for the processing of wood hydrolyzates. Effluents from the fermentation and yeast-cultivation operations are passed through sand filters and primary sedimentation tanks, then purified with aerated biological filters and subjected to a secondary sedimentation. The process removes about 60% of the five-day BOD and 80% of the COD (in terms of permanganate-oxidizable matter). Because neither the purification degree nor the capacity of the treatment facilities is sufficient to avoid discharging considerable portions of the effluent into the river without purification, additional equipment installations are being planned, along with process modifications. Residual fermentation liquor will be reused to prepare nutrient salts and to dilute the nutrient medium. A milder hydrolysis process is contemplated to reduce the undesirable degradation of fermentable sugars. A mixer is to be installed to accelerate the decomposition of furfural (which interferes with the yeast fermentation). (Stapinski-IPC)

THE CPAR PROGRAM - GOVERNMENT-INDUSTRY COOPERATION IN POLLUTION ABATEMENT RESEARCH,
Department of the Environment, Ottawa (Ontario).
J. E. Stone, and R. J. Neale.
In: TAPPI Environmental Conference, San Francisco, May 14-16, 1973. Preprinted Proceedings, TAPPI, Atlanta, Ga., p 5-8.

Descriptors: *Canada, *Research and development, *Governments, *Pollution abatement, *Pulp and paper industry, Grants, Contracts, Financing, *Waste water treatment, Water quality control, Air pollution, Industrial wastes, Pollutant identification, Toxicity, Analytical techniques, Aquatic life, Sulfite liquors, Color, Biochemical oxygen demand, Bioassay, Measurement, Coordination, Management.

The Cooperative Pollution Abatement Program (CPAR) of the Canadian government is designed to fund research projects between mid-1970 and March 1976 aimed at the development of better and cheaper methods of controlling water and air pollution in the pulp and paper industry. The joint government-industry nature of the program, its operation, and some typical projects thus far supported are outlined. In the water pollution abatement sector, the coordinating committee recognizes 7 general areas of research needs: (1) reduction of toxicity of effluents to aquatic flora and fauna, (2) reduction of effluent BOD, (3) recovery of spent sulfite liquors, (4) removal of suspended solids, (5) determination of cause-and-effect relationships between pollutants and the environment, (6) reduction of effluent color, and (7) development of measurement methods, notably rapid estimation of 5-day BOD and toxicity prediction from other than bioassay techniques. WATER QUALITY CONTROL PROGRAM AT PUBLISHERS PAPER CO.,
Publishers Paper Co., Oregon City, Oreg.
C. Mayer, Z. Rozyski, and A. L. Caron.
In: TAPPI Environmental Conference, San Francisco, May 14-16, 1973. Preprinted Proceedings, TAPPI, Atlanta, Ga., p 9-14, 6 tab, 4 ref.

Descriptors: *Pulp wastes, *Treatment facilities, *Waste water treatment, *Pollution abatement, *Oregon, Pulp and paper industry, Sulfite liquors, Magnesium hydroxide, Magnesium compounds, Incineration, Filtration, Sludge treatment, Sludge disposal, Suspended solids, Aerated lagoons, Aeration, Biochemical oxygen demand, Operating costs, Capital costs, Costs, Economic efficiency, Filters, Waste treatment, Industrial wastes.
Identifiers: Willamette River (Ore), Sulfite mills, Groundwood mills, Newsprint mills, Clarifiers, White water, Integrated pulp and paper mills.

Publishers Paper Co. operates two integrated pulp and paper mills in Oregon City and Newberg, Oregon, which produce refiner groundwood, Mg-base sulfite pulp, newsprint, and tissue papers. Over a five-year period, the company invested $19.5 million in chemical recovery and effluent treatment installations, partly for pollution protection of the Williamette River. Aside from the initial conversion of the sulfite pulping and spent liquor recovery system to a soluble-base cooking liquor, these facilities included white water clarifiers, sludge-dewatering filters, and smokeless incinera-

tors to accomplish ca. 90% removal of suspended solids, as well as aerated stabilization basins to achieve BOD reductions of ca. 98%. Operating costs are calculated at ca. $11 per ton of solids removed and $0.02 per pound of BOD removed. (Brown-IPC)

In: TAPPI Environmental Conference, San Francisco, Calif., May 14-16, 1973. Preprinted Proceedings TAPPI, Atlanta, Ga., p 27-49, 18 tab, 4 fig.

Descriptors: *Sludge disposal, *Sludge treatment, *Pulp wastes, *Economic, Costs, Incineration, Byproducts, Fertilizers, Mulching, Soil amendments, Agronomic crops, Crop production, Dewatering, Drying, Marketing, Water reuse, Recycling, Waste water treatment.
Identifiers: Materials handling, Baling.

Four methods for reuse of fibrous sludge from primary effluent-treatment plants of pulp and paper mills are described and evaluated. They include (1) incineration in an entrained- air dryer-furnace, (2) combustion in hogged-fuel boilers, (3) agricultural soil conditioning, and (4) hydromulching for soil stabilization. Sludge properties varied considerably, but could be characterized with frequent sampling by determinations of Canadian Standard Freeness, ash content, and fiber size distribution. The variability of composition limits the use of sludge for by-products. Sludge sales are also restricted to bulk material of 30-40% consistency, requiring adequate handling facilities at loading-unloading sites. Baling after semidrying incurs further cost. The air-entrained incinerator involved high maintenance costs, owing to high temperature, high gas velocity, and high solids flow, but did meet air quality standards with proper operation. Sludge disposal by incineration cost ca. $13/dry ton, compared to $11.50 for combustion in hog-fuel boilers. In test farm plots, high sludge levels left to decompose for 1 year before crop planting resulted in significantly increased yields for two successive bean and corn harvests. However, addition of equivalent amounts of fresh sludge to yearly amended plots gave reduced crop yields, owing to nitrogen deficiency. Beans matured faster in plots amended with 400 and 600 tons of sludge per acre than in control plots. On a simulated highway cut, hydromulched sludge with or without bark dust proved to be competitive with a commercial product in establishing a grass stand. (See also W74-02273) (Brown-IPC)

ADVANCED PRACTICAL WATER RECYCLE IN TISSUE MANUFACTURE,
Kimberly-Clark Corp., Neenah, Wis.
A. R. LeCompte.
In: TAPPI Environmental Conference, San Francisco, May 14-16, 1973. Preprinted Proceedings TAPPI, Atlanta, Ga., p 50-65, 4 fig, 1 ref.

Descriptors: *Pulp wastes, *Waste water treatment, *Water reuse, Pulp and paper industry, *Industrial wastes, Effluents, Pollution abatement, *Recycling, Filtration, Sedimentation, Aeration, Calcium compounds, Magnesium compounds, Carbon dioxide, Lime, Calcium carbonate, Magnesium carbonates, Carbonates, Bicarbonates, Polyelectrolytes, Biochemical oxygen demand, Chemical oxygen demand, Suspended solids, Water quality control, *Canada, Industrial water.
Identifiers: Tissue papers, Paper machines, White water, Big East River, Canada, Ontario (Canada).

Built in a resort area, the Huntsville (Ontario) tissue mill of Kimberly-Clark of Canada Ltd. controls pollution of the Big East River by a water reclamation system which recycles about 87% of the process water to a high-speed tissue paper machine at rates of up to 2.5 million gal/day, while reducing the effluent to ca. 0.19 million gal/day. The multistage water and effluent treatment involves essentially retention in a polishing basin, aeration, and filtration through twin one-acre percolation beds. Chemicals used for removal of color, suspended solids, and corrosive components include Mg and Ca bicarbonates, carbon dioxide, unslaked reactive Ca oxide, precipitated Ca carbonate, and two unspecified polyelectrolytes. The treated effluent contains no color bodies, only 2.5 lb/day of nonfilterable residue, 1.8 to 6.0 lb of 5-day BOD loading, and 36 lb/day of COD. Its discharge increases the river's solids content from 45 to 480 mg/liter, but the effects of this on other stream qualities are said to be undetectable by conventional test methods. W74-02279

ADVANCED TREATMENT OF PURIFIED SEWAGE FOR PRODUCTION OF HIGH--BRIGHTNESS PULP AND PAPER,
South African Pulp and Paper Industries Ltd., Springs. Enstra Mill.
H. J. Jacobs, and L. Smith.
In: TAPPA Environmental Conference, San Francisco, May 14-16, 1973. Preprinted Proceedings TAPPI, Atlanta, Ga., p 51-58, 5 tab, 7 ref.

Descriptors: *Water reuse, *Sewage treatment, *Industrial water, Water supply, *Pulp and paper industry, Africa, Biological treatment, *Tertiary treatment, Flotation, Water purification, Freshwater, Water resources development, Coagulation, Corrosion, *Waste water treatment.
Identifiers: *South Africa, Aluminum sulfate, Polyfloc 84 D, Corrosion inhibitors, Vaal River (South Africa).

The Enstra mill of SAPPI has a daily production of ca. 190 tons bleached kraft pulp, 135 tons semibleached kraft pulp, 140 tons fine paper, and 200 tons newsprint. Of the mill's daily water supply, only 4.2 million U.S. gal is freshwater, pumped from the Vaal River 60 miles away. The greater proportion (6.6 million gal) derives from biologically purified and tertiary-treated sewage refined by a flotation process, using alum in conjunction with a polyelectrolyte (Davco Polyfloc 84A) to reduce alum dosage, plus NaOH to reduce water corrosivity. The development of this water treatment process is sketched from laboratory through pilot-plant studies to full-scale operation. The papermaking suitability of the sewage-derived process water is evaluated by means of a specially developed handsheet brightness test. (See also W74-02273) (Brown-IPC)
W74-02280

TREATMENT OF SULFITE EVAPORATOR CONDENSATES FOR RECOVERY OF VOLATILE COMPONENTS,
Institute of Paper Chemistry, Appleton, Wis.
I. W. Baierl, B. F. Lueck, and A. J. Wiley.
In: TAPPI Environmental Conference, San Francisco, Calif., May 14-16, 1973. Preprinted Proceedings TAPPI, Atlanta, Ga., p 73-87, 1 tab, 11 fig.

Descriptors: *Pulp wastes, *Water reuse, Water purification, *Waste water treatment, *Activated carbon, *Byproducts, Pulp and paper industry, Biochemical oxygen demand, Chemical oxygen demand, Alcohols, Organic compounds, Sulfur compounds, Sulfite liquors, Water pollution treatment, Water pollution sources, *Recycling.
Identifiers: Methanol, Ethanol, Furfural, Sulfur dioxide, Sulfite pulp mills, Evaporator condensates, Condensates.

Cooperative research studies on the removal of pollutants from sulfite pulp mill evaporator condensates have been conducted for five years in two separate projects supported by the Environmental Protection Agency, the Wisconsin Dept. of Natural Resources, and ten pulp and paper companies. They are based partly on preliminary work done at Scott Paper Co. and the Lowell Technological Institute. A pilot plant for the Scott system, installed at the Appleton Division (Wisconsin) of Consolidated Papers Inc., involves steam stripping, adsorption on activated carbon, and fractional distillation. Operating experience showed that relatively pure sulfur dioxide, methanol, furfural, and acetic acid can be recovered, with excellent simultaneous reduction of condensate COD and BOD and with production of water sufficiently pure to be reused in the mill. The second system, based on a low-temperature (20 C) thermally regenerated activated carbon adsorption column, is being operated in the IPC laboratories, using a Lowell-designed unit in which the carbon can be reused through 31 or more cycles. Some process operating data and experiences for both systems are reported. (See also W74-02273) (Brown-IPC)
W74-02281

PROCESS WATER REUSE AND UPSET CONTROL MODIFICATIONS AT AN INTEGRATED NSSC MILL,
Green Bay Packaging Inc., Wis.
W. R. Nelson, G. O. Walraven, and D. C. Morris.
In: TAPPI Environmental Conference, San Francisco, May 14-16, 1973. Preprinted Proceedings TAPPI, Atlanta, Ga., p 219-227, 2 tab, 9 fig.

Descriptors: *Waste water treatment, *Pulp wastes, *Pollution abatement, *Treatment facilities, *Water reuse, Pulp and paper industry, Industrial water, Water purification, Effluents, Incineration, Evaporation, Water pollution treatment, *Wisconsin, Monitoring, Dissolved solids, Biochemical oxygen demand, Costs, Cost-benefit analysis, Reverse osmosis, Sewers, Rivers.
Identifiers: Corrugating medium, NSSC pulping, Fox River (Wis).

At Green Bay, Wis., Green Bay Packaging Inc. operates an integrated sodium-base NSSC (neutral sulfite semichemical) pulp and paperboard mill on the Fox River, manufacturing 295 tons/day of corrugating medium on a high-speed fourdrinier machine. Process water for the mill is taken from the river, but not pretreated, except for steam boiler makeup softening. The daily production of 200 tons of NSSC pulp from hardwoods gives rise to 200,000 lb/day of dissolved solids, of which 75% are removed in the combined screw pressate and digester blow liquors. collected wastes are evaporated indirectly to 21% solids content and passed to the concentrated spent liquor system before incineration in a fluid-bed Dorr-Oliver reactor. A pollution-control system encompassing extensive white water reuse has been installed, in which reverse osmosis plays a significant part. The arrangement of sewers, recycled water flows, spill surge flow, and internal monitoring system is described and flowcharted. Technical data are given on discharged effluent characteristics (BOD, conductivity, soluble and suspended solids) and on costs and benefits of the installation. (See also W74-02273) (Brown-IPC)
W74-02283

COLOR REMOVAL FROM KRAFT PULP MILL EFFLUENTS BY MASSIVE LIME TREATMENT,
International Paper Co., Mobile Ala.
R. S. Wright.
In: TAPPI Environmental Conference, San Francisco, May 14-16, 1973. Preprinted Proceedings TAPPI, Atlanta, Ga., p 229-235, 1 tab, 3 fig.

Descriptors: *Treatment facilities, *Pulp wastes, *Bleaching wastes, *Color, *Lime, *Waste water treatment, Effluents, Costs, Sludge, Foaming, Chlorine, Efficiencies, Operating costs, Pulp and paper industry.
Identifiers: Kraft mills, Lime kilns, Wash waters, Kraft pulp, Alkaline extraction, Chemical recovery, Materials balance (or Mass balance), White liquor.

Massive treatment with lime according to the process developed by NCASI (National Council of the Pulp and Paper Industry for Air and Stream Improvement, Inc.) will remove over 90% of the color bodies from effluents of the final unbleached kraft pulp washing and of the alkaline extraction stage in bleach plants. These two effluents contain 65-75% of the total color load produced in the manufacture of bleached kraft pulp. Using all the lime normally available in a typical bleached kraft mill, about 14% of the total effluent can be treated. By treating the most highly colored effluents, 72% of the mill's total color load can be removed. The introduction of massive lime into the mill's liquor causticizing operation will dilute the white liquor and lower its concentration by about 15%. Hence the total liquor volume to be handled throughout a mill will increase and require chemical recovery and liquor preparation equipment of greater capacity. For a given pulp production, the fuel requirements of lime will increase by about 6.4%. Moreover, the carryover of organic compounds by the massive lime sludge into the cooking liquor system can intensify foam problems. Buildups of Cl and other materials have no apparent effect on the chemical recovery cycle. A typical 1000 ton/day kraft mill may spend ca. $1.80 per ton of bleached pulp for massive lime treatment of 4 million gal effluent without adverse effect on pulp bleachability or final product quality. (See also W74-02273) (Brown-IPC)

HYPERFILTRATION (REVERSE OSMOSIS) OF KRAFT PULP MILL AND BLEACH PLANT WASTES,
Oak Ridge National Lab., Tenn.
J. S. Johnson, Jr., R. E. Minturn, and G. E. Moore.
In: TAPPI Environmental Conference, San Francisco, May 14-16, 1973. Preprinted Proceedings TAPPI, Atlanta, Ga., p 237-243, 1 tab, 24 ref.

Descriptors: *Reverse osmosis, *Membranes, *Pulp wastes, *Bleaching wastes, Pressure, *Waste water treatment, Industrial wastes, Pulp and paper industry, Filtration, Temperature, Operation and maintenance, Membrane processes, Polymers.
Identifiers: Hyperfiltration, Cellulose acetate, Zirconium oxide, Wash waters, Salt rejection, Polyacrylates (or Acrylic resins), Process variables.

Various kraft mill effluents, including brown stock wash water, decker and screen room wastes, and bleach plant effluents, were subjected to high-pressure hyperfiltration through dynamic membranes of polyacrylate on a hydrous Zr (IV) oxide substrate; to moderate-pressure ultrafiltration using low-salt-rejection membranes comprising single layers of hydrous Zr (IV) oxide or of neutral organic polymers; and to low-pressure filtration. Dewatering of dilute black liquor was also attempted. Compared to conventional detachable cellulose acetate membranes, fluxes were considerably higher, and decontamination seemed adequate for reuse of many filtrates. Moreover, filtration could be conducted at the process temperature, and the membranes could be regenerated or removed and reformed in situ. (See also W74-02273) (Brown-IPC)
W74-02285

IMPROVING REVERSE OSMOSIS PERFORMANCE WITH DYNAMICALLY FORMED WOOD CHEMICAL MEMBRANES,
Institute of Paper Chemistry, Appleton, Wis.
I. K. Bansal, and A. J. Wiley.
In: TAPPI Environmental Conference, San Francisco, Calif., May 14-16, 1973. Preprinted Proceedings TAPPI, Atlanta, Ga., p 245-256, 7 tab, 4 fig, 5 ref.

Descriptors: *Reverse osmosis, *Membranes, *Lignins, Water purification, *Desalination processes, Membrane processes, Desalination, *Pulp wastes, Byproducts, *Waste water treatment, Operation and Maintenance.
Identifiers: Salt rejection, Lignosulfonates, Wash waters, Process variables, Cellulose acetate, Zirconium oxide.

A systematic study is reported of factors affecting the design and performance of dynamically formed reverse osmosis (R.O.) membranes comprising high-molecular-weight lignin layers (obtained from dilute pulping effluents) as secondary active surfaces on cellulose acetate substrates. These membranes have salt rejection properties significantly better than those of conventional cellulose acetate membranes, at only a small sacrifice in flux rate. They are readily removable by washing and rapidly renewable within ca. 1 hr. Commercial R.O. modules, in which the acetate membranes had suffered hydrolytic and other degradation during 1-4 years of intermittent operation, could be successfully reactivated by superposition of dynamic lignin membranes. Among four different ligniferous preparations, crude fractions of chemimechanical pulp wash water were found to give membranes of superior salt rejection (NaCl, ammonium and calcium lignosulfonates) althogh dynamic membranes from ultrafiltered high-molecular lignin fractions were generally better in other respects. Important parameters affecting the membranes include their formation speed and pressure, the pH of the ligniferous solution, and the reverse osmosis feed velocity. Comparative performance data are presented for lignin-based vs. polyelectrolytic membranes made of hydrous Zr (IV) oxide. Although dynamic membranes are short-lived (3-4 days), they are rather inexpensive to prepare. (See also W74-02273) (Brown-IPC)

THE EFFECTS ON RUNOFF, GROUNDWATER, AND LAND OF IRRIGATING WITH CATTLE MANURE SLURRIES,
Tennessee Univ., Knoxville. Dept. of Agricultural Engineering.
J. I. Sewell, and J. C. Barker.
Available from the National Technical Information Service as PB-226 070, $3.50 in paper copy, $1.45 in microfiche. Research Report No. 31, Tennessee Water Resources Research Center, Knoxville, October 4, 1973. 26 p, 7 fig, 4 tab, 3 ref. OWRR A-021-TENN (3).

Descriptors: *Farm wastes, *Cattle, *Water reuse, Waste disposal, Slurries, *Waste management, *Organic wastes, Irrigation, Water quality, Groundwater, Surface runoff, Nitrates, Bacteria, Southeast U.S., *Tennessee, Humid climates, Path of pollutants.

The manure slurry irrigation system receiving lot runoff has performed satisfactorily and has been durable. Careful management is required to maintain storage capacity for lot runoff while controlling surface runoff or irrigated slurry. Dilution water must sometimes be added to the storage tank to facilitate solids removal. Dry-matter contents of slurry up to about 4 percent did not appreciably reduce system discharge rates. Manure slurry apparently infiltrated into the shallow groundwater on the downslope side of the test area. Surface runoff from the manure-saturated area on occasions contained both total and fecal coliform median concentrations exceeding the maximum standard for raw surface water for public supplies. All median surface runoff nitrate nitrogen concentrations were within the permissible criteria. An average application rate of 5.55 tons of dry matter per acre per month applied in the form of dairy manure slurry presented no problems of solids accumulation on the ground surface. Field irrigation with the manure slurry resulted in a 98% reduction in the total solids content of surface runoff and groundwater compared with that of the slurry.
W74-02326

FOURTH ANNUAL REPORT, CITY OF CARBONDALE, ILLINOIS, WATER AND WASTEWATER TREATMENT.
Carbondale Dept. of Public Works, Ill.

1971. 91 P, 21 FIG, 19 TAB.

Descriptors: *Documentation, *Water treatment, *Water works, *Sewage treatment, *Sewage disposal, Costs, Operation and maintenance, Water supply, *Waste water treatment, Illinois, Municipal wastes, Annual costs.
Identifiers: *Carbondale (Illinois).

The operation data for water and wastewater treatment plants in Carbondale, Illinois are presented. Included are data on the city's water treatment plant and its three wastewater treatment plants. Data included for the water treatment plant are: (1) personnel, (2) a flow chart of operation, (3) description of treatment processes, (4) history of plant expansion and facilities, (5) hydraulic flow data, (6) peak raw water flows, (7) chemicals used--by weight and cost, (8) laboratory data, and (9) flow and miscellaneous cost data. Information provided for the wastewater treatment plants include: (1) personnel, (2) a flow chart of operation, (3) hydraulic flow data, (4) raw influent data, (5) final effluent data, (6) plant efficiency data, (7) secondary plant data, (8) miscellaneous operating and cost data, (9) sludge disposal data, and (10) general cost data. The City obtains its water from both a nearby reservoir and a lake. Plant capacity is 8.0 mgd, and a total of 1.38 billion gallons of potable water was sold in 1971 at a operation and maintenance cost of 15 cents per 1000 gallons. Secondary sewage treatment is provided at a operation and maintenance cost of 24 cents per 1000 gallons and 1.1 billion gallons were treated in 1971. Effluent is discharged to a nearby creek. (Poertner)
W74-02328

SURVEY OF METHODS OF TREATING WINE AND GRAPE WASTE WATER,
New York State Dept. of Environmental Conservation, Albany. Environmental Quality Research and Development Unit.
T. J. Tofflemire.
Technical Paper No. 25, February 1973. 24 p, 8 tab, 38 ref.

Descriptors: *Waste water treatment, *Reviews, *Industrial wastes, *Fruit crops, Organic wastes, Waste treatment, New York, Biological treatment, Anaerobic digestion, Activated sludge, Trickling filters, Sewage lagoons.
Identifiers: *Winery wastes, *Grape waste water.

Waste characteristics and methods of treatment of wine and grape wastewaters were examined. These wastes have a high BOD, are seasonally variant and have a tendency to become acidic and odorous upon standing. Methods of possible treatment include: (1) activated sludge, (2) aerated lagoons, (3) trickling filters, (4) rotating biological disks, (5) irrigation systems, (6) anaerobic processes, and (7) chemical processes. Five principal winery wastes are described as: (1) pomace, which consists of dewatered grape skins, seeds and pulp, (2) lees, which are bottom sediment that accumulate during wine storage, (3) stillage bottle washings, the residue that remains after alcohol has been distilled from the fermented wine, lees or pomace, (4) cooling water wastes, and (5) salt waters from ion-exhange processes. Other wastes include various sugars, organic acids, proteins, trace metals, alcohol and other miscellaneous substances. A major difficulty in the use of biological methods of treatment is the high ratio of BOD to both nitrogen and phosphorus. Pretreatment is a usual practice to remove solids by cycloning, screening, sedimentation, or filtration. Treatment with other wastes by conventional methods is possible if close operational control is practiced. Lagoons and irrigation are more commonly used, and these methods can be simple, dependable and offer high quality treatment. Rotating disks are a new method which appears to be efficient and easy to operate. (Poertner)
W74-02329

CITY OF AUSTIN, TEXAS, STUDY OF WASTEWATER COLLECTION SYSTEM: PHASE I.
Horner and Shifrin, Inc., St. Louis, Mo.

Prepared for City of Austin, Texas, October 1, 1969. 139 p, 13 fig, 13 tab.

Descriptors: *City planning, *Sewerage, *Comprehensive planning, *Urbanization, *Sewers, Future planning (Projected), Cost-benefit analysis, *Texas, Economics, Combined sewers, Sewers, Separated sewers, Water pollution control, Long-term planning, Urban planning.
Identifiers: *Austin (Texas).

Expected future growth of the City of Austin, Texas requires that a plan be developed to provide adequate sewers. Two major alternatives were studied in this first phase of an overall study. One plan involves the construction of a parallel system of relief sewers, while the other plan relies on a deep tunnel transversing the city with supplemental sewers. The second plan was recommended because it was estimated to be the most economical alternative. It was estimated that the equivalent annual cost of the deep tunnel plan would be about $300,000 cheaper than the first plan in 1985, $427,000 cheaper in 1990, and $477,000 cheaper in 1995. The crosstown tunnel would also be less of an inconvenience to property owners and traffic, although the feasibility of the deep tunnel must be checked by soil tests. In developing the two plans, the planned future development of the City was taken into account. Based on the master plan for land use and expected populations along with water consumption rates for the various types of use, the size and placement of sewers was computed. An important factor in the plan was the extent of future growth. It was predicted that by 2020 the city would reach its ultimate development and that the system would need to be adequate for the expected state of development at that time. No further increase in system capacity was considered necessary after the year 2020. (Poertner)

A WATER AND SEWER PLAN: GREENE COUNTY, GEORGIA.
Mayes, Sudderth and Etheredge, Inc., Atlanta, Ga.

Prepared for Northeast Georgia Area Planning and Development Commission, Athens, December 1968. 151 p, 23 fig, 16 tab, 3 append.

Descriptors: *Comprehensive planning, *Water supply, *Sewerage, *Regional development, Sewers, Water supply development, Data collections, Financing, *Georgia, Optimum development plans, Financial feasibility, Forecasting, *Rural area.
Identifiers: *Green County (Geo).

A water and sewer plan for Greene County was prepared as part of a comprehensive water and sewer plan for the Northeast Georgia Area Planning and Development Commission. Financed by a grant of the Farmers Home Administration of the USDA, this report is concerned with rural areas and communities with a population of less than 5,500. Four communities of more than 300 and less than 5,500 exist in this county which had a total 1966 population of 11,300. Predictions for 1990 population range from a high of 16,140 to a low of 3,505. With the higher figure favored. Green County is located about 75 miles east of Atlanta. It has about 48 inches of rainfall annually. Temperatures range from an average of 46F in winter to 80F in summer with an annual average of 63 degrees. Two major rivers and several smaller rivers and creeks exist in the County. Public water supply systems serve only three communities, with water derived from both surface and ground water sources. Due to the low population densities in the County, it is recommended that a county-wide system not be developed but, instead, that individual communities develop systems if desired. County ownership of all water systems may be practical to reduce operating costs and provide easier financing and expansion. Sewerage systems exist in only two communities. In one other community it might be economically feasible to establish a system. (Poertner)
W74-02334

A WATER AND SEWER PLAN: MORGAN COUNTY, GEORGIA.
Mayes, Sudderth and Etheredge, Inc., Atlanta, Ga.

Prepared for Northeast Georgia Area Planning and Development Commission, Athens, April 1969. 115 p, 16 fig, 13 tab, 3 append.

Descriptors: *Comprehensive planning, *Water supply, *Sewerage, *Regional development, Sewers, Water supply development, Data collections, Financing, *Georgia, Optimum development plans, Financial feasibility, Forecasting, *Rural areas.
Identifiers: *Morgan County (Geo).

A water and sewer plan for Morgan County was developed as part of a comprehensive water and sewer plan for the Northeast Georgia Area Planning and Development Commission. Financed by the Farmers Home Administration of the USDA, this study is concerned with communities less than 5,500 in population and rural areas. With a total county population of about 10,000 in 1960 (down from 20,000 in 1920), only two communities of population less than 5,500 and greater than 300 exist in the county. Total county population in 1990 is predicted at about 3,000, with the City of Madison having about 4,000 and the City of Rutledge, the next largest city, about 280. Located about 60 miles east of Atlanta, the area receives about 47 inches of rainfall annually and has a temperature range from an average of 46F in winter to about 80F in summer. Surface water supply includes several rivers and streams and is abundant. Domestic water is primarily from wells. The major water system serves the City of Madison, where 500,000 gpd are pumped from a creek. System capacity is not adequate and major improvements have been suggested to provide more water to existing users and to extend water service. Three other communities also have public water supplies which should be adequate until about 1985 or 1990. No recommendations for providing water supply to rural areas were made. Sewerage systems exist in two communities; one is adequate until 1990 and the other is presently inadequate. Upgrading of the latter is suggested and outlined. In other areas of the County, sewerage systems should not be needed until 1990. (Poertner)
W74-02335

A WATER AND SEWER PLAN: MADISON COUNTY, GEORGIA.
Mayes, Sudderth and Etheredge, Inc., Atlanta, Ga.

Prepared for Northeast Georgia Area Planning and Development Commission, Athens, February 1969. 146 p, 23 fig, 14 tab, 3 append.

Descriptors: *Comprehensive planning, *Water supply, *Sewerage, *Regional development, Sewers, Water supply development, Data collections, Financing, *Georgia, Optimum development plans, Financial feasibility, Forecasting, *Rural areas.
Identifiers: *Madison County (Geo).

A water and sewer plan for Madison County was prepared as part of a comprehensive water and sewer plan for the Northeast Georgia Area Planning and Development Commission region. Financed by the Farmers Home Administration of the USDA, the primary purpose was to develop recommendations for water sewer service to rural areas and incorporated communities having a population of less than 5,500. Madison County is located about 70 miles northeast of Atlanta. It covers about 180,000 acres and receives about 48 inches of rainfall a year. The average temperature is about 62F, varying from 44F in winter to 79F in summer. The 1966 County population was about 12,000 which is expected to increase to about 14,000 by 1990. Other population estimates indicate a possible decline to about 4,300 persons by 1990. Only very limited public water supply systems exist in seven communities having a combined 1960 population of 2,400. Most domestic water is from wells, and although some of these wells have gone dry in periods of extreme drought, no evidence of ground water shortage exists. A County water system is recommended. It would obtain water from the City of Athens in neighboring Clarke County. There are presently no sewerage systems in Madison County. Sewerage systems are recommended for four of the larger communities in a 5-year improvement program. No other sewerage systems are proposed before 1985. (Poertner)
W74-02336

A WATER AND SEWER PLAN: WALTON COUNTY, GEORGIA.
Mayes, Sudderth and Etheredge, Inc., Atlanta, Ga.

Prepared for Northeast Georgia Area Planning and Development Commission, Athens, May 1968. 139 p, 15 fig, 13 tab, 3 appendices.

Descriptors: *Comprehensive planning, *Water supply, *Sewerage, *Regional development, Sewers, Water supply development, Data collections, Financing, *Georgia, Optimum development plans, Financial feasibility, Forecasting, *Rural areas.
Identifiers: *Walton County (Geo).

A water and sewer plan for Walton County was developed as a part of a comprehensive water and sewer plan for the Northeast Georgia Area

Planning and Development Commission. With financial assistance of the Farmers Home Administration of the USDA, the study centered on communities with a population of 5,500 or less and on rural areas. From a total population of 21,700 in 1966, the County is expected to grow to about 28,245 by 1990. The County is located about 40 miles east of Atlanta and has an average rainfall of 48 inches per year. Temperatures range from an average of 45F in winter to 80F in summer. Water resources appear to be adequate with two major rivers and numerous minor streams present in the area. Most water for domestic use on farms is obtained from wells. Three cities have a population in excess of 300, with one over 5,500. Five public water supply systems exist in the County. It is recommended that a county-wide water supply system be developed along major throughfares with the primary water supply furnished by the City of Monroe, the largest city in the County which is located at the approximate center. This would provide water to areas presently not served by public supplies. It could also augment existing systems. Sewerage systems, where they exist, are inadequate. Recommended improvements are not scheduled until 1985, for financial reasons. Only the two largest communities under the 5,500 population limit have public sewerage systems. (Poertner)
W74-02337

REGIONAL WASTEWATER FACILITIES STUDY.
Anderson-Nichols and Co., Inc., Concord, N.H.

Prepared for Upper Valley Planning and Development Council, Lebanon, New Hampshire, July 1972. 185 p, 32 fig, 24 tab, 42 ref, 15 appendices.

Descriptors: *Comprehensive planning, *Planning, *Waste water treatment, Waste water disposal, *Regional analysis, Regional development, *New Hampshire, *Vermont, Economies, Sewage treatment, Sewage disposal, Costs, *Treatment facilities.

The projected growth of the Upper Valley Planning and Development Council region in Vermont and New Hampshire makes it important that planned development be used for efficient growth. Seven urban areas are identified, with an estimated 1975 population of 37,530, which is expected to grow to 98,380 by 2020. Existing flow rates of waste water are about 4.1 mgd; by 2020 the flow rate is expected to be about 10.7 mgd. Six alternative methods for providing waste water collection and treatment were considered. These included both regional and individual systems. Current methods include collection systems in 3 cities, with treatment plants serving one city and a section of another. Municipal collection and treatment will be needed in 5 communities. Two phases for construction are outlined. An intra-state approach is recommended with all discharges to the Connecticut River. It is estimated that New Hampshire will be able to qualify for 95 percent grants, while Vermont programs will be able to receive grants of 90 percent. Total annual cost is estimated at $342,336 for the 5 communities. (Poertner)
W74-02338

NORTHEAST GEORGIA AREA WATER AND SEWER SYSTEMS PLAN AND CAPITAL IMPROVEMENT PROGRAM.

THE IMPACT OF WATER POLLUTION ABATEMENT ON COMPETITION AND PRICING IN THE ALABAMA STEEL INDUSTRY,
Auburn Univ., Ala. Water Resources Research Inst.
G. R. Rowe, Jr., and H. B. Pickle.
Available from the National Technical Information Service as PB-226 260 $4.75 in paper copy, $1.45 in microfiche. Bulletin 12, 1973. 150 p, 17 fig, 32 tab, 46 ref, 2 append. OWRR C-3292 (no 3715) (2).

Descriptors: *Economic impact, *Industrial wastes, *Pollution abatement, Prices, Value, Marketing, *Alabama, Waste water treatment, *Treatment facilities, *Cost analysis.
Identifiers: *Steel industry.

The steel industry is faced with the need for rebuilding and modernization in addition to pollution abatement. All of these factors are important in determining the total economc impact of water pollution abatement in the steel industry and are examined. The economic impact of water pollution abatement in the steel industry was measured by deriving data to determine the following: (1) The cost to steel firms of installing effluent treatment facilities. (2) The per unit cost increase due to pollution abatement firms will pass on to industrial users. (3) Shifts in purchasing by steel users due to the resulting increased price. (4) The per unit price increase due to pollution abatement industrial users will pass on to ultimate consumers. The present standards for water pollution control will not cause sufficient harm, by themselves, to severely affect the industry as a whole. The economic analysis of the industry has shown, however, that the combination of expenditures for water pollution abatement, air pollution abatement, installation of new technology and capacity, servicing of debt load, and paying for rising production factor costs will combine to create a considerable strain on the financial resources of iron and steel producers in years to come.
W74-02437

WATER-TREATMENT-SLUDGE FILTRATION STUDIES,
Auburn Univ., Ala. Dept. of Civil Engineering.
J. F. Judkins, Jr.
Available from the National Technical Information Service as PB-226 224 $3.00 in paper copy, $1.45 in microfiche. Alabama Water Resources Research Institute , Auburn Bulletin 15, 1973. 36 p, 12 fig, 5 tab, 22 ref. OWRR A-024-ALA (5).

Descriptors: Water treatment, Sludge, *Filtration, *Waste water treatment, *Sludge treatment.
Identifiers: *Alum sludge, *Lime-Softening Sludge, Crystal Seeding.

Research was conducted to examine the filtration characteristics of alum and lime-softening sludges and to determine if the crystal seeding process could be used to improve the filterability of the sludges. Although calcium hardness had no significant affect on the filterability of lime-softening sludge, magnesium hardness concentration was found to have a definite affect on the filterability of the sludge. Sludges high in magnesium content were more difficult to filter than sludges low in magnesium. Crystal seeding was found to be effective in improving the filterability of both alum sludge and lime-softening sludge. The size of crystal seed dosage, the mixing rate and the number of sludge recycles appear to be important factors in the crystal seeding process.

IMPACT OF SEWAGE TREATMENT MODIFICATIONS ON WATER QUALITY OF A RESERVOIR,
Tennessee Univ., Knoxville. Dept. of Civil Engineering.
J. D. Womack, J. C. Burdick, III, and F. C. Larson.
Water Resources Bulletin, Vol 9, No 1, p 100-115, February 1973. 6 fig, 17 ref.

Descriptors: *Water quality, *Sewage treatment, *Waste water treatment, Economics, *Public health, *Tennessee, Reservoir, Activated sludge, Treatment facilities, Costs.
Identifiers: *Fort Loudoun Reservoir (Tenn).

As a result of several investigations, dating from 1966 to the present, a rather comprehensive surveillance of water quality conditions has been maintained in Fort Loudoun Reservoir on the Tennessee River near Knoxville, Tennessee. During the period covered by these investigations, the Knoxville Third Creek Sewage Treatment Plant was upgraded from a primary plant to a secondary (activated sludge) treatment plant. Comparison of the collected data is being undertaken to elucidate the impact of these modifications upon water quality conditions in the reservoir.Consideration is given to the improvements of water quality as related to the expenditure for modification of the treatment facilities. In addition, comment is directed toward the public health significance of the water quality conditions determined.

METHOD FOR REMOVING SUSPENDED SOLIDS FROM LIQUIDS,
Ecodyne Corp., Chicago, Ill. (assignee).
B. L. Goodman, and J. W. McKibben.
U. S. Patent No. 3,764,525, 6 p, 9 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 915, No 2, p 638, October 9, 1973.

Descriptors: *Patents, *Waste water treatment, *Suspended solids, Industrial wastes, Municipal wastes, *Filtration, Screens, Water pollution control, Water quality control.

An improved method is provided for removing suspended solids from liquids by using a screen having a coating of the solids. Waste liquid is delivered to the screen with a directional component across the screen surface and a directional component through the screen. The screen has openings that are large enough to pass a majority of the suspended solids, and the screen has the ability to hold a layer of the solids on the upstream side. The flow of the liquid is controlled so that the coating is formed and maintained on the screen, and serves as a filtration medium. There is also a liquid filtration zone having a screen separating it into influent and effluent zones. (Sinha-OEIS)
W74-02484

NITRIFICATION OF BOD-CONTAINING WATER,
Union Carbide Corp., New York. (Assignee).
M. J. Stankewich, Jr.
U. S. Patent No. 3,764,523, 9 p, 6 fig, 3 tab, 5 ref; Official Gazette of the United States Patent Office, Vol 915, No 2, p 638, October 9, 1973.

Descriptors: *Patents, Oxygen, Carbon, Nitrogen, *Aeration, *Nitrification, *Waste water treatment, *Biological treatment, Microorganisms, Pollution abatement, Water pollution control, Water quality control, *Biochemical oxygen demand.

A method is presented for treating BOD-containing water by aeration in contact with activated sludge, settling sludge from the aeration and recycling sludge to the aeration zone as the activated sludge wherein the carbon food in the water is bio-chemically oxidized with at least 50 percent oxygen by volume feed gas. A feed stream comprising at least in part the carbon-depleted effluent water is passed to a nitrification zone. Oxygen-depleted aeration gas of at least 20 percent oxygen content is released from the nitrification zone, and nitrifying sludge from the zone is settled and wasted at a rate such that sludge retention time in the nitrification zone is 3-20 days, with part being recycled as the nitrifying sludge recycle. (Sinha-OEIS)
W74-02485

METHOD AND APPARATUS FOR ELECTROLYTIC TREATMENT OF SEWAGE,
Pacific Engineering and Production Co. of Nevada, Henderson. (assignee).
B. B. Halker.
U. S. Patent No. 3,764,500, 7 p, 15 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 915, No 2, p 632, October 9, 1973.

Descriptors: *Patents, *Sewage treatment, *Electrolysis, *Disinfection, Odors, Color, *Waste water treatment, Pollution abatement, Water pollution control, Water quality control, Chemical oxygen demand, Biochemical oxygen demand.

The method and apparatus comprises the judicious application, at certain strategic locations in a sewage treatment plant, of electrolytic treatment of a portion or all of the stream. The apparatus includes one or more electrolytic assemblies employing anodes formed of a coating of lead dioxide on a substrate of graphite or titanium, and preferably includes a hollow, cylindrical metal tube which forms the cathode and with the anode contained therein and in the form of a cylindrical member whose outer surface is equidistantly spaced from the inner surface of the cathode container. Electrolyte flows through the assembly from an inlet conduit near the bottom to an outlet conduit near the top, and electrical connections are made to the exterior cathode can and to a portion of the anobe substrate which protrudes from the top of the assembly. The electrolytic treatment of all or a portion of the stream takes place to supplement the customary sewage treatment method. (Sinha-OEIS)
W74-02486

PROCESS FOR REMOVAL OF CONTAMINANTS FROM WASTES,
K. Okubo, and A. Ueno.
U. S. Patent No. 3,764,499, 5 p, 10 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 915, No 2, p 632, October 9, 1973.

Descriptors: *Patents, *Waste water treatment, *Metals, Copper, Zinc, Silver, Chromium, Cadmium, Pollution abatement, Water pollution control, Water quality control, Electrodes, *Electrolysis.

An electrolytic process is discussed for the removal of such contaminants as cyanides, and metals such as copper, zinc, silver, chromium, and cadmium. An electrolytic cell is partitioned by a membrane into at least two electrolytic chambers which are filled with electric conductors and positive and negative major electrodes forming an anode chamber and a cathode chamber in abutting relation through the membrane. The rinse water is selectively led into the anode or cathode chamber to effect the reduction and/or oxidation with decomposition of the toxic metals and cyanides so that the pollution concentration of the rinse water is lowered. The rinse water with less pollution is then moved through the membrane into the cathode or the anode chamber to bring a further reduction and/or oxidation with decomposition of the residual metals and cyanides. (Sinha-OEIS)
W74-02487

SEWAGE TREATMENT APPARATUS,
D. E. Owens.
U. S. Patent No. 3,764,011, 3 p, 6 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 915, No 2, p 519, October 9, 1973.

Descriptors: *Patents, *Sewage treatment, Pollution abatement, *Aeration, *Chlorination, Water pollution control, *Waste water treatment.
Identifiers: Portable equipment, Gravity flow.

A portable self-contained sewage treatment plant particularly designed to meet the needs of small sub-divisions contains within a single tank body an aeration chamber, a settlement chamber and a chlorination chamber. The plant features an aeration system which also serves to power jets for the return of heavy and light solids from the settlement chamber into the aeration chamber. A floating skimmer in the settlement chamber removes light solids from the surface of the liquid for delivery to one return jet. Liquid from the settlement chamber flows into the chlorination chamber and clear effluent is discharged from the latter. (Sinha-OEIS)

REGIONAL WATER, SEWAGE, AND SOLID WASTE DISTRICTS.

Ind. Ann. Stat. secs 27-2801 thru 27-2844 (1970).

Descriptors: *Legislation, *Sewage systems, *Indiana, *Solid wastes, Ultimate disposal, Water quality, Water pollution sources, Disposal, Legal aspects, Water quality control, Water resources development, Water districts.

Indiana Annotated Statutes deal with regional water, sewage, and solid waste districts. The statutes provide that any area situated in any unincorporated part of one or more contiguous counties or in one or more municipal corporations, or both, may be organized as a regional water, sewage and solid waste district in the manner and subject to the conditions provided in the act in order to provide a water supply for domestic, industrial and public use to users within and without the district. Moreover, they may be established to provide for the collection and disposal of storm and sanitary sewage and other liquid waste within and without the district and to provide for the collection and disposal of solids waste and refuse within and without the district. Following the purposes and various definitions, the statutes provide for hearings, petitioning procedures, organization of the districts, the applicability of eminent domain, revenue bonds, special assessments, referendums, and various other procedures to provide water supply systems and sewerage systems. ELECTROCHEMICAL FLOTATION CONCEPT FOR REMOVING OIL FROM WATER,
Lockheed Aircraft Service Co., Ontario, Calif.
Q. H. McKenna, H. H. Helber, L. M. Carrell, and R. F. Tobias.
Available from NTIS as AD-760 056. Final Report No. 734305.2/4, prepared for Coast Guard Office of Research and Development, January 1973. 131 p, 20 fig, 31 tab, 7 ref. DOT-CG-24288-A.

Descriptors: Pollution sources, *Waste water treatment, *Oily water, Bubbles, *Separation techniques, Costs, *Pollution abatement, *Water quality control.
Identifiers: Electrochemical flotation, Bilge water, Flotation, Water pollution prevention.

A study was undertaken to determine the feasibility of an electrochemical flotation system for separating oil from bilge water. This system involves flotation, using electrolytically-produced micro-gas bubbles, subsequent to coagulation and/or adsorption of oily impurities in the water. Initial electroflotation tests were conducted in batch modules to determine the chemical treatment necessary to achieve the desired separation of the entire spectrum of oil-brackish water combinations. Addition of NaOH to adjust the pH to approximately 10 along with 10-15 ppm of anionic polyelectrolyte was the only pretreatment necessary for all oily waters tested. Processing of real bilge waters as well as simulated bilge and ballast waters in the continuous flow modules produced optically clear effluent waters with less than 10 ppm residual oil. Emulsified oil concentrations in the influent stream were as high as 3000-4000 ppm. The operating temperature of the system is restricted to temperatures below 110F. Ship motions of 10 deg pitch and 15 deg roll up to a frequency of 6 cycles per minute did not interfere with the normal operation of the system. Pilot plant data were used to estimate the costs of systems with capacities of 30, 100, and 1000 gpm. The total capital costs are $31,320, $80,500 and $600,000, respectively, while the total operating cost per 1000 gallons is $0.77. (Sinha-OEIS)

In: TAPPI Environmental Conference, San Francisco, May 14-16, 1973. Preprinted Proceedings TAPPI, Atlanta, Ga., p 145-151, 4 tab, 25 ref.

Descriptors: *Sludge treatment, *Byproducts, *Pulp wastes, *Proteins, *Fermentation, *Actinomycetes, Bacteria, Cellulose, Thermophilic bacteria, Foods, Pulp and paper industry, Enzymes, Food processing industry, Microorganisms, *Waste water treatment, Industrial wastes.
Identifiers: Thermonospora fusca.

Thermonospora fusca is a strongly cellulolytic thermophilic filamentous actinomycete which grows well on various pulps and pulp mill fines (fine fibers) of low lignin contents. Fermentation of such materials with this bacterium at 55 C achieves a considerable reduction in their volume while producing a readily harvestable high-value protein. Thermophilic fermentations of paper mill effluent sludges might be used in waste disposal systems or for production of animal or poultry feed protein. Extracellular enzymes in the spent fermentation broth are byproducts that could find new uses in the food and beverage industries or in the paper industry itself for stock preparation. HYDROGEOLOGIC ASPECTS OF A PROPOSED SANITARY LANDFILL NEAR OLD TAMPA BAY, FLORIDA,
Geological Survey, Tallahassee, Fla.
R. N. Cherry, and D. P. Brown.
Open-file report 73015, 1973. 25 p, 8 fig, 3 tab, 9 ref.

Descriptors: Baseline studies, *Landfills, *Hydrogeology, *Groundwater movement, *Florida, Aquifers, Aquifer characteristics, Waste disposal, Garbage dumps, Planning, Sanitary engineering, Environmental control, Water pollution control, Environmental sanitation, Data collections, Evaluation.
Identifiers: *Clearwater (Fla).

The proposed sanitary landfill site for the city of Clearwater is in east-central Pinellas County near Old Tampa Bay. The area of the site is about 320 acres. The site is about 50 feet above mean sea level and is partly drained by two unnamed streams. One stream is a tributary of the Lake Tarpon outfall canal; the other stream, a tributary of Bishop Creek, drains into the north end of Old Tampa Bay. The two aquifers in the area are: a shallow aquifer, which is composed of sand containing a limestone zone, and the Floridan aquifer, which is composed of limestone. At the site of the proposed landfill, the two aquifers are separated by an average of 35 feet of clay that forms a confining layer of low vertical permeability. The head difference between the shallow and Floridan aquifers is 40 feet, and the rate of vertical movement within the proposed landfill site from the shallow aquifer through the clay layer to the underlying Floridan aquifer is estimated to be 32,000 gpm in an area of 320 acres. The site could be made hydrologically favorable for a sanitary landfill if some precautions are taken. A perimeter canal could intercept water leaving the site. Also, maintaining a monitoring system would allow early detection of possible movement of contaminated water. (Woodard-USGS)

SIXTEEN YEARS OF WATER FLUORIDATION IN THE NETHERLANDS AND ITS INFLUENCE ON DENTAL DECAY,
Utrecht Rijksuniversiteit (Netherlands). Microbiology Lab.
G. W. Kwant.
Fluoride, Vol 6, No 1, p 49-56, 1973, Illus.
Identifiers: *Dental decay, *Fluoridation, *Netherlands, Historical studies, Water treatment, Public health.

For the Dutch fluoridation project, the towns of Culemborg and Tiel were selected after sociological screening. Tiel was fluoridated up to 1.1 mg/l in March 1953, and compared to Culemborg with a fluoride concentration of 0.1 ppm in its drinking water. In this experiment, caries were diagnosed in different sites. This method permitted a better insight into the total number of cavities in a dentition. It also showed that fluoridation did not have the same effect on all tooth surfaces. Caries of the proximal surfaces was diagnosed with the aid of X-rays, whereas all other sites were evaluated clinically. The main study groups, consisting of children 11-15 yr-old, were examined every second year. Each age class in these groups consisted of about 70 boys and 70 girls. All these children were born and had resided either in Tiel or in Culemborg all their lives. During the course of these 16 yrs, the caries frequency in Culemborg increased whereas it decreased in Tiel. (See also W74-02230)--Copyright 1973, Biological Abstracts, Inc.
W74-02229

COMMENTS ON THE PAPER BY G. W. KWANT 'SIXTEEN YEARS OF WATER FLUORIDATION IN THE NETHERLANDS AND ITS INFLUENCE ON DENTAL DECAY,'
Institute of Environmental Research, Graz (Austria).
R. Ziegelbecker, and H. M. Thomson.
Fluoride, Vol 6, No 1, p 57-63, 1973, Illus.
Identifiers: Child, Decay, Dental, Fluoridation, G, Kwant, Netherlands, Paper, W, Water, Years.

The article by G. W. Kwant which purports to prove fluoridation a success in the Netherlands exhibits serious shortcomings. They pertain to the following: selection of an adequate control city; proper sampling of the children; lack of essential data; and faulty interpretation of the results. Factors other than fluoride were given no consideration nor were the long-term effects on older children and adults evaluated; these are requisites for conclusions regarding the total dental effects. (See also W74-02229)--Copyright 1973, Biological Abstracts, Inc.

THE REMOVAL OF ORGANIC COMPOUNDS IN THE PRODUCTION OF POTABLE WATER,
Water Research Association, Marlow (England).
R. B. Gauntlett, and R. F. Packham.
Chemistry and Industry, No 17, p 812-817, September 1, 1973. 1 tab, 5 fig, 19 ref.

Descriptors: *Water treatment, *Potable water, Odor, Taste, Color, *Coagulation, *Adsorption, *Oxidation, *Filtration, *Chlorination, Ozone, Chlorine, Activated carbon, Humic acids, Fulvic acids, Phenols, Oil, Hydrocarbons, Chlorine compounds, Manganese, Iron, Water treatment, Surface waters.
Identifiers: Chlorine dioxide, Potassium permanganate, Precipitation (Chemical), Oxidants, Manganese dioxide, Manganese compounds.

Surface water constituents contributing to objectionable taste, odor, and color include mainly humic and fulvic acids leached from peaty and other soils. Pollutants having low odor thresholds include diesel oil and chlorinated phenols. Water purification methods for public consumption involve mainly chemical precipitation, using aluminum sulfate or similar coagulants; adsorption, usually on activated carbon; and/or oxidation by means of chlorine, chlorine dioxide, ozone, or potassium permanganate. More than one of these processess may be needed to remove all objectionable material. Principles for selection of the best sequence must consider possible antagonism between treatment methods, as well as the multifunctionality of any one process. Thus, activated carbon beds should be used after filtration, but before chlorination, since they gain efficiency by prolonged contact, but are cloggingprone and also effective dechlorinizers. The effluent from adsorption columns, which provide sites for bacterial growth, should be disinfected. Permanganate must be added before coagulants, so that any manganese dioxide formed is coprecipitated. Ozonization should usually be the final step for economic reasons and to avoid oxidative degradation of adsorbed organics into less easily removable products. Other oxidants are also best applied last, except for removal of Fe or Mn. Local circumstances may dictate deviations from these rules. (Brown-IPC)

CONCENTRATION OF ENTEROVIRUSES FROM LARGE VOLUMES OF WATER,
Baylor Coll. of Medicine, Houston, Tex. Dept. of Virology and Epidemiology.
M. D. Sobsey, C. Wallis, M. Henderson, and J. L. Melnick.
Applied Microbiology, Vol 26, No 4, p 529-534, October 1973. 4 tab, 1 fig, 11 ref.

Descriptors: *Public health, *Potable water, *Viruses, *Water analysis, *Water treatment, *Aquatic microorganisms, Filtration, Adsorption, Monitoring, Membrane processes, Filters, Freshwater.
Identifiers: Poliomyelitis, Cellulose nitrate, Fiberglass, Epoxy resins.

Upon acidification of large volumes of clean water, viruses can be efficiently absorbed to epoxy-fiberglass and cellulose nitrate filters in the absence of exogenously added salts. Based on this finding, a modified virus-concentrating system for the monitoring of clean waters was developed. The water to be tested is acidified by injection of 1N HCl and passed through a fiberglass cartridge depth filter and an epoxy-fiberglass membrane filter in series. The adsorbed viruses are then eluted with 1 liter of eluent at pH 11.5 and reconcentrated by adosorption on and elution from a series of small epoxy-fiberglass filters. Using this method, small quantities of polio virus in 100-gal volumes (378.5 liter) of tapwater were concentrated nearly 40,000-fold with an average virus recovery efficiency of 77%. (Brown-IPC)

OPTIMIZATION OF INDUSTRIAL SYSTEMS WITH THE SEPARABLE PROGRAMMING AND THE GENERALIZED REDUCED GRADIENT METHODS,
Kansas State Univ., Manhattan. Dept. of Industrial Engineering.
J. L. Williams.
Available from the National Technical Information Service as PB-226 187, $15.75 in paper copy, $1.45 in microfiche. M.S. Thesis, 1972. 265 p, 44 fig, 5 tab, 48 ref. OWRR A-038-KAN (4). 14-31-0001-3216.

Descriptors: *Optimization, *Computer programs, Model studies, Water quality, *Industries, Mathematical studies.
Identifiers: *Water quality control systems, *Geometric programming, *Gradient methods, Nonlinear programming.

Two nonlinear programming methods and their application to industrial systems are reviewed. Separable programming is described and exemplified. The same procedure is presented that is used in the separable programming subroutine of the Mathematical Programming System/360 (MPS/360). A supplemental FORTRAN program for assisting the usage of MPS/360 when solving separable programming problems is presented. An interesting application of separable programming to solve the geometric programming dual problem with N-degrees of difficulty is also exhibited. The second technique considered is the generalized reduced gradient method. The mathematical theory is presented and numerical examples are used to exemplify it. Its application via the GREG program is evaluated, and numerous computer examples are worked. The study is concluded with the application of the technique to optimize a water quality control model.

Identifiers: Economics, *Environmental protection, Sewage, *Cost analysis, *Pollution-costs (Public).

Industrial firms, public bodies and households frequently save expenditure e.g., for sewage purification, by dumping refuse into the environment. The community has to bear costs which arise through private activities. Pollutors should pay a sum equivalent to the estimated cost of the damage caused. The economic damage must be determined by means of utilization cost analysis.--Copyright 1973, Biological Abstracts, Inc.

APPARATUS FOR CONFINING FLOATING POLLUTANTS,
E. H. Rolfson.
U. S. Patent No. 3,764,015, 3 p, 8 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 915, No 2, p 520, October 9, 1973.

Descriptors: *Patents, *Oil spills, *Oil pollution, Water quality control, *Pollution abatement, Equipment, *Separation techniques.

A sizeable number of substantially rectangular buoyant lightweight and fire-proof platforms are provided which are connected in series and adapted to be towed to the site while flat, made to surround the area from which the pollutants are to be removed, and then rotated approximately 180 degrees on their axes to assume a substantially vertical position. While in vertical position these substantially rectangular platforms are adjustable as to the depth to which they extend. After the pollutants have been removed to a satisfactory extent, the platforms are rotated on their longitudinal axes to assume their initial flat position, and then towed away while still serially connected as before. Means for effecting the rotational movement of each of the substantially rectangular platforms is provided by one or more elongated tanks which extend transversely of the platforms, and which are divided by an airtight partition into an airtight flotation compartment and an airtight ballast compartment, together with means for adjusting the quantity of water in each of the ballast tanks; also

for adjusting the depth to which the platforms extend into the water when in their vertical positions. (Sinha-OEIS)
W74-02488

OIL SKIMMING APPARATUS,
Cities Service Oil Co., Tulsa, Okla. (Assignee).
J. W. Penton.
U.S. Patent No. 3,762,556, 4 p, 2 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 915, No 1, p 161, October 2, 1973.

Descriptors: *Patents, *Skimming, *Oil spills, *Oil pollution, Separation techniques, Equipment, Water pollution control, Water quality control, *Pollution abatement.

An oil skimming apparatus is comprised of a floating housing placed within a body of water, for example a settling pond, which has an oil slick. The housing includes multiple, interconnected hinged gates to provide weirs over which the oil slick can spill into an oil sump within the housing. Oil which accumulates within the housing is pumped out of the sump into a storage vessel. The interconnected hinged gates are counterbalanced to hold them in a normally upright position, but as oil is pumped from the housing the interconnected gates fall inwardly into the housing at a slight angle so that oil spills over the gates into the sump while also prevent excessive inflow of water. The housing has multiple compartments defined by the gates. Water is removed from the compartments through piping which communicates with the lower region of each compartment. (Sinha-OEIS)
W74-02491

UNDERWATER TANKER BALLAST WATER/OIL SEPARATION,
Chicago Bridge and Iron Co., Oak Brook, Ill. (Assignee).
J. S. McCabe.
U.S. Patent No 3,762,548, 3 p, 3 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 915, No 1, p 158, October 2, 1973.

Descriptors: *Patents, *Oil pollution, *Separation techniques, Gravity, *Pollution abatement, Water quality control, Water pollution control.
Identifiers: Ballast.

Ballast water contaminated with entrained or emulsified oil is transferred to an underwater disengagement zone operating on the water displacement principle, as exemplified by an underwater storage tank having an upward convex shell with an opening in its bottom through which water can move into and out of the shell. In the disengagement zone, the ballast is separated under the influence of gravity, into separate oil and water phases. The oil rises to a point which it can be recovered. The separated water flows out of the open bottom of the zone into the body of water. (Sinha-OEIS)
W74-02492

FLOATING WATER JET FOR OIL SLICK CONTROL,
Department of the Navy, Washington, D.C.
D. J. Graham.
U. S. Patent No. 3,762,169, 3 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 915, No 1, p 61, October 2, 1973.

Descriptors: *Patents, Separation techniques, *Oil spills, *Oil pollution, *Pollution abatement, Water pollution control, Water quality control.

An oil containment boom comprises a flexible rubber hose having attached floats placed at spaced intervals. Water jets are connected to the hose between the floats and counterweights are added to balance the unit. A water pump provides low pressure water to a hose which is sprayed through the jets against the oil slick, forcing it to the recovery mechanism. (Sinha, OEIS)
W74-02494

WATER POLLUTION CONTROL,
R. L. Pardee.
U. S. Patent No. 3,762,168, 3 p, 3 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 915, No 1, p 61, October 2, 1973.

Descriptors: *Patents, Barriers, *Skimming, *Flotsam, *Oil pollution, *Oil spills, *Pollution abatement, Water quality control, Water pollution control, Equipment.

The skimmer consists of a barrier which can be placed at an acute angle to the flow of water to divert an upper portion of the water striking it. The debris (pollutants) are directed to a collecting area. The barrier may also be used to protect an offshore working area, such as an oil well rig. The barrier is mounted so that it will automatically rise and fall with the changing level of the waterway. The barrier is formed with vertical loops or sleeves at its opposite ends to receive upright posts rigidly supported. Suitable bearings may be interposed between the posts and loops to permit free vertical movement of the barrier. (Sinha-OEIS)

CHALLENGES TO FEDERALISM: STATE LEGISLATION CONCERNING MARINE OIL POLLUTION,
Oregon Univ., Eugene. School of Law.
P. N. Swan.
Ecology Law Quarterly, Vol 2, No 3, p 437-470, Summer 1972. 219 ref.

Descriptors: *Oil pollution, *Water pollution, *Florida, *Legislation, Judicial decisions, Legal aspects, Oil industry, Law enforcement, Oil wastes, Water pollution sources, Disasters, Chemical wastes, Water quality.

The recent case decision holding a state statute invalid due to the inability of the states to legislate within admiralty jurisdiction is criticized, arguing that this principle is not constitutionally mandated. Other challenges to the statute--that it violates the commerce clause, or is prempted by the Federal Water Quality Improvement Act--are also discussed. The preventive provisions of the statute should be upheld by the Supreme Court when it hears the case on appeal. The state statute was designed to serve five basic purposes: to confer licensing authority; to regulate the deliverance and transference of hazardous materials, including oil and petroleum products; to establish a compensation and control expense fund; to make terminal operations and carriers strictly liable for pollution damage; and to make them responsible for removing escaped pollutants. Until the federal government takes greater initiative in the areas of pollution prevention and clean up, state remedies such as those under the statute in question should be held valid. GROUNDWATER POLLUTION IN THE WESTERN STATES--PRIVATE REMEDIES AND FEDERAL AND STATE LEGISLATION,
S. J. Nixon.
Land and Water Law Review, Vol 8, p 537-564, 1973. 193 ref.

Descriptors: *Water pollution, *Groundwater, *Remedies, Water Quality Act, Federal Water Pollution Control Act, Pollution abatement, Legal aspects, Legislation, Water quality control.
Identifiers: Water Pollution Control Act Amendments of 1972.

Remedies against groundwater pollution on the private, state, and federal levels have been clearly established by precedent as well as recent legislation. Private remedies have been stressed by both federal and state legislation. State groundwater quality standards, which should be established, may simplify the burden of proof for the private litigant and the state enforcement authority. Regulative legislation as well as preventative and compensatory private action are discussed. Private remedies including private nuisance, public nuisance, negligence, other general remedies and defenses are discribed. Also considered are state legislation and federal legislation, including legislative history. (Sears-Florida)

MICHIGAN STATE WATER POLLUTION CONTROL PLAN.
Michigan Water Resources Commission, Lansing.

June 1973. 125 p, 9 tab, 4 chart.

Descriptors: *Water quality control, *Water quality act, *Michigan, Water control, Water resource development, Water quality standards, Pollution standards, Water permits, Legal aspects, Administration, Governments, Comprehensive planning, Water management (Applied), Water policy.

Michigan's official water pollution control plan for fiscal year 1974 is presented. This document represents the third step in the planning process developed in response to the federal water quality act. The first step consisted of a continuing planning process followed by a second document on the state's water strategy for fiscal year 1974. This third document includes plans for monitoring, issuing permits for pollution discharge, enforcement, training and administration of the state's water resources and supply. An output summary and resource need chart for the state are included. (Daniels-Florida)

PUBLIC WATER SUPPLIES--CHLORINATION.
Illinois State Environmental Protection Agency, Springfield. Div. of Public Water Supplies.

Technical Release No. 10-2, September 14, 1972. 5 p, 6 fig.

Descriptors: *Illinois, *Public health, *Water supply, *Water treatment, *Water quality control, *Chlorination, Chemicals, Engineering, Pollution abatement, Surface waters, Groundwater, Limestone, Sanitary engineering.

Treatment by continuous and adequate chlorination is required by the State of Illinois in the following instances: when the supply is obtained from a surface source; when the supply is exposed to contamination during the course of treatment; when groundwater sources are or may become contaminated; or where local conditions, i.e. flooding indicates that a factor of safety is desirable to guarantee the quality of the supply. Chlorination is not considered as a substitute for a proved sanitation practice. Two major factors are considered with respect to chlorinator capacities. The first is basic requirements, meaning sufficient capacity available to satisfy immediate chlorine demand and give a true residual of at least triple that indicated by the accompanying set of curves for free or combined chlorination. Certain local conditions are to be considered such as pH, water temperature, contact time, presence of nitrogenous compounds, etc. The second factor is normal design requirements. Other areas covered are: chlorine feed equipment, spare chlorinator parts, location of equipment and parts, chlorine gas masks, weighing scales, and residual chlorine testing kit. (Napolitano-Florida)
W74-02538

PUBLIC WATER SUPPLIES.
Illinois State Environmental Protection Agency, Springfield. Div. of Public Water Supplies.

Technical Release No. 10-1, September 14, 1972. 2 p.

Descriptors: *Illinois, *Protection, *Pollution abatement, Pollutant identification, Technical writing, Septic tanks, Cesspools, Sewers, Seepage, Ponds, Subsurface waters, Oil pollution, Floodwater, Wells, Reservoir sites, Filters.

The Illinois Environmental Protection Agency has promulgated specific minimum distances between certain sources of contamination and public water supply structures. The sources of contamination considered are: privies, septic tanks, cesspools; sewers (storm and sanitary); subsurface seepage-disposal lines; pits or ponds receiving surface waters, oil, grease, etc; and flood waters. Structures to be protected are: wells, clear-water reservoirs, gravity filters, section lines, iron-removal and chlorine reaction basins, and wet-salt-storage basins. A chart is included specifying the distance from each source of contamination. The minimum distances are given for clay and loam soils with the stipulation that when structures are to be located in more pervious soils, such as sand or gravel, the minimum distances are to be increased accordingly. Caution is urged regarding the location of structures in areas where creviced limestone may be disturbed. If structures requiring isolation from contamination are to be located in such areas, advice from the agency should be sought. (Napolitano-Florida)

HYDROCARBON-OXIDIZING BACTERIA AND THEIR POSSIBLE USE AS CONTROLLING AGENTS OF OIL POLLUTION IN THE OCEAN,
Naval Weapons Center, China Lake, Calif. Research Dept.
G. Soli.
Available from NTIS, Springfield, Va. 22151 AD-746 163. Price $3.00 printed copy; $1.45 microfiche. Technical Report No 2, July 1972. 18 p, 2 fig, 4 tab, 4 ref. ONR Task No NR 137-887.

Descriptors: *Oil pollution, *Oily water, *Pollution abatement, *Biodegradation, *Organic compounds, Bacteria, Microorganisms, Chemical reactions, Biological communities, Biochemistry, Data collections, Oil spills, Marine bacteria, Water pollution control, Methodology, Evaluation.

Degradation of petroleum hydrocarbons by marine bacteria is a subject of increasing interest due to the fact that these microorganisms are responsible for the dissimilation of oil which enters natural waters as a contaminant. Attempts were made at characterizing various bacterial strains, isolated from marine environments, on the basis of their ability to attack groups of hydrocarbons, rather than through a conventional bacteriological key. Because hydrocarbons are not always completely oxidized to CO2 and water, but rather degraded to intermediate products such as the corresponding acids or alcohols, a study of the effect of degraded and undegraded crude oil on marine phytoplankton organisms was also initiated. All the bacterial strains investigated demonstrated the ability to digest normal paraffins, with the exception of one strain which attacks preferentially aromatic hydrocarbons. Some of the strains were able to oxidize all three isoparaffins in the mixture, as well as cycloparaffins and aromatics. The results are tabulated. (Woodard-USGS)

FEASIBILITY STUDY OF THE SAND SINKING METHOD OF COMBATTING A MAJOR OIL SPILL IN THE OCEAN ENVIRONMENT,
Office of the Chief of Engineers (Army), Washington, D.C.
L. Tobias, L. J. Mauriello, and G. M. Watts.
Available from NTIS as AD-742 949. Final Report prepared for Coast Guard Office of Research and Development, December 1971. 35 p, 13 fig, 1 append. MIPR-Z-70099-9-93403.

Descriptors: *Feasibility studies, *Oil spills, *Pollution sources, Chemical reactions, Oceans, *Water quality control, *Pollution abatement, Environmental effects, *Separation techniques.
Identifiers: *Sand sink method.

The objective was to determine the feasibility of the sand sink method developed by Shell Research in combatting a major oil spill in the ocean environment. The sand sink method sinks floating oil by spraying the oil slick with sand previously made oleophilic by a chemical treatment. The technique contemplates that the sand would be obtained from the sea bottom in the nearshore coastal areas by use of a trailing suction hopper dredge. The dredge with its cargo of sand would then proceed to the site of the oil spill where the sand would be converted to a slurry by the addition of sea water by the dredge pumps. After injection of the chemical into the flowline, the mixture of treated sand would be sprayed over the floating oil by means of a boom and nozzle system extending over the sides of the vessel. The oil wet properties of the treated sand grains would attract the oil in the slick and the oil coated sand grains would sink to the bottom. Laboratory tests were conducted to deter-

mine optimum chemicals and sand to oil ratios for maximum effectiveness for the types of sands existing along the coastal areas of the United States. Different types of oils were investigated as well as different sand gradations to develop the effectiveness parameters. Tables and graphs were developed for different oils, sand ratios and chemical treatment concentrations. Studies were made of the modifications necessary to adapt the Corps Hopper Dredge GOETHALS for a sand sink capability. The investigation suggests that the sand sink method is a feasible technique but its use would depend on consideration of the relative values of environmental factors. (Sinha-OEIS)
W74-02635

INVESTIGATION OF SORBENTS FOR REMOVING OIL SPILLS FROM WATERS,
Naval Ship Research and Development Center, Annapolis, Md.
P. Schatzberg.
Available from NTIS as AD-742 950. Final Report No. 724110.1/2/1, prepared for Coast Guard Office of Research and Development, November 1971. 48 p, 15 fig, 20 tab, 14 ref, 11 append. MIPR-Z-70099-0-00584.

Descriptors: *Oil spills, Separation techniques, *Pollution sources, *Pollution abatement, Water quality control.
Identifiers: Polymeric hydrocarbon, Polymeric foam, Water pollution prevention, *Sorbents, Petroleum products.

Laboratory methods have been developed to evaluate floating sorbent materials for removing oil spilled on water. These methods were applied to 49 different sorbent materials belonging to five categories: inorganic, natural organic, polymeric foam, polymeric hydrocarbon, and miscellaneous products. Some of the properties evaluated were oil and water sorption capacity, oil retention, buoyancy retention with and without absorbed oil, effect of petroleum product variation, sorbent/oil coherence, and reusability. Of all the materials evaluated the polymeric foam and the polymeric hydrocarbon products showed the best overall properties for removing oil spilled on water. Of these two groups, the resilient polyurethane foams and the polypropylene fibers were the best materials. The inorganic, the natural organic, and the miscellaneous products showed a relatively low capacity for oil and a relatively poor buoyancy retention. (Sinha-OEIS)
W74-02636

INSECT PEST MANAGEMENT IN COASTAL AND ESTUARINE HABITATS,
North Carolina State Univ., Raleigh. Dept. of Entomology.
R. C. Axtell, and K. L. Knight.
Available from NTIS as COM-72-10453. Sea Grant Publication, Progress Report, December 1971. 56 p, 3 fig, 3 tab. SG 2-35178 and ES00069.

Descriptors: *Insects, Coasts, Estuaries, Diseases, Mosquitoes, Environmental effects, *Aquatic insects, *Pollution abatement, *North Carolina, Insect control, *Marsh management, *Marsh plants, Aquatic habitats, Ecosystems.
Identifiers: Flies, Tabanidae, Juncus, Spartina, *Pest management.

Areas of Carteret Co., North Carolina are being used as a model to develop the data required for a pest management program in a coastal and estuarine situation. Initially it is necessary to determine: (1) What species of pests are present. (2) Which ones are of economic importance. (3) Where do they breed. and (4) What factors regulate their abundance. Research has been in progress (1970-71) on two phases; the populations and breeding habitats of biting flies (Tabanidae), and the effect of ditching Juncus marsh on the production of mosquitoes. (Sinha-OEIS)

USE OF SYSTEMS APPROACHES IN PLANNING ISRAEL'S WATER RESOURCES MANAGEMENT,
Tahal Consulting Engineers Ltd. (Tel Aviv, Israel).
M. Gablinger, J. Schwarz, and Y. Vardi.
In: Papers, International Symposium on Water Resources Planning, Mexico City, Mexico Volume III, December 1972, 38 p, 6 tab, 2 fig.

Descriptors: *Water resources, *Regional analysis, *Model studies, Management, Water transfer, Water requirements, Regional development, Water allocation (Policy), Water resources development, Aquifers, Economic impact, Demand, Water demand, Computer models, Statistical models.
Identifiers: *Israel.

The historical, legal, and physical background to Israel's water problems is presented. The principal water resource supply characteristics are identified as large supplies of water in the country's main aquifers, and relatively high seasonal and variable rainfall. Demand, on the other hand, is characterized by a high agricultural use which cannot be significantly reduced in the foreseeable future, in spite of the steadily growing domestic and industrial requirements. A resource management policy is therefore desired to postpone recourse to costly large-scale sea water desalination, indicate ways of using part of the water accumulated in the aquifers while minimizing the danger of irreversible degradation of aquifers, and minimize curtailment in agricultural allocations. At present a series of interacting resources management models is being developed to devise appropriate operational and development patterns. Some of these models, using linear programming and statistical techniques, are outlined. A hierarchy of such models is established in which outputs of more general models serve as inputs for more detailed ones. Sensitivity analyses serve as indicators for information aquisition policies. (Muller-Arizona)

A BAYESIAN DECISION FRAMEWORK FOR SYNTHETIC HYDROLOGY,
IBM Watson Research Center, Yorktown Heights, N.Y.
J. R. Wallis, and P. E. O'Connell.
Available from the National Technical Information Service as PB-226 289 $3.00 in paper copy, $1.45 in microfiche. Completion Report, July 1973. 44 p, 29 ref. OWRR C-4094 (no 9019) (1).

Descriptors: Simulation analysis, Stochastic Processes, Optimization, *Risks, Statistical methods, Synthetic hydrology, *Longterm planning, Decision making.
Identifiers: Operational hydrology, *Monte Carlo methods, *Bayes Theorem, *Decision Theory.

Given that the large uncertainity in the amount of persistence that should be incorporated into synthetic hydrology it is believed that a Bayes risk decision theoretic approach would be the optimal strategy for water resource system designers. A methodology and example of use for this concept are given.
W74-02438

DEVELOPMENT OF MODELS FOR ANALYZING WATER RESOURCES DEVELOPMENT AND USE WITHIN A REGIONAL FRAMEWORK,
Iowa State Univ., Ames.
J. F. Timmons, and J. R. Prescott.
Available from the National Technical Information Service as PB-226 296, $5.25 in paper copy, $1.45 in microfiche. Completion report, ISWRRI-55, Iowa State Water Resources Research Institute, Iowa State University, Ames, Iowa, June 1973. 209 p, 3 fig, 5 tab, 115 ref. OWRR B-015-IA (6).

Descriptors: *Mathematical models, *Water resources development, *Regional analysis, *Economic impact, *Simulation analysis, *Linear programming, Optimization, Planning, Evaluation, Costs, Pricing, Research, Abstracts, Bibliographies, Systems analysis, *Water utilization.
Identifiers: Contiguous water basins.

Reported are the research accomplishments of a project with the following objectives: (1) construction of mathematical models emphasizing (a) integration of the water sector within regional models and (b) the combination of regional models in simulating the impacts of economic development on water uses; (2) incorporation of spatial and temporal dimensions within the above-mentioned models, and the evaluation of effects and costs of alternative institutional and pricing policies to seek a more equitable incidence of water uses; and (3) application of models emphasizing water used within and among contiguous water basins with particular reference to spatial aspects of regional water planning. The journal articles, book chapters, proceedings papers, and dissertations belonging to this research effort are listed. The completed articles, chapters and papers (numbering 6), and detailed summaries of the dissertations (numbering 5) are provided in this volume's appendix; preceding this is a brief section summarizing the models directly pertinent to the aforementioned objectives and the papers dealing with problems of regional modeling influencing the work conducted under the research grant. The modeling techniques considered are primarily simulation and linear programming optimization. (Bell-Cornell)

6B. Evaluation Process

A SUMMARY ANALYSIS OF NINETEEN TESTS OF PROPOSED EVALUATION PROCEDURES

ON SELECTED WATER AND LAND RESOURCE PROJECTS.
Water Resources Council, Washington, D.C.

Report to the Water Resources Council by the Special Task Force, July 1970. 201 p, 13 tab.

Descriptors: *Testing, *Methodology, Water resources development, *Multiple-purpose projects, Analytical techniques, *Evaluation, Research and development, Measurement, Projects, Testing procedures, *Standards, Performance, Variability, Planning, Economic efficiency, Economic justification, *Estimated benefits, *Estimated costs.

A series of tests was instituted by the Water Resources Council in 1969 on several types of water resources projects to determine whether in evaluating the measurement and effects in terms of benefits and costs, and in the formulation of alternative plans, different teams can accomplish appropriate results and achieve reasonably uniform comparability in application. The test results substantiated that the 1969 report was concerned primarily with concepts and included only a few standards and procedures to implement them. Much of that testing effort was directed toward the development of standards and procedures to implement the concepts. The tests indicate that the multiobjective approach to planning is practical. Meaningful results can be accomplished and reasonably uniform comparability in application can be achieved by establishing carefully structured principles, standards, and procedures. The report contains the test procedures used, an analysis of the test results, and an analysis of the methodology and procedure used in the tests. (Mockler-Florida)

W74-02201

USER RELATED STUDY OF THREE MICHIGAN RIVERS,
Michigan State Univ., East Lansing. Dept. of Park and Recreation Resources.
L. W. Moncrief.
Available from NTIS as PB-226 067 $3.75 in paper copy, $1.45 in microfiche. OWRR C-3381 (No 3723) (10). Supplement A of Project Completion Report, July 1973. 78 p.

Descriptors: *Recreation, Recreation demand, *Attitudes, *Michigan, Social aspects, *Water utilization.
Identifiers: *User related study.

Recreational use, user characteristics, and user perceptions were measured on three rivers in Michigan: the Red Cedar, the Au Sable and the Jordan Rivers. The data were gathered by means of a mailed questionnaire, using a population sample obtained on-site at the three rivers. The majority of users on all three rivers had not participated in any recreational activity at 'their' river more than one to four times during the calendar year preceding the time they answered the questionnaire. This study investigates the recreational behavior of the users of three distinct types of recreational rivers. This research should give some idea of the effect of location, latent and ongoing recreation activity opportunities, use conditions and general environmental conditions on behavior and perceptions. Reasons for using a river are complex and not well understood. It would appear that the nearness of the user to a stream may serve as a deterrent to its use for recreation. The questions on both questionnaires, user and non-user, are grouped in an effort to determine certain overall perceptions and attitudes of the respondents. In addition, there are questions to determine uses of the rivers, user perceptions of management and the socio-economic background of the respondents. (See also W74-02201)
W74-02202

ECONOMIC EVALUATION OF THE SPORT FISHERY OF THE AU SABLE RIVER, MICHIGAN,
Michigan State Univ., East Lansing. Dept. of Park and Recreation Resources.
J. W. Pearce, and L. W. Moncrief.
Available from NTIS as PB-226 111 $3.75 in paper copy, $1.45 in microfiche. OWRR C-3381 (43723) (11). Supplement B of a Project Completion Report, July 1973. 65 p.

Descriptors: Economics demand, Natural resources, Management, *Sport fishing, *Michigan, Economic impact, *Cost analysis, Recreation, Input-output analysis, Water utilization, Decision making.
Identifiers: *Au Sable River (Mich), Clawson's method, *Sport fishing.

The Au Sable River sportfishing resource was subjected to a three-phase economic demand analysis utilizing existing statewide fishery survey data collected during 1970 and 1971. Confidence in the applicable data extracted for this analysis is limited; hence, the results drawn from it should be viewed with caution. The best estimate of the economic value to the State of Michigan as a result of resident (state residents) sportfishing on the Au Sable was $536,640 in 1970. Since economic information was not requested of fishermen surveyed in 1971, expenditure data from the 1970 analysis were extrapolated to the angling pressure (angler days) reported during 1971. This gave an estimated overall economic value for the resource of $838,290 in 1971. Natural resources management decisions are becoming increasingly subject to a more explicit definition of costs and benefits. The competition for the use of scarce natural resources, in conjunction with the advent of cost-benefit and cost-effective analyses, places an urgent requirement upon management to more clearly specify program outputs in terms of their (dollar) value to people. The practical application of economic demand analysis in a non-market setting commends itself to finding a solution to many natural resources management problems. (See also W74-02201)
W74-02203

THE DEMAND FOR AND VALUE OF THE SPORT FISHERY ON THE AU SABLE, JORDAN, AND RED CEDAR RIVERS,
Michigan State Univ., East Lansing. Dept. of Park and Recreation Resources.
J. W. Pearce, and L. W. Moncrief.
Available from NTIS as PB-226 114 $3.00 in paper copy, $1.45 in microfiche. OWRR C-3381 (No 3723) (12). Supplement C of Project Completion Report, July 1973. 26 p.

Descriptors: Economics, Sport fishing, Economic impact, *Demand, *Recreation demand, *Evaluation, *Michigan.
Identifiers: Clawson's method, Angler day value, *Sport fishery.

Demand curves for sport fishing on the Au Sable, and Jordan Rivers of Michigan are presented. Data were insufficient to estimate a curve for the Red Cedar. The best estimate of the demand curve for the entire recreation experience using the Au Sable River for sport fishing is $y \pm 361.0012 - 318.8405 \log x$; for the Jordan, $\log y \pm 5.2312 - 4.2571 \log x$. Demand curves for the use of the sport fishery are derived from these curves. The value of the sport fishery is defined as the area under the demand curve for the resource alone which represents the aggregate willingness to pay for use of the resource for sport fishing. The value of the sport fishing on the Au Sable is estimated at $536,000 in 1970 and $846,000 in 1971. The Jordan sport fishery is valued at $17,000 in 1970 and $53,000 in 1971. Demand curves were estimated using the technique suggested by Marion Clawson. The data used were collected in statewide surveys of licensed anglers conducted by the Michigan Department of Natural Resources in 1970 and 1971. (See also W74-02201)
W74-02204

THE EX POST MEASUREMENT OF BENEFITS AND COSTS IN SMALL WATERSHED PROJECTS,
Georgia Univ., Athens. Inst. of Natural Resources.
P. A. Maxwell.
Available from the National Technical Information Service as PB-226 108, $9.50 in paper copy, $1.45 in microfiche. Doctoral Dissertation, May 1973. 136 p, 14 fig, 12 tab, 55 ref, 2 append. OWRR B-059-GA (1). 14-31-0001-3570.

Descriptors: *Evaluation, *Project feasibility, Project planning, River basin development, Water control, Alternative costs, *Benefits, Costs, Recreation, Flood control, Water supply, Social aspects, *Economic feasibility, *Small watersheds, *Cost-benefits analysis.

Methods available to measure the performance of public investment are developed and tested with specific attention to water resources projects for flood control, municipal and industrial water supply, and recreation. The use of 'with-without' analysis in all measurements is recommended, and a distinction is made between direct measurement techniques and indirect measurement techniques. The direct measurements attempt to measure variables showing the net benefits from each project purpose while the indirect techniques measure the growth of surrogate variables which reflect the impact of an entire project. The research uses these methods to measure the ex post performance of two PL 566 small watershed projects in Georgia, Rooty Creek and the Little Tallapoosa River. By observing the growth of income in analogue undeveloped watersheds the conclusion is reached that neither project should have been built. Sources of the discrepancies between ex ante and ex post estimates of costs and benefits from these projects are discussed, and suggestions are made on ways to improve future agency benefit-cost analyses.

TOMBIGBEE RIVER VALLEY WATER MANAGEMENT DISTRICT, TENTH ANNUAL REPORT.
Tombigbee River Valley Water Management District, Tupelo, Miss.

April 1973. 56 p, 10 fig.

Descriptors: *Planning, *Administration, *Water resources development, *Projects, Project purposes, *Mississippi, Conservation, Regional development, Natural resources.
Identifiers: *Tombigbee River (Mississippi).

The Tombigbee River Valley Water Management District was created by the Mississippi legislature in 1962 to provide for the development of various aspects of the Tombigbee River Basin. There are 12 member counties in the District and 3 counties are eligible to become members of the District. The District is funded by local ad valorem taxes. The main objective of the District is to cooperate with and assist every local state, and federal organization that has some responsibility for the conservation and development of the natural resources of the area. Other specific objectives include: (1) assist in the implementation of the Corps of Engineers' Tennessee-Tombigbee Waterway Project, (2) sponsor the implementation of the Corps' flood control project on the Tombigbee River and tributaries, (3) assist in the Corps' study of the Tombigbee River Basin, (4) sponsor the federal water resources planning act in the District, (5) provide public parks and recreation facilities within the District, and (6) cooperate with the State Air and Water Pollution Commission in providing the area with clean and plentiful water. The activities of the previous year are outlined and described briefly. (Poertner)

THE BALANCE OF SURFACE WATER RESOURCES IN THE LOWER MESOPOTAMIAN VALLEY,
Research Inst. for Water Resources Development, Budapest (Hungary).
G. Kienitz.
In: Papers, International Symposium on Water Resources Planning, Mexico City, Mexico Volume III, December 1972, 29 p, 6 tab, 2 fig, 6 ref.

Descriptors: *Water resources development, *Planning, Water requirements, Water management (Applied), Water demand, Water utilization, Irrigation, River basin development, Water supply development, River flow, Management.
Identifiers: *Iraq (Lower Mesopotamian Valley).

Experiences and views concerning the water resources development of the Lower Mesopotamian Valley, based on work with UNESCO in the area in 1971, are presented. Since the inception of active water resources development in the 1930's, Iraq has come far in the fields of data aquisition, planning and supply development. Projected development, however, was not yet evaluated in a comprehensive balance of available water resources with demands. In reviewing work toward estimating steps needed for such a balance, both the present situation and the one to be expected after the realization of prospective reservoirs and irrigation projects are detailed. The cumulative value of water resources as well as of demands were plotted in the way of longitudinal profiles progressing along rivers in a downstream direction. Results show a sharp shortage of water due to extreme specific irrigation water demands, both present and future, and point toward the necessity of detailed investigations of water management practices and balancing in this area. (Muller-Arizona)

EVOLVING WATER POLICY AND MANAGEMENT IN THE UNITED STATES,
Bureau of Reclamation, Washington, D.C.
W. D. Fairchild.
In: Papers, International Symposium on Water Resources Planning, Mexico City, Mexico Volume III, December 1972, 19 p.

Descriptors: *Planning, *Water management (Applied), *Water allocation (Policy), *Regional development, Water resources development, Optimum development, *Multiple purpose, Water supply development, Water quality control, Flow augmentation, Geothermal studies, Colorado River Basin, Reclamation states, National water commission, Water law, Environmental effects.

In recent years the philosophy behind water resources planning in the U.S. has been altered by changing public goals and values from a single-purpose, single-project approach to one of multiple-purpose and comprehensive regional planning. The Bureau of Reclamation has developed procedures to apply the new 'Principles and Standards for Planning Water and Land Resources' that have been proposed by the Water Resources Council, and which convey this new philosophy. These procedures are in use in the Bureau's 11-state Western U. S. Water Plan to develop comprehensive reconnaissance plans to meet the needs of the region involved and will study the feasibility of augmenting the water supply of the Colorado River by weather modification, desalting, geothermal development, and water reuse. Changing priorities of water use give greater emphasis to the purpose of municipal and industrial water, recreation, and enhancement of fish and wildlife resources. The importance of water quality is taking its place along with water quantity. Efficiency of planned systems is considered now, as well as the environmental impact of such systems. (Muller-Arizona)
W74-02358

EVALUATION OF THE REGIONAL MULTIPURPOSE ECONOMIC BENEFITS RESULTING FROM A WATER AND RELATED LAND RESOURCE DEVELOPMENT,
Idaho Univ., Moscow. Water Resources Research Inst.
K. H. Lindeborg.
Available from the National Technical Information Service as PB-226 261 $3.00 in paper copy, $1.45 in microfiche. Technical Completion Research Report, Sept. 1973, 38 p. 3 fig, 6 tab, 2 ref. OWRR C-2195 (no 3384) (1).

Descriptors: *Water resources development, *Irrigation programs, *Land development, *Multipurpose projects, *Economic feasibility, Cost-benefit analysis, Recreation, *Idaho, Model studies, Evaluation.
Identifiers: Mountain Home (Ida.).

A study area in southwest Idaho, Mountain Home, was selected for a multi-disciplinary project to determine the optimum multi-purpose development of water resources in the area. This report, one of several, focuses on two functions, irrigation and recreation, of the overall Bureau of Reclamation plan designed to meet the present and foreseeable future water needs of the area. An effort was made to conceptualize the development of the area by developing a model to measure the impact of water projects thereon, including economic benefits, though this objective was not completely realized. Sufficient data were gathered, however, to show a trend toward large development of private farms from desert land, and sales of state land for agricultural purposes. A 15 percent increase in irrigated acreage over 1909 figures is shown, with irrigation water for these new farms coming from groundwater sources and some high-lift pumping from the Snake River. Some sprinkler irrigation units are now in use. Attention is given to costs associated with increased irrigation, notably power needs. Brief mention is made of recreation possibilities, particularly pheasant hunting. (Paylore-Arizona)

STATE WATER PLAN,
S. E. Reynolds.
In: State Water Plan, Proceedings of 18th Annual New Mexico Water Conference, April 5-6, 1973, Las Cruces: New Mexico State University Water Resources Research Institute Report No 026, p 10-18, July 1973.

Descriptors: *Water resources development, *Water Resources Planning Act, *New Mexico, Federal government, State governments, Reviews, Projects, Water rights, Legal aspects, Water utilization, Irrigation, Water supply, Surface waters, Groundwater, Water importing.
Identifiers: *State water plan (N Mex).

One of the major functions of the Interstate Stream Commission is to review and comment on plans for federal water projects in New Mexico and on interstate streams in other states to make sure that New Mexico's interests are protected. This work includes cooperation in and coordination of the work of federal agencies in planning projects in New Mexico. The Commission has participated in the formulation of project plans, operating criteria, and authorizing legislation for many federal projects, including the Navajo Dam and Reservoir Project and related Navajo Indian Irrigation Project on the San Juan River, the San Juan-Chama Diversion Project, the Animas-La Plata Project on the Animas River in Colorado and New Mexico, and the Hooker Unit of the Central Arizona Project, all Bureau of Reclamation Projects and the Corps of Engineers Cochiti and Galisteo Reservoir Projects. There is underway a study of the practicability of bringing surplus water from the Mississippi River system to West Texas and Eastern New Mexico to sustain the irrigation economy based on groundwater mining. Many other projects and plans are discussed. (See also W74-02456) (Woodard-USGS)

POPULATION PROJECTSIONS FOR THE NEW MEXICO STATE WATER PLAN,
New Mexico Univ., Albuquerque. Bureau of Business Research.
L. B. Zink.
In: State Water Plan, Proceedings of 18th Annual New Mexico Water Conference, April 5-6, 1973, Las Cruces: New Mexico State University Water Resources Research Institute Report No 026, p 19-29, July 1973. 1 tab, 1 ref.

Descriptors: *Water resources development, *Water demand, *Projections, *Human population, *New Mexico, Estimating, Forecasting, Water utilization, Reviews, Evaluation.
Identifiers: *State water plan (N Mex).

The projections of population, employment, and income formulated as guides for water-use planning in New Mexico are the work of two separate organizations and numerous researchers. The basic philosophy underlying these projections is that the size of New Mexico's population in the forseeable future will be determined by the size of the State's employment, by the nature of its resources, and by the character of the utilization of those resources. Employment is the major determinant of population size. The assumption is that all counties in New Mexico will have greater populations in 1980 than in 1970. That is, all New Mexico counties are assumed to have already reached their lowest population level. The highest estimated population for the State in the year 2020 is 4,621,400. A STUDY OF WATER USED ON URBAN LANDSCAPES,
New Mexico State Univ., University Park. Dept. of Horticulture.
F. Chavez, III, and D. J. Cotter.
In: State Water Plan, Proceedings of 18th Annual New Mexico Water Conference, April 5-6, 1973, Las Cruces: New Mexico State University Water Resources Research Institute Report No 026, p 30-39, July 1973. 4 fig, 8 ref.

Descriptors: *Water utilization, *Lawns, *Urbanization, *Landscaping, *New Mexico, Sprinkler irrigation, Cities, Surveys, Rates of application, Water loss, Soil types.
Identifiers: *Urban landscapes, Lawn watering.

A study conducted to determine the water used by urban home owners in Las Cruces, New Mexico, to maintain their landscapes showed that from 40% to 65% of private metered water was used for maintaining plants in the landscape. The water quantity used was in proportion to living mesic plants. Homeowners with 90% to 100% of the space devoted to living plants applied 99% more water per home than landscapes characterized as intermediate, where living plants were maintained on only 50% to 70% of the space. A highly significant correlation coefficient of 0.738 was obtained between landscape water use and landscape size. However, approximately 38% of the average amount of water utilized for landscape irrigation is in excess of estimated optimum amounts. Renewed emphasis on education programs directed toward an attempt to encourage wise water usage is urgently needed. (See also W74-02456) (Woodard-USGS)

'CLEAN ENERGY VIA COAL GASIFICATION',
Fluor Corp. Ltd., Los Angeles, Calif.
A. J. Paquette, and M. R. Beychock.
In: State Water Plan, Proceedings of 18th Annual New Mexico Water Conference, April 5-6, 1973, Las Cruces: New Mexico State University Water Resources Research Report No 026, p 62-77, July 1973. 4 fig, 3 tab.

Descriptors: *Coals, *Gases, *Energy conversion, *Natural gas, *New Mexico, Methodology, Pilot plants, Water requirements.
Identifiers: *Coal gasification, Lurgi coal gasification process.

The commercial gasification of coal has been practiced for at least 50 years. A natural gas shortage plus the emphasis on removal of sulfur from fuels, has accelerated the search for new sources of Substitute Natural Gas and new supplies of Liquefied Natural Gas. The Lurgi gasification process will be used in the recently announced New Mexico coal gasification project. The Lurgi pressure coal gasification process, which was developed in 1930, has proven, large-scale commercial experience. Since 1936, the Lurgi process has been used commercially in many parts of the world, including Germany, Scotland, South Africa, and Korea. (See also W74-02456) (Woodard-USGS)

REPORT BY THE NATIONAL WATER COMMISSION--A REVIEW,
Texas Water Development Board, Austin.
H. P. Burleigh.
In: State Water Plan, Proceedings of 18th Annual New Mexico Water Conference, April 5-6, 1973, Las Cruces: New Mexico State University Water Resources Research Institute Report No 026, p 78-83, July 1973.

Descriptors: *Water resources development, *National Water Commission, *Reviews, Water demand, Water utilization, Environmental control, Ecology, Water quality control, Water pollution control, Planning, Projections, Economics, Social aspects.

The duties of the National Water Commission as set forth in Public Law 90-515, 90th Congress, S. 20, September 26, 1968, covered a range of water subjects from a review of present and anticipated national water resources problems to a consideration of economic and social consequences of water resource development and allocation. Its task was rendered difficult because the Nation is undergoing a period of rapid change in social and environmental preferences, and these preferences have a direct bearing upon the Commission's view of its mission to determine 'what policies the Nation should adopt to ensure that its finite water resources are used in ways which yield the highest measure of welfare to society, now and in the future.' In carrying forward its work, and in the conclusions incorporated in the Review Draft of the Commission's Proposed Report, the Commission has made valuable contributions to the solution of some of the perplexing resource management problems of the Nation, and has addressed some long-needed institutional changes to reflect its view of the proper governmental posture in the light of present conditions. Particularly significant findings by the Commission are presented in this review. (See also W74-02456) (Woodard-USGS)

FLOOD CONTROL FUNDS -- 1970 REPORT TO THE LEGISLATURE.
California State Dept. of Water Resources, Sacramento.

Bulletin No 158-70, January 1971. 7 p, 3 tab.

Descriptors: *Flood control, *Projects, *Expenditures, California, *Costs, Documentation, Flood protection, Right-of-way, Relocation, Engineering structures.
Identifiers: *California Water Code, Flood control project funds.

Expenditure of state flood-control funds are reported for California from January 1 through December 31, 1970, by the Department of Water Resources and The Reclamation Board. The California Water Code requires that expenditure of such funds be reported by the 15th day of each regular session of the State Legislature. Expenditures made during the year for projects under the juridiction of the Department and the Board are presented separately. During 1970 the Department issued reallocation orders in a net amount of $5,803,907.94. Expenditures by the Department since its program's inception in 1946 total $122,380,000. The Reclamation Board expended $3,199,557 in 1970. Expenditures by the Board since its program began in 1917 total $99,295,385. (Woodard-USGS)

THE PROBLEMS AND ISSUES OF IMPLEMENTING THE FEDERAL WATER PROJECT RECREATION ACT IN THE PACIFIC NORTHWEST,
Oregon State Univ., Corvallis. Dept. of Geography.
K. W. Muckleston.
Available from the National Technical Information Service as PB-226 295, $4.50 in paper copy, $1.45 in microfiche. Oregon State University Water Resources Research Institute Completion Report WRRI-20, October 1973. 136 p, 10 fig, 16 tab, 56 ref, 2 append. OWRR B-025-ORE (1) 14-31-0001-3632.

Descriptors: *Cost sharing, *Federal-state cooperation, *Recreation, *Fish management, Political aspects, Reservoir operation, Water resource development.
Identifiers: Pacific Northwest, Washington, Oregon.

The research assesses the implementation of the Federal Water Project Recreation Act in the Pacific Northwest in particular and in the U.S. in general. By passage of the Act Congress sought to (1) place the Bureau of Reclamation and Corps of Engineers on equal ground re the provision of recreation; (2) ensure that recreation and fish and wildlife became coequals with traditional project purposes; and (3) devolve upon nonfederal entities more financial and planning responsibilities for the enhancement of recreation and fish and wildlife. Implementation of the Act is halting and uneven at best. Implementation is more difficult in the Pacific Northwest than in the rest of the U.S. Although the protracted project gestation period and relative recency of the Act preclude firm conclusions, trends are apparent: It was unrealistic for Congress to expect the Act to accomplish the three goals given the water development system in which PL 89-72 operates. In general federal agencies have been slow to relinquish planning prerogatives to the nonfederal entities, who in turn have been hesitant to cost-share what was once free. Moreover, many nonfederal entities do not have the planning expertise to make meaningful planning inputs. Recreation and fish and wildlife have not attained coequality among project purposes; and the Corps continues to retain the advantage vis-a-vis the Bureau of Reclamation in the provision of recreation. Some of the variables that appear to influence the nonfederal decision to cost-share are: the relative expense of participation, spatial priorities, philosophy of cost-sharing, importance of withholding PL 89-72 functions from the project b/c ratio, extraordinary sources of funds, receptivity to post-industrial values, constitutional limitations on indebtedness, attitude towards charging user fees.

NEW CONCEPTS IN THE LAW OF THE SEA,
John Hopkins Univ., Washington, D.C. School of Advanced International Studies.
J. L. Hargrove.
Ocean Development and International Law Journal, Vol 1, No 1, p 5-12, Spring 1973.

Descriptors: *International law, *Political aspects, *Law of the sea, *Exploitation, *Administration, Regulation, Legal aspects, Governmental interrelations, Navigation, International waters, Jurisdiction, Straits, Mining, Resources development, Oceans, Pollution abatement, Fish conservation, Military aspects.

Two competing approaches to the law of the sea are discussed: the view that the coastal state should control activities in any large adjacent ocean areas, at least for various purposes which it deems important; and the view that most of the ocean should be left open to the free use of all nations. Both approaches have a good deal in common; these common characteristics are discussed. In the upcoming international conference these two competing approaches will be exhibited in competing claims for navigation rights, mineral resources, fishing, environmental protection and strategic uses. A possible solution is the concept of the whole ocean as a common resource of humankind, according to which no individual state has a right to benefit from the ocean except pursuant to arrangements sanctioned by the community. A suggested form of implementation would include: (1) a narrow territorial sea and various navigation guarantees, (2) a wide coastal band coupling coastal state managerial functions with permanent international prerogatives and (3) purely international management of the deep seabed. (Napolitano-Florida)

SCIENTIFIC ASPECTS OF MARITIME SOVEREIGNTY CLAIMS,
Scripps Institution of Oceanography, San Diego, Calif.
W. S. Wooster.
Ocean Development and International Law Journal, Vol 1, No 1, p 13-20. Spring 1973. 15 ref.

Descriptors: *International law, *Peru, *Continental shelf, *Boundary disputes, *Jurisdiction, Regulation, Currents (Water), Fish populations, Ecosystems, Sediment transport, Sea Water, Ocean currents, Temperature.

The scientific arguments used to justify Peruvian claims for extensions of maritime sovereignty are compared with available oceanographic information on the eastern South Pacific. Areas of discussion and dispute include: geographical characteristics of the Peruvian land area and submarine topography, territorial erosion, ocean currents and temperatures, and fishing resources. Comparison shows that oceanographic criteria appear to provide little support for the Peruvian position which is basically political rather than scientific in nature. (Napolitano-Florida)

INDICES OF NATIONAL INTEREST IN THE OCEANS,
Rhode Island Univ., Kingston. Law of the Sea Inst.
L. M. Alexander.
Ocean Development and International Law Journal, Vol 1, No 1, p 21-49, Spring 1973. 28 ref, 7 tab.

Descriptors: *International law, *Continental shelf, *Continental margins, *Jurisdiction, *Governments, International waters, Regime, Regulation, Institutional restraints, Boundary disputes, Leagal aspects, Mining, Beds under water, Fish, Fish conservation, Commercial fishing, Straits, Bays, Islands.

Each of the independent states of the world has a particular set of interests in the ocean. By analyzing the nature of national maritime interests it is possible both to develop a generalized model which can be applied to any state, and to devide states into groupings depending upon their physical characteristics with respect to the marine environment. The four basic components of national maritime interests are: accessibility, investment, dependence, and control. With reference to accessbility, land-locked, shelf-locked and states with large outer continental margins are discussed. In the area of investment, capital investment in distant-water fishing fleets, off-shore oil wells, merchant ships, marine recreational facilities and pollution control units are discussed. With reference to dependence, areas covered include proportion of labor force engaged in marine activity; the need for sea transportation of imports and exports; and claims of special legal treatment. Finally, in the area of control-purported area of jurisdiction and forms of jurisdiction, territorial sea, contiguous zones, exclusive fisheries, pollution prevention, fish conservation, and claims to seabed and subsoil are discussed. (Napolitano-Florida)

OCEAN SCIENCE AND MUTUAL ASSISTANCE: AN UNEASY ALLIANCE,
Columbia Univ., New York. Graduate School of Business.
G. Pontecorvo.
Ocean Development and International Law Journal, Vol 1, No 1, p 51-64, Spring 1973. 8 ref.

Descriptors: *International law, *Jurisdiction, *Administration, *Political aspects, *Legal aspects, Regulation, Institutional restraints, Exploitation, Law of the sea, Governments, Governmental interrelations, Government finance, Government supports, Economic feasibility, Economic justification, Cost-benefit analysis, Input-output analysis, Research and development.

Current negotiations over the law of the sea are concerned with, in part, the question of scientific research in the oceans. Historically, the narrow definition of territorial sea favored the major maritime powers and enabled ocean scientists to work relatively freely. Since World War II two major developments, the seaward extension of national jurisdiction and the attitude of certain nations toward the role of science in society, have begun to impinge on ocean research. The use of mutual assistance programs aimed at improving the capability of developing nations in ocean science is emphasized as a method of improving international relations and thereby creating a climate for relatively unimpeded ocean research. The necessary conditions for the operation of these programs, the costs associated with them and an approach for their implementation are discussed. (Napolitano-Florida)

DEVELOPMENT OF THE FREEDOM OF SCIENTIFIC RESEARCH ISSUE OF THE THIRD LAW OF THE SEA CONFERENCE,
Rhode Island Univ., Kingston.
J. A. Knauss.
Ocean Development and International Law Journal, Vol 1, No 1, p 93-120, Spring 1973. 1 tab, 47 ref, 2 append.

Descriptors: *International law, *Continental shelf, *Research and development, *Political aspects, Legal aspects, Boundary disputes, Jurisdiction, International waters, Oceanography, Pollution identification, Administration, Exploitation, Fish.
Identifiers: Coastal waters.

The importance of scientific research and the benefits that will flow to all mankind are explained and an attempt is made to differentiate between such research and those activities directly related to resources exploitation. It is believed that as a consequence of decisions relating to resource jurisdiction and other issues at the forthcoming Law of the Sea Conference, conduct of bona fide scientific research in the ocean will be made more difficult. Many nations view such research as a threat to their economic and political security. The concerns of the coastal nations are examined and suggestions made as to how some of these concerns may be alleviated. Certain sources of ocean pollution and their effect are briefly discussed as are opinions and proposals of the scientific community. Specific treaty language is proposed. (Napolitano-Florida)

LEGAL DEVELOPMENTS IN CANADIAN WATER MANAGEMENT,
Department of the Environment, Ottawa (Ontario).
C. G. Morley.
Western Ontario Law Review, Vol 11, p 139-158, 1973. 134 ref.

Descriptors: *Federal-state water rights conflicts, *Canada, *Water quality, *Legislation, *Legal review, Water resources development, *Natural resources, Water quality standards, Law enforcement, Waste water pollution, Sources, Permits, Water pollution, Pollution, Governments.

Three recently enacted statutes and amendments to a fourth exemplify new Canadian federal initiatives in water law. Underlying these laws is the jurisdictional issue in that the various provinces retain ownership and the right to control the use of natural resources within their respective boundaries. The outer limits of federal jurisdiction are not defined. The first of the four statutes which are analyzed is the Canada Water Act which was enacted to provide a legislative framework within which the federal government could respond to the need for controls over water resource use and management. It provides for the creation of water quality management agencies for federal water and for non-federal waters if the water quality management of those waters has become a matter of urgent national concern. The Northern Inland Waters Act's objectives are to conserve, develop and utilize Canada's northern waters for all Canadians and particularly for the residents of the Yukon Territory and the Northwest Territory. The Arctic Waters Pollution Prevention Act and amendments to the Fisheries Act are also analyzed. (Gragg-Florida)

EASEMENTS: JUDICIAL AND LEGISLATIVE PROTECTION OF THE PUBLIC'S RIGHTS IN FLORIDA'S BEACHES,
W. R. Bowdoin.
University of Florida Law Review, Vol 25, p 586-596, 1973. 69 ref, append.

Descriptors: *Florida, *Coasts, *Beaches, *Legal aspects, Common law, Legislation, Easements, Public access, Legal aspects, Judicial decisions.

An ever increasing public use of coastal beach property has resulted in private property owners restricting their beaches for their exclusive use. This exclusion problem in coastal states is leading to a reevaluation of the private owner's property rights. Court decisions in these states indicate that beach property is regarded as having a unique quality that requires different treatment from inland property. Courts of coastal states are protecting the interests and rights of the public through the use of easement theories. These courts have made use of three common law doctrines to establish public easements in private beaches: prescription, implied dedication, and custom. Legislative action is a fourth possibility. This commetary evaluates these four methods of establishing public easements and proposes judicial and legislative solutions to Florida's beach property problem. The custom doctrine is the best judicial remedy to protect the public's interest in Florida's beaches. (Sears-Florida)

PROPER TIME LIMITATIONS ON OUTER CONTINENTAL SHELF LEASES UNDER THE NATIONAL ENVIRONMENTAL POLICY ACT,
W. M. Babovich.
Houston Law Review, Vol 10, p 158-168, October 1972. 64 ref.

Descriptors: *Alternative planning, *Alternative water use, *Environmental effects, *Legislation, Permits, Planning, Gulf of Mexico, Leases, Administrative agencies, Ecology, Judicial decisions, Legal aspects, Oil fields, Exploration.
Identifiers: National Environmental Policy Act, Injunctive relief, Energy requirements.

Natural Resources Defense Council v. Morton is noteworthy among environmental litigation as the first decision directly analyzing the National Environmental Policy Act (NEPA) requirement that alternatives to proposed governmental actions be studied to determine their effect on the environment. Plaintiffs, environmental groups, successfully brought suit to enjoin the acceptance of bids for oil and gas leases in the Gulf of Mexico. Plaintiffs contended that the federal agencies involved had insufficiently reviewed potential alternatives to the proposed leases. A preliminary injunction was affirmed, on the basis that the government had not sufficiently analyzed the available alternatives for satisfying the energy requirements of the Nation. Cases prior to the enactment of NEPA are surveyed, and the conclusion is that only certain federal agencies were required to consider the environmental effects of their actions. Cases subsequent to enactment of NEPA are surveyed and show that now every federal agency has a statutory mandate to investigate the environmental effects of its actions. The mandate of the NEPA is that alternatives to proposed government action be examined to the fullest extent possible. Unless courts require a study of alternatives available for the present time and for decades to come, the Nation may again face ecological problems on a crisis-by-crisis basis. (Gragg-Florida)

PUBLIC ACCESS TO BEACHES: COMMON LAW DOCTRINES AND CONSTITUTIONAL CHALLENGES.

New York University Law Review, Vol 48, p 369-394, May 1973. 173 ref.

Descriptors: *Coasts, *Beaches, *Legal aspects, *Public access, Constitutional law, Public rights, Shores, Judicial decisions, Recreation, Seashores, Surf, Common law.
Identifiers: Public trust doctrine.

The need for special policies protecting public rights to the use of beaches has been recognized by the state courts and legislatures, as well as by the federal government. The diminishing access to beaches has led many citizens to institute legal action of some type. This note examines and evaluates the legal approaches open to the courts in their adjudication of such cases. It also deals with the question of whether efforts to expand public legal rights may have the adverse practical effect of limiting public access to beaches. The two major legal weapons available if the beach is privately owned are the doctrine of implied dedication and custom. If the beach is municipally owned, the doctrine of express dedication may be useful. The successful application of these theories depends on the facts of the given case. The litigant may also use the less fact-dependent theories of the jus publicum and public trust. Alternatively, he can use the constitutional argument that restrictions on municipally owned beaches deny nonresidents equal protection of the law. (Sears-Florida)

IN RE CHINESE MARITIME TRUST, LTD., (WRECK OBSTRUCTING NAVIGABLE WATERS OF THE PANAMA CANAL).

361 F. Supp. 1175-1179 (S.D.N.Y. 1972). 5 p.

Descriptors: *Panama Canal, *Navigable water, *Judicial decisions, *Navigation, *Rivers and Harbors Act, Ships, Legislation, Legal aspects, Canal zone, Canals.
Identifiers: Admiralty, Navigation obstructions.

A wreck obstructed the navigable waters of the Panama Canal. The Panama Canal Company, a government-owned corporation, sought a declaration that action for the cost of removal of a wreck obstructing navigable waters of the Panama Canal Zone was not subject to a restraining order entered in a limitation of liability proceeding. By federal statute, a ship owner can limit his liability for losses caused by the ship if those losses were incurred without the privity or knowledge of such owner. The United States District Court found as a matter of law that liability in removing wrecks was within the privity and knowledge of the owner and therefore not subject to limitation. The court made no determination on the absolute liability of the shipowners as to be held ultimately liable for the removal costs. Thus, there must be a showing that the ship was negligently sunk. The court here only precluded the shipowner from limiting his liability. (Gragg-Florida)

YOFFE V. SPECIAL BOARD, CHAPTER 387, (STATE DENIAL OF LICENSE TO EXPLOIT NATURAL RESOURCES OF A LAKE BED).

304 A.2d 876-879 (N.H. 1973). 4 p.

Descriptors: *Lake beds, *Dredging, *Permits, *State governments, *Legal review, Judicial decisions, Mining, *New Hampshire, Legislation, Exploitation.

Plaintiff, an individual, was denied a license to exploit natural resources located on a lake bed belonging to the State of New Hampshire by a Special Board created by the New Hampshire legislature for the purpose of deciding matters relative to resources of the state, including but not limited to excavating, dredging and filling waters of the state. The issue was whether the plaintiff was entitled to avail himself of certain statutory judicial review provisions. The state supreme court held that the plaintiff was not entitled to judicial review of the Board's decision. The court held that the statutory judicial review provisions relied on by the plaintiff were only applicable to Board decisions involving privately owned wetlands. The purpose of the review mechanism was to assure judicial scrutiny of regulation which can potentially reach a degree of restrictiveness that amounts to a taking of private property for which compensation must be paid. The court found no reason for extending this judicial protection beyond the 'privately owned wetlands situation'. (Gragg-Florida)

SALMON FALLS DIVISION, UPPER SNAKE RIVER PROJECT, IDAHO, PART 11.
Hearing--Subcomm. on Irrigation and Reclamation--Comm. on Interior and Insular Affairs, U.S. House of Representatives, 92d Cong, 2d Sess, May 15, 1972. 166 p.

Descriptors: *Legislation, *Irrigation, *Wildlife management, *Idaho, Water distribution, Drainage facilities, Aquatic environment, Flood control, Economics, Water resources development, Watershed management, Habitat improvement, Water management (Applied).

The Secretary of the Interior is authorized to construct, operate, and maintain the Salmon Falls division of the Upper Snake River Project in Idaho. The principal works of the division would consist of the Milner pumping plant, the Milner-Salmon Falls Canal, relief and pumping stations, water distribution facilities, and wells to provide supplemental water, and drainage facilities. The primary purposes served by the project would be irrigation and fish and wildlife enhancement. The available surface and ground water supplies of the service area have been fully utilized by local interests for irrigation but are inadequate to serve the 49,380 acres presently developed. The proposed facilities of the Salmon Falls division, together with existing facilities, would provide a full supply of water for the irrigation of 64,110 acres of land on the southside of the Snake River in Southern Idaho, including the lands now developed. The construction cost of the division is estimated at $47,252,000. (Mockler-Florida)

RIVER BASIN MONETARY AUTHORIZATIONS--DISASTER RELIEF ACT AMENDMENTS.
Hearing--Subcomm. on Flood Control and Internal Development--Comm. on Public Works, U.S. House of Representatives, 92d Cong, 1st Sess, November 30, 1971. 50 p.
Identifiers: *Legislation, *River basin development, *Economics, *United States, *Federal budget, Legal aspects, Water resources development, Flood control, Comprehensive planning, River basins, Water supply, Watershed management.

A bill would authorize additional appropriations for prosecution of projects in certain comprehensive river basin plans for flood control and navigation; provide for contributions by the federal

government to repair, restore, reconstruct, or replace nonprofit hospitals under the provisions of the 1970 Disaster Relief Act; provide federal financial assistance for the reconstruction or repair of private nonprofit medical care facilities which are damaged or destroyed by a major disaster; and amend the Disaster Relief Act of 1970 to authorize disaster loans with respect to certain losses arising as the result of recent natural disasters. The River Basin Monetary Authorization Act of 1970 provided funds for two calendar years to be used in thirteen river basins and for individual projects in these basins throughout the United States. The monetary authorization for certain of the river basin plans will become exhausted in a short time; therefore, it became necessary for the Congress to act on additional authorizations for funds so there will not be a discontinuance nor interruption of the projects. (Mockler-Florida)

COLEMAN V. FORISTER (SUIT TO ESTABLISH RIGHT OF USE OF LAND FOR INGRESS AND EGRESS TO CREEK WATERFRONT).

497 S.W.2d 530-534 (Texas 1973). 5 p.

Descriptors: *Judicial decisions, *Easements, *Banks, *Boundary dispute, *Public access, *Texas, Legal aspects.
Identifiers: Injunctive relief, Egress, Ingress, Water rights (Non-riparians).

Plaintiffs, landowners, had secured an injunction which ordered the defendants to remove a building which obstructed plaintiffs' right of ingress and egress to a creek. The defendants appealed. The plaintiffs based their claim on a conveyance which was to make waterfront privileges available. The Texas Court of Appeals, after finding that the structure would interfere with the ingress and egress of the plaintiffs, upheld the injunction, finding that the defendants had constructed the structure with full knowledge and appreciation of the risks involved in the pending litigation. (Gragg-Florida)
W74-02517

ENVIRONMENTAL PROTECTION ACT OF 1973, FIRST SESSION ON S.1104.

Hearings--Subcomm. on the Environment--Comm. on Commerce--U.S. Senate, 93d Cong, 1st Sess, April 2 and 5, 1973. 342 p.

Descriptors: *Environmental protection, *Environmental control, *Legislation, *United States, Preservation, Interstate commerce, Legal aspects.
Identifiers: Congressional hearings, Standing (Legal).

The objectives of this bill are to extend the concept of standing to sue government agencies and private parties, to remove restrictions on judicial review of administrative action, and to grant to citizens the right to sue to enforce federal agency regulations. This bill would establish a system of actual notice to potential plaintiffs for the purpose of encouraging them to join in the same litigation, thus reducing the number of suits. It would also provide for a consolidation procedure to permit merging of suits brought in different courts against the same defendant. The stated purpose of this bill is to promote and protect the free flow of interstate commerce without reasonable damage to the environment; to assure that activities which affect interstate commerce will not unreasonably injure environmental rights; to provide a right of action for relief for protection of the environment from unreasonable infringement by activities which affect interstate commerce and to establish the right of all citizens to the protection, preservation, and enhancement of the environment. (Daniels-Florida)
W74-02518

GENOVA V. CITY OF KANSAS CITY (NUISANCE ACTION BROUGHT BY LANDOWNER AGAINST CITY FOR DAMAGE TO PROPERTY ALLEGEDLY CAUSED BY FLOW OF SURFACE WATERS FROM CITY-OWNED CEMETERY).

497 S.W.2d 555-560 (Missouri 1973). 6 p.

Descriptors: *Judicial decisions, *Storm runoff, *Surface runoff, *Urban drainage, *Groundwater, Storm drains, Drain runoff, *Missouri, Rainfall intensity, Drainage water, Act of God.

The defendant, City of Kansas City (City), appealed a monetary judgment recovered by the plaintiff property owner for water damage done to plaintiff's building. The water damage was a result of the City's failure to properly maintain the boundaries of a cemetery owned by it, which allowed surface water collected in the cemetery during heavy rains to flow onto the plaintiff's land. The Missouri Court of Appeals found that the evidence supported the jury's findings that deterioration of a tile drain allowed water to collect and to be released in unnatural or increased volume onto plaintiff's property. The court found this constituted a nuisance. The defendants contended that the damage was caused by an act of God. The court defined an act of God as an event in nature so extraordinary that the history of climatic variations in the locality affords no reasonable warning of their coming. The court found that this issue had been resolved by the jury as not constituting an act of God. (Gragg-Florida)
W74-02519

STATE OF NEW JERSEY, DEPARTMENT OF ENVIRONMENTAL PROTECTION V. JERSEY CENTRAL POWER AND LIGHT COMPANY (ACTION TO ENFORCE PENALTY PROVISION FOR DISCHARGE OF HARMFUL SUBSTANCE INTO TIDAL WATERS).
308 A 2d 671-674 (N.J. 1973). 4 p.

Descriptors: *Judicial decisions, *Penalties (Legal), *Discharge, *Fishkill, *Discharge (Water), Electric generators, Tidal waters, Legal aspects, Law enforcement, *New Jersey, Fish, Cooling, Industrial water, Heat balance, Thermal pollution, Pollution abatement.

The plaintiff, the New Jersey Department of Environmental Protection, brought action against the operator of an electric generator plant for discharge of a harmful substance into tidal waters. The state sought to enforce penalty provisions for such discharge and also to collect damages from a fish kill caused by the discharge. The discharge resulted from the operation of the defendant which pumped water from one river, used it for cooling purposes and discharged it into another creek. The water discharged was warmer due to its cooling function. On the date of the discharge in question the defendant shut down its generator but continued to discharge water which was substantially cooler due to the shutdown. This lowering of the temperature caused a fish kill. The Superior Court of New Jersey found such discharge to fall within the statutory prohibition and fined the defendant. The court also charged the defendant with the value of the fish killed based on the state's obligation to ensure that the rights of the public to a viable marine environment are protected. (Gragg-Florida)
W74-02520

BARTA V. BRINEGAR (CIVIL ACTIONS BROUGHT AGAINST FEDERAL AND STATE OFFICIALS SEEKING TO ENJOIN CONSTRUCTION OF HIGHWAY SEGMENT UNTIL COMPLETION OF ENVIRONMENTAL IMPACT STUDY).
358 F. Supp. 1025-1031 (W.D. Wis. 1973). 6 p.

Descriptors: *Wetlands, *Judicial decisions, *Legislation, *Highway effects, *Environmental effects, Habitats, Highways, Marshes, *Wisconsin, Federal government, Administration, Life cycles, Aesthetics, Conservation, Ecology.
Identifiers: Injunctive relief, National Environmental Policy Act, Environmental impact statement.

The construction of a highway by the state of Wisconsin was sought to be enjoined by plaintiff landowners until a study of the impact on the environment has been completed pursuant to the National Environmental Policy Act (NEPA). The segment of highway in question passes through a marsh. The state contended that an impact statement was unnecessary based on guidelines of the Federal Highway Administration (FHWA). These guidelines provide that an impact statement need not be prepared if the project received design approval before February 1, 1971, and this project had received its approval prior to this date. The United States District Court found that the plaintiffs had standing to bring the action because the disputed construction would injure their aesthetic, conservational and recreational interests. The court then proceeded to override the FHWA transitional guidelines and granted an injunction until a NEPA impact statement could be prepared. (Gragg-Florida)
W74-02521

U.S. V. AMERICAN CYANAMID COMPANY (ACTION FOR DISCHARGE INTO NAVIGABLE WATERWAYS).

480 F.2d 1132-1135 (2d Cir. 1973). 4 p.

Descriptors: *Water pollution, *Chemical wastes, *Industrial wastes, *Water pollution control, *Judicial decisions, Law enforcement, Penalties, Legislation, Pollution abatement, Navigable waters, Streams, Protective coatings, Plastics.
Identifiers: Refuse Act of 1899.

Appellant, American Cyanamid Company, appealed from a conviction of discharging refuse into a tributary of navigable water in violation of the Refuse Act of 1899. The plaintiff operates its Standard Coated Products plant on the bank of a brook one mile from where the brook flows into the Hudson River. As a result of employee negligence a storage tank in the basement of the appellant's plant overflowed, releasing a mixture of titanium dioxide and calcium carbonate into the brook. The sole question of law involved was whether the government must establish beyond a reasonable doubt that the particular refuse discharge actually was washed into navigable water or whether it was only necessary to show that the discharge of refuse was extensive enough so it would be likely to be washed into the navigable water. The court, after reviewing the legislative history of the Refuse Act, followed the precedent of the United States Supreme Court that the Act should be interpreted broadly. The court thus held that it was not necessary to prove that the discharge actually reached navigable water. (Gragg-Florida)
W74-02522

CAMDEN SPECIAL ROAD DISTRICT OF RAY COUNTY V. TAYLOR, (ACTION BY SPECIAL ROAD DISTRICT FOR MANDATORY INJUNCTION COMPELLING LANDOWNERS TO REMOVE LEVY AND TO PERMANENTLY ENJOIN THEM FROM CONSTRUCTING LEVY).

405 S. W.2d 93-100 (Mo. Ct. App. 1973).

Descriptors: *Obstruction to flow, *Groundwater barriers, *Judicial decisions, *Surface drainage, *Flooding, Surface runoff, State jurisdiction, State government, Flood control, Levee, *Missouri, Legislation.
Identifiers: Common enemy rule.

Appellant, private landowner, appealed from an action by a special road district in which a mandatory injunction had been granted compelling the landowner to remove a levee and to permanently enjoin him from constructing a levee which would bar or impede the flow of water in the area of a public road. The action resulted from the construction of a private road by the landowner which in effect became a levee that caused the public road to be inundated. Landowner asserted an unqualified right to construct and maintain the private road by reason of the 'common enemy doctrine'. The special road district contended that the private road created a public nuisance, or in the alternative, that a state statute created an exception to the doctrine when a public road is involved. The appellate court in dissolving the injunction failed to find a public nuisance, reasoning that if the road were found to be a public nuisance because of the stoppage of the flow of surface water over the landowner's property then the whole doctrine on which the right of stoppage of surface water is based would be overthrown. The court also held that the Missouri statute did not abrogate the 'common enemy doctrine' in cases involving public roads. (Gragg-Florida)
W74-02523

ENVIRONMENTAL DEFENSE FUND, INC. V. FROEHLKE (ACTION BROUGHT FOR DECLARATORY JUDGMENT AND INJUNCTION RESTRAINING COMPLETION OF RESERVOIR PROJECT).

477 F.2d 1033-1037 (8th Cir. 1973). 5 p.

Descriptors: *Judicial decisions, *Dams, *Environmental effects, *Federal, *Arkansas, Navigation, Comprehensive planning, Dam construction, Structures, Ecology, Highway relocation, Preservation.
Identifiers: National Environmental Protection Act, Environmental impact statement, Injunctive relief.

Appellant, Environmental Defense Fund, Inc., sought an injunction restraining all construction of the Truman Dam and Reservoir Project on the Osage River in Missouri, pending the filing of an environmental impact statement by the Corps of Engineers in accord with National Environmental Policy Act. The court enjoined the Corps from proceeding with certain activities and contracts, but permitted them to continue on-going construction activities, road relocation, cemetery relocations, voluntary property acquisition and design contracts pending the filing of the final environmental impact statement. The Environmental Defense Fund appealed this partial injunction. The Court of Appeals affirmed the partial injunction finding that the trial court had not abused its discretion in granting limited injunctive relief. The court based its decision on the findings that the river and life within it would not be harmed while the environmental impact statement was being completed, and that only minimal environmental damage would be inflicted on the adjacent land during that period. (Gragg-Florida)
W74-02524

STATE OF MAINE V. M/V TAMANO (SUIT TO RECOVER DAMAGES INCURRED AS RESULT OF DISCHARGE INTO WATERS OF BAY).

357 F.Supp. 1097-1102 (D. Maine, S.D. 1973). 6 p.

Descriptors: *Oil spills, *Oil pollution, *Maine, Water pollution, State jurisdiction oil waste, Natural resources, Judicial decisions, Legal aspects, Oily water, Pollution abatement.

The state of Maine and the Board of Environmental Protection brought suit against defendant corporation for discharge from an oil tanker into the local bay. Plaintiffs sought damages in three categories: for damage to state owned property, for payment of third party claims and clean-up costs, and for the state and the state as trustee for the citizens of Maine of all natural resources. The third contention was contested by the defendants. The court recognized suits of a state, parens patriae, so that a state may care for its own in utilizing the bounties of nature within her borders because it technically owns these bounties. Thus, the defendants' protest was unsuccessful. (Daniels-Florida)
W74-02525

UNITED STATES V. LINDSAY (GOVERNMENT'S ACTION AGAINST CITY FOR ALLEGED VIOLATION OF REFUSE ACT AND NEW YORK HARBOR ACT, AND FOR CREATION OF PUBLIC NUISANCE).
357 F. Supp 784-794 (E.D. New York, 1973). 11 p.

Descriptors: *Sewage disposal, *Municipal wastes, *Sewage, *Refuse Act, *New York, Water pollution, Industrial wastes, New York Harbor Act, United States, Legislation, Judicial decisions, Governmental interrelations, Waste water disposal, Seepage, Regulation.

Plaintiff, United States Government, alleged violation of Refuse Act and New York Harbor Act and creation of a public nuisance against defendant City of New York. City's discharges from streets and sewers in liquid state flow into the surrounding navigable waters of United States. Plaintiff charged such disposal of industrial pollutants via the municipal sewer system is violation of Acts and a public nuisance under federal common law. Defendant city argued that it falls within the exemption clause which permits sewage in liquid state and further contended that federal common law may only be fashioned where no federal statute exists. The court found defendant city properly within the exemption clause even though the sewage contained some inorganic matter. The court was not prepared, at this time, to determine the defendant's claim that plaintiff may not resort to federal common law. (Daniels-Florida)
W74-02526

SEGARS V. CORNWELL (PROPERTY OWNER SUES FOR MALICIOUS PROSECUTION AGAINST CORPORATION).
196 S.E.2d 341-346 (Ct. App. Ga., Division No. 1, 1973). 6 p.

Descriptors: *Water law, *Land development, Judicial decision, Legal aspects, Recreation, *Georgia.
Identifiers: Intentional torts, Water rights (Nonriparian).

The plaintiff had purchased fifteen acres of land from the Swan Lake Development Company. The deed stated that the conveyance included lake privileges. Due to errors in the legal description, a second deed was written in which, however, the sentence concerning the lake privileges was omitted. For a time, the plaintiff paid to the defendant developer an assessment for the upkeep of the recreational facilities; when he ceased the payments, the defendant forbade him use of the lake and ultimately swore out a warrant for his arrest, charging him with criminal trespass. The plaintiff successfully defended the charge and then sued the defendant for malicious prosecution. The court found that when a subdivision is developed and sold by an owner by the establishment of a general scheme, in reliance upon which the lots are purchased, an obligation rests upon the developers to make such land use available to all purchasers equally. The court concluded that the subdivision was planned, the lake constructed, and the recreation areas set aside for the purpose of selling lots so that if the lots were contiguous to the waterfront or not, the defendant could not deny the plaintiff access to the lake. (McKnight-Florida)
W74-02527

A BILL TO PRESCRIBE PROCEDURES SO AS TO MAKE ADMINISTRATION OF THE NATIONAL ENVIRONMENTAL POLICY ACT OF 1969 MORE EFFECTIVE.

House Bill No. 5974, 93rd Cong, 1st Sess, March 21, 1973. 10 p.

Descriptors: *Legislation, *Administration, *United States, *Environment, *Environmental effects, Effects, Administrative agencies, Environmental control, Ecology, Social aspects, Legal aspects, Political aspects, Water policy, Water law, Administrative decisions, Regulation, Federal government.
Identifiers: National Environmental Policy Act of 1969, Environmental impact statement.

Amendments were proposed to the National Environmental Policy Act of 1969 (Act) so as to make administration of the Act more effective. The amendments proposed that the Act be clarified to more precisely define the procedural requirements placed upon federal departments and agencies so as to eliminate delay, duplication and overlap, as well as to weigh environmental values with other public interests and values and to balance environmental values with other national policies and goals. Specifically, the amendments require that in connection with any proposed federal legislation or major federal action significantly affecting the quality of the human environment, an environmental impact statement will be developed assessing the environmental impact of the proposed legislation, adverse environmental effects, and alternatives to the proposed action. (Glickman-Florida)
W74-02528

A BILL TO AUTHORIZE THE SECRETARY OF THE INTERIOR TO CONSTRUCT, OPERATE, AND MAINTAIN THE POLLOCK-HERREID UNIT, SOUTH DAKOTA PUMPING DIVISION, MISSOURI RIVER BASIN PROJECT, SOUTH DAKOTA.

Senate Bill No. 1577, 93rd Cong, 1st Sess, April 13, 1973. 2 p.

Descriptors: *River basins, *River basin development, *Irrigation, *Water supply, *South Dakota, Land management, Water supply, Irrigation, Operation and maintenance, Irrigation systems, Water storage, Structures, Reservoir construction, Reservoir operation, Reservoir sites, Reservoir, Reservoir storage, Wildlife conservation, Legislation, United States.
Identifiers: Missouri River Basin Project.

A bill authorizes the Secretary of the Interior to construct, operate and maintain the Pollock-Herreid unit, South Dakota pumping division of the Missouri River Basin project for the purposes of irrigation, municipal and industrial water supply and fish and wildlife enhancement. The principal works of the project include the main pumping plant, the storage reservoir, a system of main canals and laterals, a regulating reservoir, seven relift pumping plants and the necessary drainage facilities. CITY OF HOLLYWOOD V. YARBOROUGH (REVIEW OF PUBLIC SERVICE COMMISSION ORDER AUTHORIZING UTILITY TO PROVIDE WATER SERVICE IN UNINCORPORATED AREA WHICH PETITIONER CLAIMED TO HAVE EXCLUSIVE CONTROL OVER).

274 So. 2d 526-529 (Fla. 1973).

Descriptors: *Florida, *Public utilities, *Water works, *Water supply, Water distribution (Applied), Regulation, Competition, Judicial decisions, Legal aspects, Cities, Legislation, Monopoly.

Identifiers: Notice, Public service commission.

The City of Hollywood (City) as petitioner brought suit challenging a Public Service Commission (Commission) order authorizing Modern Pollution Control, Inc. (Modern) to provide water service in an area over which the City of Hollywood alleged that it had exclusive control. The petitioner maintained that the Commission had exceeded its authority by assigning a portion of the City's territory to Modern. The court found that while the Commission is prohibited from asserting regulatory jurisdiction over the City, it is at the same time given jurisdiction over the issuance of certificates authorizing a utility to provide water services to the public and that this is so even when to do so will create competition with any other water system, if the Commission determines that such other system is inadequate to meet the reasonable needs of the public. In the situation at bar, the Commission was not, the court concluded, trying to regulate the operation of the City's water service, but only to provide water services to meet public needs in the area in question. Under these circumstances, any regulatory effect on the City was so indirect that it was overcome by the needs of the public so that the order in question was valid. (McKnight-Florida)

CANYON PUBLIC SERVICE DISTRICT V. TASA COAL COMPANY (EMINENT DOMAIN PROCEEDING HELD PUBLIC SERVICE DISTRICT HAD RIGHT TO CONDEMN DEFENDANT'S LANDS FOR USE IN CONNECTION WITH SEWER FACILITIES, DEFENDANT APPEALS).

195 S.E.2d 647-653 (Sup. Ct. App. W.Va. 1973).

Descriptors: *Eminent domain, *Condemnation, *Public utility district, Sewerage disposal, Public utilities, Sewage districts, Judicial decisions, Sewerage, *West Virginia.

Plaintiff, a public service district, brought eminent domain proceeding against defendant corporation to condemn defendant's lands for use in connection with sewer facilities. Defendant contended that plaintiff was not a legally constituted public service district because: less than 100 voters resided and owned property in the district at the time of its creation; petitioner was created solely for the purpose of supplying water; and the order fixing the date for hearing didn't comply with statutory requirements. Court found no merit in the first contention since the county court could create the district on its own motion. On the other questions, the court held that substantial compliance with statutory requirements was sufficient but since the district was created only for the purpose of furnishing water services, it had no power to condemn real estate for sewage facilities. (Daniels-Florida)

KELLY V. ALPSTETTEN ASSOCIATION, INC. (ACTION TO ENJOIN TERMINATION OF WATER SERVICE, WHEREIN DEFENDANT COUNTERCLAIMED FOR BACK CHARGES).
303 A.2d 136-139 (Vt. 1973).

Descriptors: *Spring waters, *Water rights, *Prescriptive rights, Water service, Injunction, Water supply, Underground water, Public utilities, Water distribution (Applied), Judicial decisions, Legal aspects, *Vermont.

Plaintiff brought a declaratory action seeking to prevent the shutting off of water to premises owned by him and to have his rights to take water from the system declared. The defendant, owner of the water system, countered, seeking to establish a duty in the plaintiff to pay for his water service and to confirm the defendant corporation's right to terminate service. The state supreme court held that where the issue of whether defendant was entitled to shut off water to premises owned by plaintiff depended on factual determination with respect to public nature of defendant not made by trial court in granting an injunction, remand was necessary for such determination. STATE V. PLACID OIL COMPANY (ACTION BY STATE TO ESTABLISH ITS OWNERSHIP OF SUBMERGED LANDS).

274 So. 2d 402-432 (Ct. App. La. 1973).

Descriptors: *Louisiana, *Judicial decisions, *Submerged lands, Leases, Oil industry, Natural resources, Exploitation, Oil reservoirs, Ownership of beds, Boundaries (Property), High water mark, Low water mark, Watercourses (Legal aspects).

A petitory action by the State of Louisiana and its mineral lessee to have the state declared the owner of parcels of land lying below ordinary high-water-mark of a body of water alleged to be a stream is described. Plaintiff also asked for an accounting of proceeds of oil wells drilled by the defendant oil companies on the subject property. The Court of Appeals prospectively applied a 1952 statute. The statute indicated that any ownership changes which resulted from a change of course of a navigable stream which followed the date of the 1956 mineral lease from the state were without prejudice to the lessee's interest with respect to the owners of such land or water bottoms. As a result the action was remanded for the limited purpose of permitting the litigants to establish the ordinary low-water mark in the areas of controversy as of the date of the 1956 lease. Moreover, the court emphasized that the statute was not unconstitutional as long as it was given prospective and not retrospective effect. (Mockler-Florida)

LEVEES AND DRAINS--CHANGE OF WATER--COURSES.
Indiana Ann. Stat. secs 48-4602 thru 48-4651 (Supp. 1972).

Descriptors: *Indiana, *Statutes, *Levees, *Drainage, Water control, Legal aspects, Flood control, Drainage systems, Routing, Water distribution, Water conveyance, Supply, Transfer, Water supply, Water utilization, Roads.

Indiana Annotated statutes deal with levees, drains, and changes of watercourses. The statutes provide that the board of public works may appropriate land for the purpose of constructing a levee for the prevention of the overflow of lands and may also build a street upon the levee. Moreover, when land is appropriated for this purpose, the board is authorized to adopt a resolution declaring that purpose and to proceed with the proper plans and specifications for the proposed works, which records shall be open to the public. Final orders, damages, benefits, appeal procedures, assessments and liens, contracts, with landowners, drainage improvement proceedings, hearings, notice requirements, petitioning procedures, and the right to acquire property for the completion of work or improvements are also dealt with by the statutes and applicable annotations. (Mockler-Florida)
W74-02536

SOIL AND WATER CONSERVATION DISTRICTS.
Ala. Code tit 2, secs 659 (1) thru 663 (Supp. 1971).

Descriptors: *Legislation, *Soil conservation, *Alabama, *Erosion control, Administration, Jurisdiction, Land use, Planning, Soil erosion, Vegetation establishment, Soil stabilization, Conservation, Land development.

An act by the Alabama Legislature changes the name of the State Soil Conservation Committee and Soil Conservation districts, create soil and water conservation districts, disannexes territory from one district and includes it in another, and changes the name of several soil districts. Moreover, the Act provides that a soil and water conservation district organized under the provisions of this chapter shall constitute a governmental subdivision of the state and a public body corporate and politic, exercising public powers, and such districts shall have the power to carry out preventive and control measures including engineering operations, methods of cultivation, the growing of vegetation, changes in use of land, and other erosion control measures on lands owned or controlled by the state. It may also conduct surveys, investigations, and research relating to the character of soil erosion and the preventive and control measures needed; publish the results of such surveys; and disseminate information concerning such preventive and control measures. (Mockler-Florida)
W74-02537

SUBMERGED LANDS.
43 U.S.C. secs 1301 thru 1343 (1970).

Descriptors: *Legislation, *Submerged lands, *United States, *Continental shelf, Tidal waters legal aspects, Jurisdiction, Governments, Intergovernmental relations, Oil leases.

These are the United States Code sections dealing with submerged lands. The statutes provide that it is in the public interest that title to and ownership of the lands beneath navigable waters within the boundaries of the respective states, the natural resources within such lands and waters, and the right and power to manage, administer, lease, develop, and use the lands and natural resources be confirmed and established. Moreover, the statutes provide that the Constitution and laws of the United States are extended to the subsoil and seabed of the outer continental shelf and to all artificial islands and fixed structures which may be erected thereon for the purpose of exploring for, developing, removing, and transporting resources therefrom, to the same extent as if the Outer Continental Shelf were an area of exclusive federal jurisdiction located within a state. The statutes also provide for seaward boundaries of states, rights and powers retained by the United States, administration of leasing, validation and maintenance of prior leases, and granting of leases by the Secretary of the Interior. C. F. Leaf, and G. E. Brink.
USDA Forest Service Research Paper RM-107, May, 1973. 23 p. 1 tab, 10 fig, 1 append, 20 ref.

Descriptors: *Forest watersheds, *Watershed management, Hydrologic systems, *Simulation analysis, Model studies, *Water balance, *Computer models, Computer programs, Snowmelt, Evapotranspiration, Vegetation effects, Forest management, Coniferous forests, *Colorado.
Identifiers: Subalpine hydrology.

A simulation model specifically designed to determine the probable hydrologic changes resulting from watershed management in the Colorado subalpine zone is described. The model simulates the total water balance on a continuous year-round basis and compiles the results from individual hydrologic response units into a composite overview of an entire drainage basin. Preliminary results for an 8-year test period on a 667-acre experimental watershed are summarized. (Brown-IPC)

AN ENCLOSED WEIR FOR SMALL STREAMS IN SNOW COUNTRY,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
K. L. Johnson, and R. D. Tabler.
USDA Forest Service Research Note RM-238, May 1973. 8 p. 7 fig, 2 ref.

Descriptors: Watershed management, *Weirs, *Flow measurement, *Winter, *Streamflow, Engineering structures, Costs, Operating costs, Capital costs, Snow.
Identifiers: Measurement systems.

An enclosed, sharp-crested, V-notch weir was designed to gage small channels under severe winter conditions at reduced costs of installation and operation. The self-contained structure consists of a multiplate pipe arch with closed ends fitted over and independent cutoff wall. The instrument shelter is mounted directly on the arch over a stilling well assembly placed within the weir basin. The structure provides trouble-free winter operation. Compared to a conventional design, the time of construction was reduced 50% and total costs by 40%. (Brown-IPC)

SAMPLING TECHNIQUES IN CHROMATOGRAPHY,
Waterloo Univ. (Ontario). Dept. of Chemistry.
F. W. Karasek.
Research Development, Vol 24, No 9, p 54-57, September 1973. 4 fig, 15 ref.

Descriptors: *Gas chromatography, *Sampling, Mechanical equipment, Instrumentation, Valves.
Identifiers: *Sample injection, Syringes, Liquid chromatography.

Methods and problems associated with sample introduction in gas chromatography are discussed. The most widely used method employs a syringe to inject the sample through a septum. Reproducibility is plus or minus 1 percent. However, problems such as septum leakage, sample blowback in the syringe, and nonlinear volatilization of sample may destroy the accuracy of results. Valves have also been developed for sample injection. These can perform many thousands of sample injections (versus 50-80 for a septum) and can be used for backflushing, column or sample selection, detector switching, and concentration techniques. Valves also are frequently used in process chromatographs under automatic control and provide reproducibility of better than plus or minus 1 percent. Many of the procedures used with GC are useful for liquid chromatography. (Little-Battelle)

Geological Survey, Washington, D.C.
C. J. Massoni, R. V. Fones, and F. O. Simon.
Review of Scientific Instruments, Vol 44, No 9, p 1350-1352, September 1973. 2 fig.

Descriptors: *Instrumentation, *Automatic control, Reliability.
Identifiers: *Gamma ray spectroscopy, Sample changers.

The capacity of gamma-ray spectroscopy equipment was increased by the addition of a gravity-fed, pneumatic-ejection sample changer. The changer is designed for solid samples which are placed in polyethylene rabbits 1.65 cm in diam and 5.50 cm long. These are made by cutting off the hinge and opening tab from a 7.4-ml polyethylene vial. Operation of the changer and the associated electronics are described. The electronic circuitry has a fail-safe feature which stops the operation of the changer if a malfunction occurs. The system has proved to be more than 99 percent reliable. (Little-Battelle)

AN IMPROVED BOTTOM-WATER SAMPLER,
University Coll. of Swansea (Wales). Dept. of Geology and Oceanography.
J. R. Joyce.
Journal of the Marine Biological Association of the United Kingdom, Vol 53, No 3, p 741-744, August 1973. 1 fig, 6 ref.

Descriptors: *Sampling, Mechanical equipment, Water, Design criteria, Sea water, Fabrication, *Water sampling, Bottom sampling.

Identifiers: *Bottom water sampler.

A sampler for collecting water at predetermined points above the sediment-water interface consists of a frame containing six inverted PVC bottles. The bottom of each bottle has a hole drilled in it which is fitted with a simple perspex flap valve. Silico-rubber tubing is attached to the neck of each bottle and passes through a trigger bar which is connected to an actuating weight and two support bars. The tubes pass through holes in the side plating at different (interchangeable) levels to collect samples at predetermined points above the sediment. The sampler can be actuated at any depth. This device has been successfully used in a study of the Tawe estuary, where a bottom layer of high-turbidity, low-salinity water has been discovered. (Little-Battelle)

AERIAL REMOTE SENSING OF CARBONATE TERRANES IN SHELBY COUNTY, ALABAMA,
Geological Survey, University, Ala.
W. M. Warren, and C. C. Wielchowsky.
Ground Water, Vol 11, No 6, p 14-26, November-December 1973. 8 fig, 17 ref.

Descriptors: *Remote sensing, *Terrain analysis, *Karst, *Alabama, *Land subsidence, Mapping, Surveys, Topography, Geologic mapping, Radar, Aerial photography, Karst hydrology, Structural geology, Hydrogeology.
Identifiers: Shelby County (Ala).

Remotely sensed data are used by the Geological Survey of Alabama in the study of subsidence and collapse problems in several carbonate terranes. Active areas in Shelby County, Alabama, were delineated by on-the-ground inspection and by use of airborne remote sensors. These active terranes present problems to those who presently live in the area as well as to those who will be involved in the future development of this region; therefore, techniques must be found that can be used to predict subsidence and collapse. In a 70-square-mile test area in the county aerial infrared photography, thermography, and side-looking airborne radar (SLAR) imagery can be used for (1) locating, inventorying, and monitoring sinkholes; (2) predicting potential collapses; (3) mapping fracture traces, lineaments, regional geologic structure, and alignment of sinkholes; and (4) assisting general project planning. Time and effort can be saved by using remote-sensing techniques because large areas can be examined in a very short period of time. (Knapp-USGS)

A NEW AQUATIC INSECT TRAP,
Union Carbide Corp., Tarrytown, N.Y.
A. W. Fast.
Mich Acad. Vol 5, No 1, p 115-124. 1972. Illus.
Identifiers: *Aquatic insects, *Insect traps, Lakes, Midges, Oxygen, Periphyton, Predation.

A submerged insect trap is described and compared with another type of submerged trap. Six variations of the trap are compared. Submerged suspended traps are basically inefficient and should not be used. Submerged bottom traps should be used in deep water. Floating box traps, tent traps and pyramid traps may be used in shallow water. If floating pyramid or bottom traps are used, the contents of the entire trap must be collected. In some weedy areas, a floating trap is the only appropriate kind. Traps should be serviced and moved daily to prevent losses due to decomposition, predation and sinking. Daily servicing will also avoid oxygen depletion and reduced recruitment problems. Clear plastic or screened traps should be used rather than opaque traps. Traps that cut off both light and water circulation lead to oxygen depletion and cessation of emergence. Traps that cut off water circulation appear to lead to reduced recruitment. Traps should be dried out periodically to prevent periphyton growths and midge attachment.--Copyright 1973, Biological Abstracts, Inc.

ERTS-1 IMAGE CONTRIBUTES TO UNDERSTANDING OF GEOLOGIC STRUCTURES RELATED TO MANAGUA EARTHQUAKE, 1972,
Geological Survey, Washington, D.C.
W. D. Carter, and G. P. Eaton.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Administration Rept NASA SP-327, p 459-471, 1973. 8 fig, 1 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Geologic mapping, *Earthquakes, *Structural geology, Surveys, Disasters, Faults (Geologic), Data collections, Hazards.
Identifiers: ERTS, *Managua (Nicaragua).

ERTS-1 imaged the western portion of Nicaragua on December 24, 1972, one day after the central part of the city of Managua was devastated by a major earthquake which measured 5.6 on the Richter scale. ERTS-1 images reveal four sets of lineaments (which may reflect fault systems) among any one of which movement could have taken place. One set, trending N 50 deg W, includes a line of active volcanoes that parallels the coast and constitutes the southwestern edge of the Nicaraguan Depression, a regional graben which cuts obliquely across the Central American isthmus. A parallel lineament, north of Lake Managua, marks the northeast edge of the graben. A less conspicuous set is represented by only three identified members within Nicaragua. Two others, which are subparalle, are visible on the image in the area of Honduras, to the northwest. This set is notable for the fact that it extends from the coast entirely across the Nicaraguan Depression. This set is represented by four currently active, left-lateral, strike-slip faults and a narrow belt of aftershock epicenters. (See also W74-01663 and W74-02562 thru W74-02604) (Knapp-USGS)

RECOGNITION OF SURFACE LITHOLOGIC AND TOPOGRAPHIC PATTERNS IN SOUTHWEST COLORADO WITH ADP TECHNIQUES,
Purdue Univ., Lafayette, Ind. Lab. for Applications of Remote Sensing.
W. N. Melhorn, and S. Sinnock.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 473-481, 1973. 4 fig, 1 tab, 4 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Geologic mapping, *Structural geology, *Terrain analysis, Topography, Surveys, Mapping, Geomorphology, Data collections, Colorado.
Identifiers: ERTS.

Analysis of ERTS-1 multispectral data by automatic pattern recognition procedures is applicable in studies of resource stresses by providing a means for refining existing geologic maps. Machine recognition of extensive surface lithologic and topographic patterns is possible. Automatic mapping of a series of hogbacks, strike valleys, and alluvial surfaces along the northwest flank of the San Juan basin in Colorado was obtained in a test study by man-machine interaction using minimal human input. The determination of causes for separable spectral signatures is dependent upon extensive correlation of field-based ground truth observations and aircraft underflight data with the satellite data. (See also W74-02561) (Knapp-USGS)
W74-02562

ERTS-1 IMAGERY AS AN AID TO THE DEFINITION OF THE GEOTECTONIC DOMAINS OF THE SOUTHERN AFRICAN CRYSTALLINE SHIELD,
Johannesburg Consolidated Investment Co. Ltd., Randfontein (South Africa). Geological Research Dept.
M. J. Viljoen, and R. P. Viljoen.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 483-491, 1973. 6 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Structural geology, *Geologic mapping, Surveys, Mapping, Data collections, Africa, Terrain analysis, Geomorphology.
Identifiers: ERTS, *South Africa.

ERTS data can be used to identify ancient granite-greenstone cratons and the metamorphic mobile belts, the two major geotectonic units of the Southern African Crystalline Shield. Each has its own distinctive structural style. The broad synoptic view provided by ERTS imagery is ideally suited to a study of the diagnostic macrostructures, and the different geotectonic styles are clearly recorded. ERTS-1 imagery thus allows a more accurate definition than exists at present of the contact zones and internal structures of the two domains. (See also W74-02561) (Knapp-USGS)

NEW ASPECTS ON THE TECTONIC OF THE ALPS AND THE APENNINES REVEALED BY ERTS-1 DATA,
Zentralstelle fuer Geo-Photogrammetrie und Fernerkundung, Munich (West Germany).
J. Bodechtel, and B. Lammerer.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 493-399, 1973. 7 fig.

Descriptors: *Remote sensing, *Satellite (Artificial), *Geologic mapping, *Structural geology, *Alpine, Mountains, Geomorphology, Terrain analysis, Data collections, Faults (Geologic), Surveys.
Identifiers: ERTS, *Alps.

The Alpine region is one of the most complicated and best investigated parts of the world. Therefore, it is very interesting to compare the ground truth with data revealed by ERTS-1 imagery. Large lineaments shown by ERTS are not influenced by nappe systems or specific rock properties. Therefore, they can be assumed to have been formed during a very late stage of the Alpine orogeny. Their occurrence in pairs and their straight courses give strong evidence for shearing movement. The whole Alpine body has been affected by a compressing force after nappe trans-

port, and the locally detected strike-slip faults are now shown by ERTS to belong to a hugh and extended shearing system. This system is not limited to the Alps, but it extends to the molasse foreland. In this foreland with its weak sediments, faults and fractures are difficult to detect. ERTS-1 imageries show the pattern of lineaments very clearly. These lineaments often end at the Alpine margin or the folded part of the molasse. This folded part of the molasse probably buffered the stress down to the amount in which a shearing system could develop instead of folding or nappe overthrusts. The knowledge of the tectonic evolution and the structural pattern of the molasse may become important for petroleum prospecting. (See also W74-02561) (Knapp-USGS)
W74-02564

STRUCTURAL LINEAMENTS OF GASPE FROM ERTS IMAGERY,
R. Steffensen.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 501-515, 1973. 5 fig, 13 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Geologic mapping, *Structural geology, Canada, Surveys, Data collections, Faults (Geologic), Stratigraphy, Geomorphology.
Identifiers: ERTS, *Gaspe.

A test study was conducted to assess the value of ERTS images for mapping geologic features of the Gaspe Peninsula, Quebec. Of the four spectral bands of the multispectral scanner, the band from 700 to 800 nanometers, which seems to possess the best informational content for geologic study, was selected for analysis. Structural lineaments were outlined and classified according to five categories: morpho-lithologic boundaries, morpho-lithologic lineaments, fault traces, fracture zones and undefined lineaments. Comparison with the geologic map of Gaspe shows that morpho-lithologic boundaries correspond to contacts between regional stratigraphic units. Morpho-lithologic lineaments follow bedding trends, whereas fracture traces appear as sets of parallel lineaments, intersecting at high angles the previous category of lineaments. Fault traces mark more precisely the location of faults already mapped and spot the presence of faults not indicated on the geologic map. As a tool for mineral exploration the structural lineaments map of Gaspe can be used to improve the understanding of the tectonic framework of the Peninsula, to direct exploration efforts over specific target areas, to assist in deciphering the meaning of geophysical survey data, and to support the delineation of trends in the distribution of regional geochemical anomalies. (See also W74-02461) (Knapp-USGS)
W74-02565

LINEAMENTS IN COASTAL PLAIN SEDIMENTS AS SEEN IN ERTS IMAGERY,
Geological Survey, Reston, Va. EROS Program Office.
C. F. Withington.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 517-521, 1973. 1 fig, 1 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Coastal Plains, *Geologic mapping, *Structural geology, Virginia, Maryland, Earthquakes, Data collections.
Identifiers: ERTS.

Examination of satellite imagery over the Atlantic Coastal Plain near Washington, D.C., shows numerous lineaments, which cannot be accounted for by any known cultural or natural features. At least some of these lineaments represent the surface expression of faults, for one of them has been correlated with the outcrop of a fault that had been traced for several miles in southern Prince Georges County, Maryland. If a substantial number of these lineaments do indeed represent fault traces, the fact that they show on the surface suggests that the geologic history of the Coastal Plain is much more complex than has previously been recognized, and that faulting may have occurred in the Holocene, much later than has generally been recognized. The importance that such recent movements could have on future development of the Coastal Plain should emphasized. (See also W74-02561) (Knapp-USGS)

In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 523-530, 1973. 8 fig, 17 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Exploration, *Surveys, Geologic mapping, Structural geology, Mining, Oil fields, Data collections, Data processing, Mapping, Terrain analysis.
Identifiers: ERTS.

Five areas in North America (North Slope-Alaska, Superior Province-Canada, Williston basin-Montana, Colorado and New Mexico-West Texas) are being studied for discernibility of geological evidence on ERTS-A imagery. ERTS data are compared with known mineral and hydrocarbon accumultions to determine the value of the imagery in commercial exploration programs. Clearly discernible structural lineaments in New Mexico-West Texas are evident on the photographs. Comparison of this evidence with known major mining localities in New Mexico indicates a clear pattern of coincidence between the lineaments and mining localities. In West Texas, lineament and geomorphological evidence obtainable from the photographs define the petroleum-productive Central Basin Platform. ERTS-A imagery should be extremely valuable in defining the regional and local structure in any commercial exploration program. (See also W74-02561) (Knapp-USGS)
W74-02567

STRUCTURAL INTERPRETATIONS BASED ON ERTS-1 IMAGERY, BIGHORN REGION, WYOMING-MONTANA,
Iowa Univ., Iowa City. Dept. of Geology.
R. A. Hoppins.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 531-538, 1973. 3 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Structural geology, *Geologic mapping, Surveys, Wyoming, Montana, Data collections, Terrain analysis, Geomorphology, Mapping.
Identifiers: *Bighorns (Wyo-Mont), ERTS.

Structural analysis of the Bighorn region of Wyoming and Montana is being carried out on ERTS bands MSS 5 and 7. Geologic structure is primarily revealed in topographic relief and drainage. Topographic linears are particularly well developed in the Bighorn uplift. Many of these occur along known faults and shear zones in the Precambrian core; several have not been previously mapped. These linears, however, do not continue into the younger rocks of the flanks or do so in a much less marked manner than in the core. Linears are far less abundant in the basin or are minifested only in very subtle tonal contrasts and straight drainage segments. Some of the linears are aligned along trends previously postulated on the basis of surface mapping to be lineaments. The imagery reveals little or no evidence of strike-slip displacements along these lineaments. Larger folds show up very well. (See also W74-02561) (Knapp-USGS)
W74-02568

APPLICABILITY OF ERTS-1 TO LINEAMENT AND PHOTOGEOLOGIC MAPPING IN MONTANA--PRELIMINARY REPORT,
Montana Univ., Missoula.
R. M. Weidman, D. D. Alt, R. E. Flood, Jr., K. T. Hawley, and L. K. Wackwitz.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 539-546, 1973. 4 fig, 5 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Structural geology, *Geologic mapping, Surveys, Wyoming, Montana, Data collections, Terrain analysis, Geomorphology, Mapping.
Identifiers: ERTS.

A lineament map prepared from a mosaic of western Montana shows about 85 lines not represented on the state geologic map, including elements of a northeast-trending set through central western Montana which merit ground truth checking and consideration in regional structural analysis. Experimental fold annotation resulted in a significant local correction to the state geologic map. Photogeologic mapping studies produced only limited success in identification of rock types, but they did result in the precise delineation of a late Cretaceous or early Tertiary volcanic field (Adel Mountain field) and the mapping of a connection between two granitic bodies shown on the state map. Imagery was used successfully to map clay pans associated with bentonite beds in gently dipping Bearpaw Shale. ERTS imagery should be used to facilitate preparation of a statewide tectonic map. Satellite imagery mapping, aided by ground calibration, provides an economical means to discover and correct errors in the state geologic map. (See also W74-02561) (Knapp-USGS)
W74-02569

A NEW FAULT LINEAMENT IN SOUTHERN CALIFORNIA,
California Univ., Riverside. Dept. of Geography.
R. W. Pease, and C. W. Johnson.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 547-552, 1973. 6 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Structural geology, *Earthquakes, Geologic mapping, Mapping, Faults (Geologic), Data collections, Seismic studies, California.
Identifiers: ERTS.

ERTS-1 imagery clearly shows a 50-mile-wide tectonic zone across Southern California oriented about 15 deg to the structures of the Transverse Ranges or with an azimuth of 70 deg. The zone is delineated on the imagery by terrain alignments and vegetational differences. A previously undisclosed tectonic lineament extends across the Mojave Desert and appears as a line of crustal upwarping. Pressures which would have caused this plus the occurrence of many thrust faults with the 70 deg azimuth indicate this to be a zone of crustal compression. Recent earthquake epicenters appear to be related to this compression zone rather

than the traditional fault network of Southern California. (See also W74-02561) (Knapp-USGS)
W74-02570

FRACTURE MAPPING AND STRIP MINE INVENTORY IN THE MIDWEST BY USING ERTS-1 IMAGERY,
Geological Survey, Bloomington, Ind.
C. W. Wier, F. J. Wobber, O. R. Russell, and R. V. Amato.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A: National Aeronautics and Space Admin Rept NASA SP-327, p 553-560, 1973. 4 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Mining, *Structural geology, Strip mines, Indiana, Environmental effects, Land conservation, Hazards, Data collections.
Identifiers: ERTS.

ERTS-1 imagery and high-altitude infrared photography yield useful fracture data in Indiana and Illinois despite a glacial till cover. ERTS MSS bands 5 and 7 are most useful for fracture mapping in coal-bearing rocks in this region. A reasonable correlation can be made between fractures and mine roof-fall accidents. Information related to surface-mined land, such as disturbed area, water bodies, and kind of reclamation, may also be derived from the analysis of ERTS imagery. (See also W74-02561) (Knapp-USGS)
W74-02571

ERTS-1 INVESTIGATION OF ECOLOGICAL EFFECTS OF STRIP MINING IN EASTERN OHIO,
Bendix Corp., Ann Arbor, Mich.
P. E. Chase, and W. Pettyjohn.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A: National Aeronautics and Space Admin Rept NASA SP-327, p 561-568, 1973. 4 fig, 2 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Strip mining, *Mapping, *Environmental effects, Ecology, Surveys, Ohio, Data collections, Data processing.
Identifiers: ERTS.

ERTS data were used to detect, map, and monitor the effects of strip mining. Enlarged ERTS imagery and statistically processed data (outline maps and imagery) of stripped earth and standing water were compared to aerial photos of a strip mine near Coshocton, Ohio. The outline maps and decision imagery may be used to form a disruption map of recently mined and underclaimed earth. (See also W74-02561) (Knapp-USGS)
W74-02572

THE USE OF ERTS-1 MSS DATA FOR MAPPING STRIP MINES AND ACID MINE DRAINAGE IN PENNSYLVANIA,
Pennsylvania State Univ., University Park. Office for Remote Sensing of Earth Resources.
J. S. Alexander, D. Dein, and D. P. Gold.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A: National Aeronautics and Space Admin Rept NASA SP-327, p 569-575, 1973. 2 tab, 10 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Strip mining, *Mapping, *Acid mine water, Pennsylvania, Environmental effects, Land reclamation, Ecology, Surveys, Data collections, Data processing.
Identifiers: ERTS.

Digital processing of ERTS-1 MSS data for areas near the west branch of the Susquehanna River permits identification of stripped areas including ones that are not discernible from visual analysis of ERTS imagery. Underflight data and ground-based observations are used for ground truth. Because of associated diagnostic effects on vegetation, seasonal changes in classification criteria are being documented as repeated, cloud-free ERTS-1 coverage of the same area becomes available. Preliminary results indicate that ERTS data can be used to monitor not only the total extent of stripping in given areas but also the effectiveness of reclamation and pollution abatement procedures. (See also W74-02561) (Knapp-USGS)
W74-02573

MONITORING VEGETATION COVER ON MINE DUMPS WITH ERTS-1 IMAGERY: SOME INITIAL RESULTS,
Spectral Africa (Pty) Ltd., Randfontein (South Africa).
B. Gilbertson.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A: National Aeronautics and Space Admin Rept NASA SP-327, p 577-584, 1973. 6 fig, 2 tab.

Descriptors: *Remote sensing, *Satellites (Artificial), *Mining, *Mine wastes, *Waste dumps, Surveys, Mapping, Vegetation effects, Land reclamation.
Identifiers: *South Africa, ERTS.

ERTS-1 imagery is being used in an attempt to differentiate between mine dumps having varying degrees of vegetative cover. The various dumps can be located and identified, and differences in vegetative cover can be seen and measured. Patterns of vegetative growth, some characteristic to particular dumps, can also be seen. Therefore, mine dumps can be differentiated with respect to their vegetative cover on the imagery received to date. Subsequent imagery showing seasonal variations should facilitate this program. (See also W74-02561) (Knapp-USGS)
W74-02574

REMOTE DETECTION OF AEROSOL POLLUTION BY ERTS,
Old Dominion Univ., Norfolk, Va. Dept. of Geophysical Sciences.
G. E. Copeland, A. R. Bandy, E. C. Kindle, R. N. Blais, and G. M. Hilton.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A: National Aeronautics and Space Admin Rept NASA SP-327, p 585-592, 1973. 6 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Air pollution, *Path of pollutants, Surveys, Smoke, Data collections.
Identifiers: ERTS.

ERTS-1 MSS imagery of Eastern Virginia coupled with extensive ground truth air quality and meteorological data may be used for identification and surveying of particulate air-pollution sources (smoke plumes). The quantitative monitoring of smokestacks from orbital altitudes over state size regions appears possible when tied to realistic plume models and minimal ground truth. Data collected over urban areas can possibly be utilized to produce isopleths of particulates when supplemented by local measurements. (See also W74-02561) (Knapp-USGS)
W74-02575

DETECTION, MAPPING AND ESTIMATION OF RATE SPREAD OF GRASS FIRES FROM SOUTHERN AFRICAN ERTS-1 IMAGERY,
Forest Management Inst., Ottawa (Ontario).
J. M. Wightman.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A: National Aeronautics and Space Admin Rept NASA SP-327, p 593-601, 1973. 4 fig, 1 tab.

Descriptors: *Remote sensing, *Satellites (Artificial), *Grasslands, *Burning, Surveys, Monitoring, Mapping, Africa, Data collections.
Identifiers: ERTS.

ERTS band-6 imagery of the Zambesi basin of southern Africa recorded substantial changes in burn patterns resulting from late dry season grass fires. One example from northern Botswana indicates that a fire consumed approximately 70 square miles of grassland over a 24-hour period. Another example from western Zambia indicates increased fire activity over a 19-day period. Other examples clearly define the area of widespread grass fires in Angola, Botswana, Rhodesia and Zambia. From the fire patterns visible on the sequential portions of the imagery, and the time intervals involved, the rates of spread of the fires were estimated and compared with estimates derived from experimental burning plots in Zambia and Canada. Sequential ERTS-1 imagery, of the quality studied, clearly provides the information needed to detect and map grass fires and to monitor their rates of spread in this region during the late dry season. (See also W74-02561) (Knapp-USGS)
W74-02576

MAPPING ATLANTIC COASTAL MARSHLANDS, MARYLAND, GEORGIA, USING ERTS-1 IMAGERY,
American Univ., Washington D.C. Dept. of Biology.
R. R. Anderson, V. Carter, and J. McGinness.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A: National Aeronautics and Space Admin Rept NASA SP-327, p 603-613, 1973. 7 fig, 3 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Wetlands, *Mapping, *Surveys, Monitoring, Marshes, Data collections, Vegetation.
Identifiers: ERTS.

ERTS provides an opportunity to test the feasibility of mapping wetlands using small scale imagery. The test sites selected were in Chesapeake Bay, Maryland, and Ossabaw Island, Georgia. The upper wetland boundary drainage patterns, plant communities, including Spartina alterniflora, Spartina patens, and Juncus roemerianus, ditching activities, and lagooning were identified. ERTS is an excellent tool for many types of coastal wetland mapping. (See also W74-02561) (Knapp-USGS)
W74-02577

IDENTIFICATION OF MARSH VEGETATION AND COASTAL LAND USE IN ERTS-1 IMAGERY,
Delaware Univ., Newark. Coll. of Marine Studies.
V. Klemas, F. Daiber, and D. Bartlett.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A: National Aeronautics and Space Admin Rept NASA SP-327, p 615-627, 1973. 8 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Wetlands, *Mapping, *Surveys, Monitoring, Marshes, Data collections, Vegetation.
Identifiers: ERTS.

Coastal vegetation species appearing in the ERTS-1 images taken on Delaware Bay on August 16 and October 10, 1972, were correlated with ground truth vegetation maps and imagery obtained from high altitude RB-57 and U-2 overflights. Five vegetation communities could be clearly dis-

criminated, including: (1) salt marsh cord grass; (2) salt marsh hay and spike grass; (3) reed grass; (4) high tide bush and sea myrtle; and (5) a group of freshwater species found in impoundments built to attract waterfowl. Spectral discrimination capabilities of ERTS-1 imagery compare favorably with those of aerial infrared photography, and spatial resolution is the dominant factor limiting the potential for detailed vegetation mapping using ERTS-1 imagery. (See also W74-02561) (Knapp-USGS)
W74-02578

APPLICATION OF ERTS-1 DATA TO THE PROTECTION AND MANAGEMENT OF NEW JERSEY'S COASTAL ENVIRONMENT,
Earth Satellite Corp., Washington, D.C. Geosciences and Environmental Applications Div.
R. L. Mairs, F. J. Wobber, D. Garofalo, and R. Yunghans.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A: National Aeronautics and Space Admin Rept NASA SP-327, p 629-634, 1973.

Descriptors: *Remote sensing, *Satellites (Artificial), *Monitoring, *Water pollution, New Jersey, Wetlands, Beaches, Path of pollutants, Water pollution sources, Mapping, Data collections.
Identifiers: ERTS.

ERTS-1 imagery is being used by the New Jersey Department of Environmental Protection to develop information that will assist the state in managing its coastal resources. Initial analyses of imagery from several successive ERTS-1 orbits show the extent, predominant drift, and dispersion characteristics of waste disposal in coastal New Jersey waters. Imagery (MSS bands 4 and 5) for several orbits shows the New York Harbor tidal discharge extending as far south as Long Branch, New Jersey. Increased reflectance of turbid waters shows the effects of a large sewage effluent flow. As these waters are flushed with each tidal change, the turbid waters emanate out to the populous bathing beaches. (See also W74-02561) (Knapp-USGS)
W74-02579

MONITORING OCEAN DUMPING WITH ERTS--1 DATA,
Environmental Research Inst. of Michigan, Ann Arbor.
C. T. Wezernak, and N. Roller.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A: National Aeronautics and Space Admin Rept NASA SP-327, p 635-641, 1973. 2 fig, 5 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Monitoring, *Path of pollutants, Waste disposal, Water pollution sources, Data collections.
Identifiers: *Ocean dumping (Wastes), ERTS.

Large volumes of municipal and industrial wastes are disposed of by means of dumping at sea. Disposal of wastes by barge dumping frequently produces surface films and waste fields whose fate and effects are not adequately defined. Frequently very large areas of the marine environment are affected. ERTS-1 data for the New York Bight were collected on August 16, 1972. Acid-iron wastes, sewage sludge, suspended solids, and major water mass boundary features could be seen in the study area. The surface movement of the wastes and the location of major water mass boundaries may be monitored. Synoptic coverage of the type available from satellite altitudes can be expected to contribute towards an understanding of surface circulation patterns in the area. (See also W74-02561) (Knapp-USGS)
W74-02580

ENVIRONMENTAL STUDY OF ERTS-1 IMAGERY: LAKE CHAMPLAIN AND VERMONT,
Vermont Univ., Burlington.
A. O. Lind, E. B. Henson, and J. Pelton.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A: National Aeronautics and Space Admin Rept NASA SP-327, p 643-650, 1973. 8 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Water pollution, *Land use, Surveys, Investigations, Monitoring, Vermont, Data collections, Lakes, Path of pollutants, Water pollution sources.
Identifiers: *Lake Champlain, ERTS.

Industrial water pollution and turbidity in Lake Champlain were identified and mapped using ERTS data. ERTS imagery also provides a foundation for revising land use inventories which will be necessary for meeting some of the informational needs of the Land Use and Land Capability Act (Act 250). Major classes of land use were identified and mapped, and substantial progress was made toward the mapping of such land use divisions as crop and forest type and wetlands. (See also W74-02561) (Knapp-USGS)
W74-02581

WATER TURBIDITY DETECTION USING ERTS-1 IMAGERY,
Geological Survey, Lawrence, Kans.
H. L. Yarger, J. R. McCauley, G. W. James, L. M. Magnuson, and G. R. Marzolf.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A: National Aeronautics and Space Admin Rept NASA SP-327, p 651-658, 1973. 5 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Turbidity, *Reservoirs, Kansas, Monitoring, Water quality, Data collections, Surveys, Great Plains, Water management (Applied), Suspended load.
Identifiers: ERTS.

ERTS-1 images of two federal reservoirs in Kansas exhibit good correlation with suspended load. The major reservoirs in Kansas, as well as in other Great Plains states, are playing increasingly important roles in flood control, recreation, agriculture, and urban water supply. Satellite imagery may prove useful for acquiring timely low cost water quality data required for optimum management of these freshwater resources. (See also W74-02561) (Knapp-USGS)
W74-02582

DIGITAL ANALYSIS OF POTOMAC RIVER BASIN ERTS IMAGERY: SEDIMENTATION LEVELS AT THE POTOMAC-ANACOSTIA CONFLUENCE AND STRIP MINING IN ALLEGHENY COUNTY, MARYLAND,
American Univ., Washington, D.C. Dept. of Biology.
J. S. Schubert, and N. H. MacLeod.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A: National Aeronautics and Space Admin Rept NASA SP-327, p 659-664, 1973. 1 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Data processing, *Potomac River, *Strip mines, Water pollution, Sedimentation, Monitoring, Data collections, Maryland.
Identifiers: ERTS.

Two simple algorithms for classification of sedimentation levels in water and for delineation of active strip mines are used with ERTS data for sedimentation analysis of the Anacostia River, the Potomac River, and mud flats resulting from effluent of a major sewage treatment plant. Mud flats or organic or mineral origin are easily distinguished. Several classes of sedimentation are easily constructed. In imagery of Allegheny County, Maryland, strip mines occur in rural areas where open fields are on the dissected Allegheny plateau, forests are more generally in stream channels below. The mines are cut into the horizontal contour of the valley slopes and are easily distinguished from their surroundings. (See also W74-02561) (Knapp-USGS)
W74-02583

A STUDY ON THE EROSION OF NIIGATA BEACH FROM ERTS-A IMAGERY,
Tokyo Univ. (Japan). Inst. of Industrial Science.
T. Maruyasu.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A: National Aeronautics and Space Admin Report NASA SP-327, p 665-672, 1973. 6 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Beach erosion, Monitoring, Data collections, Surveys, Mapping, Littoral drift.
Identifiers: Niigata Beach (Japan), ERTS.

One of the causes of coastal erosion can be construction works such as flood control dams, short cut channels, or breakwaters, which reduce the transportation of river silt sand. ERTS-A imagery shows the relations between the status of erosion, effluent patterns affected by the coastal current, and cultural construction works. The Niigata alluvial plain, on the Japan Sea, is produced by the Shinano River and the Agano River. The shoreline at the west beach has eroded 360 meters in 60 years since the completion of the breakwater, while the shoreline at the east beach has eroded 300 meters in 40 years since the construction of the Ohkozu short cut channel. (See also W74-02561) (Knapp-USGS)
W74-02584

APPLICATION OF ERTS DATA TO THE DETECTION OF THIN CIRRUS AND CLEAR AIR TURBULENCE,
Japan Meteorological Agency, Tokyo.
K. Tsuchiya, and T. Kamiko.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A: National Aeronautics and Space Admin Rept NASA SP-327, p 673-680, 1973. 7 fig, 2 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Clouds, *Turbulence, *Air circulation, Winds, Weather, Meteorology, Atmospheric physics, Data collections.
Identifiers: *Clear air turbulence, ERTS.

Thin cirrus and clear air turbulence were studied using ERTS MSS data. Thin cirrus not shown in a conventional meteorological satellite picture can be revealed in ERTS MSS pictures. The cores of jet streams can be located with high accuracy from ERTS Pictures, and the possible area of clear air turbulence can be predicted. (See also W74-02561) (Knapp-USGS)
W74-02585

POLLUTED AND TURBID WATER MASSES IN OSAKA BAY AND ITS VICINITY REVEALED WITH ERTS-A IMAGERIES,
Kyoto Gakuen Univ. (Japan).
K. Watanabe.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A: National Aeronautics and Space Admin Rept NASA SP-327, p 681-687, 1973. 4 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Monitoring, *Water pollution, *Surveys, Path of pollutants, Bays, Data collections, Currents (Water).
Identifiers: *Osaka Bay (Japan), ERTS.

Water pollution is one of the most serious problems in Osaka Bay, Japan, and its vicinity. However, the state of water pollution there has never been monitored because conventional point-to-point observations do not detect periodical movement of water masses with a fairly strong tidal current. ERTS-A provides very valuable MSS imagery of Osaka Bay and its vicinity. In the MSS-4 and MSS-5 imageries a complex pattern of water masses can be seen. Some patterns are easily identified from their shapes as cloud covers or polluted water masses. A simple method distinguishes water masses from cloud cover and from noise caused by sunlight reflected from wave surfaces. The polluted water does not diffuse continuously into the oceanic water but forms masses. A front between an oceanic water mass and a polluted water mass runs NW-SE in the center of Osaka Bay. (See also W74-02561) (Knapp-USGS)
W74-02586

RED TIDE IN ISE BAY,
Toba Merchant Marine Coll. (Japan).
H. Ochiai.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A: National Aeronautics and Space Admin Rept NASA SP-327, p 689-693, 1973. 5 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Red tide, *Surveys, Monitoring, Data collections, Water pollution, Turbidity.
Identifiers: *Ise Bay (Japan), ERTS.

From October 5 to October 26, 1972, the northwestern part of Ise Bay was seriously affected by red tide. The boundary of red tide was mapped using several imageries produced from ERTS-1 data. The green band with 0.50-0.60 wavelength detects clear water. The transparency distribution of Ise Bay shows that the area along the western coast near Yokkaichi was in poor condition, while the green band imagery shows two patterns extended to the northeast and southeast like belts; these are the areas of red tide. (See also W74-02561) (Knapp-USGS)
W74-02587

HYDROGEOLOGY OF CLOSED BASINS AND DESERTS OF SOUTH AMERICA, ERTS-1 INTERPRETATIONS,
Geological Survey, Washington, D.C.
G. E. Stoertz, and W. D. Carter.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A: National Aeronautics and Space Admin Rept NASA SP-327, p 695-705, 1973. 4 fig, 2 tab, 2 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Water resources, Deserts, Snowpacks, Playas, Watersheds (Divides), Watersheds (Basins), Hydrogeology, Topography, Floods, Structural geology, Geologic mapping, Runoff forecasting, Geomorphology, South America, Data collections.
Identifiers: ERTS, Chile, Bolivia, Argentina, Peru.

Images from Earth Resources Technology Satellite (ERTS-1) contain data useful in studies of hydrogeology, geomorphology, and paleoclimatology. Deserts and semidesert areas in southwestern Bolivia, northwestern Argentina, northern Chile, and southeastern Peru were studied using data taken from July 30 to November 17, 1972. Hydrologic applications of ERTS imagery include (1) mapping of salars or salt-encrusted playas, which represent water discharges from closed drainage basins; (2) mapping of drainage divides, particularly around closed basins in dry regions; (3) mapping of geologic structural data; (4) revision of geologic maps to show hydrologically important differences in surficial deposits; (5) revision of hydrologic features on topographic maps; (6) monitoring seasonal changes in floodwaters to evaluate areal and seasonal changes in weather, climate, and water resources; (7) mapping of mountain snowpacks; and (8) relation of permanent drainage basin characteristics to seasonal snow cover and floodwater as an aid in estimating water resources of basins lacking meteorological or stream-gaging stations. (See also W74-02561) (Knapp-USGS)
W74-02588

DETECTION OF MAJOR RIVER BED CHANGES IN THE RIVER EBRO (NORTH-EASTERN SPAIN),
R. Espejo, J. Torrent, and C. Roquero.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A: National Aeronautics and Space Admin Rept NASA SP-327, p 707-711, 1973. 3 fig, 1 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Meanders, *Alluvial channels, *Monitoring, Stream erosion, Sedimentation, Flood plains, Data collections.
Identifiers: ERTS, Ebro River (Spain).

The River Ebro is the most important water course in Spain. Major river bed changes were studied over a distance of 30 km either side of the city of Zaragoza using ERTS data. Image quality was good enough to permit a clear identification of the river course, and bands MSS 5 and 7 proved to be the most useful for this purpose. Repetitive coverage by means of satellites can help monitor river changes. ERTS-1 imagery also serves as a source for the detection and selection of areas of newly deposited alluvial materials. (See also W74-02561) (Knapp-USGS)
W74-02589

APPLICATIONS OF MULTISPECTRAL IMAGERY TO WATER RESOURCES DEVELOPMENT PLANNING IN THE LOWER MEKONG BASIN (KHEMER REPUBLIC, LAOS, THAILAND AND VIET-NAM),
Economic Commission for Asia and the Far East (UN), Bangkok (Thailand). Mekong Committee Secretariat.
W. J. van Liere.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A: National Aeronautics and Space Admin Rept NASA SP-327, p 713-741, 1973. 6 fig, 10 photos.

Descriptors: *Remote sensing, *Satellites (Artificial), *Water resources development, Planning, Deltas, Sedimentation, Floods, Drainage, Data collections, Soil surveys, Surveys, Monitoring.
Identifiers: ERTS, *Mekong Delta.

ERTS imagery is used for water resources planning in the lower Mekong basin. It complements data from areas which have been inaccessible in the past. It refines ground surveys, mainly of land forms and soils of existing and planned irrigation projects. It provides new information, which would be almost or entirely impossible to detect with ground surveys or conventional photography; this includes the mechanism of flooding and drainage of the delta, siltation of the Great Lake, acidity and salinity in the lower delta, and fisheries in the estuarine areas. The satellite data are particularly valuable also because their repetitive coverage gives an insight in the gradual transformation of changing features such as the extent of flooding and moisture retention in various soil types. (See also W74-02561) (Knapp-USGS)
W74-02590

APPLICATION OF ERTS-1 IMAGERY TO FLOOD INUNDATION MAPPING,
Iowa State Geological Survey, Iowa City. Remote Sensing Lab.
G. R. Hallberg, B. E. Hoyer, and A. Rango.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 745-753, 1973. 3 fig, 3 tab, 3 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Floods, *Mapping, Monitoring, Data collections, Iowa, Flood data, Flood plains.
Identifiers: ERTS, *Flood mapping, Nishnabotna River (Iowa).

In September, 1972, heavy rains initiated major flooding in southwestern Iowa, concentrated in the East and West Nishnabotna basins. Ground data and a variety of low-altitude multispectral imagery were acquired for the East Nishnabotna River on September 14-15. This successful effort showed that a near-visible infrared sensor could map inundated areas in late summer for at least three days after flood recession. ERTS-1 imagery of the area was obtained on September 18-19. Analysis of MSS imagery reinforced the conclusions of the low-altitude study while increasing the time period critical for imagery acquisition to at least seven days following flood recession. The capability of satellite imagery to map late summer flooding at a scale of 1:250,000 is exhibited by the agreement of interpreted flood boundaries obtained from ERTS-1 imagery to boundaries mapped by low-altitude imagery and ground methods. The synoptic coverage of ERTS-1 allowed extension of the flood mapping to the West Nishnabotna River. Satellite imagery allows rapid appraisal of the areal extent of flood inumdation for entire river systems. (Knapp-USGS)
W74-02591

ASSESSMENT OF FLOOD DAMAGE IN ARIZONA BY MEANS OF ERTS-1 IMAGERY,
Geological Survey, Denver, Colo.
R. B. Morrison, and M. E. Cooley.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 755-760, 1973, 6 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Floods, Arizona, Surveys, Mapping, Damages, Sedimentation, Monitoring, Flash floods, Data collections.
Identifiers: ERTS, *Flood mapping.

ERTS-1 MSS images clearly show two important effects of a large flood in southeastern Arizona--the extent of inundation and the areas affected by severe sediment deposition and erosion--although the images were made a week and a half after the flood. On October 20 and 21, 1972, the upper Gila River had its third largest flood on record. The first ERTS-1 images after the flood were made on November 1 and 2. The inundated area is best displayed on the infrared bands, particularly on band 7, where it appears as a belt along the river that is distinctly darker than adjoining parts of the flood plain. This dark belt does not appear on ERTS images that predate the flood. Presumably the low infrared reflectance of this belt is caused by still-moist soil and by flood-stressed vegetation. Inundation limits mapped from ERTS imagery agree well with those obtained by aerial photography during the flood and by ground surveys. Areas of severe sand and gravel deposition show best on band 5. By comparing before and after flood images in this band, a quick assessment can be made of the severely flood-ravaged land. ((See also W74-02561) Knapp-USGS)
W74-02592

USE OF THE SRI ELECTRONIC SATELLITE IMAGE ANALYSIS CONSOLE FOR MAPPING SOUTHERN ARIZONA PLANT COMMUNITIES FROM ERTS-1 IMAGERY,
Geological Survey, Tucson, Ariz.
R. M. Turner.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 761-768, 1973. 5 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Vegetation, *Mapping, Arizona, Ecology, Data collections, Biological communities, Plant populations.
Identifiers: ERTS, *Plant community mapping.

Cloud-free imagery covering the Tucson, Ariz., region for the period from August 22 to November 2, 1972, was used to determine the utility of ERTS-1 data for discriminating boundaries between plant communities. Color composites from MSS-5 and MSS-6 bands were recorded photographically. The color photographs were then used to compare with short-term changes in vegetative cover observed on the ground. Microdensitometric traces were made along selected traverses to quantify changes in scene irradiance across the image field. MSS-6 minus MSS-5 densitometry values were employed as a relative measure of plant cover in the wide range of vegetative zones covered by the traverses. (SEE also W74-02561) (Knapp-USGS)
W74-02593

MONITORING OF STREAMFLOW IN THE VERDE RIVER BY ERTS-1 DATA COLLECTION SYSTEM (DCS),
Geological Survey, Phoenix, Ariz. Water Resources Div.
H. H. Schumann.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 769-776, 1973. 3 fig.

Descriptors: *Remote sensing, *Telemetry, *Satellites (Artificial), *Stream gages, Gaging stations, Arizona, Streamflow, Water levels, Data collections, Data processing.
Identifiers: ERTS, *Verde River (Ariz).

The U.S. Geological Survey in cooperation with the Salt River Valley Water Users Association installed a specially designed gaging station on the Verde River near the town of Camp Verde to evaluate near-real time streamflow data furnished by ERTS-1. The installation is equipped with a Stevens digital water-level recorder, modified for telemetry, and an ERTS-1 data collection platform operating in the digital-parallel mode. During the 43-day period between November 3 and December 15, 1972, the DCS relayed 552 transmissions during 193 data passes. The DCS system transmitted stream-stage information 4.5 times per day on the average. The amount of data received far exceeded the expected single high quality transmission rate of once per 12-hour period from the DCS system. Data are sufficient to accurately compute daily mean gage heights. These, in turn, are used to compute the average daily streamflow rates during stable or slowly changing flow conditions. The digital-parallel DCS data have also furnished useful information during peak-flow periods. (See also W74-02561) (Knapp-USGS)
W74-02594

PRELIMINARY ANALYSIS OF ERTS--RELAYED WATER-RESOURCES DATA IN THE DELAWARE RIVER BASIN,
Geological Survey, Harrisburg, Pa.
R. W. Paulson.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 777-792, 1973. 7 fig.

Descriptors: *Remote sensing, *Telemetry, *Satellites (Artificial), *Stream gages, *Observation wells, Water quality, Pennsylvania, Data collections, Hydrologic data, Data processing, Delaware River.
Identifiers: ERTS.

In the Delaware River basin, the ERTS data collection system is performing well. Data collection platforms have been successfully interfaced with five stream-gaging stations and three groundwater observation wells and are being interfaced with 12 water-quality monitors in the basin. Data are being relayed during four or five ERTS orbital passes per day, which is within the design specifications of the ERTS-DCS. (See also W74-02561) (Knapp-USGS)
W74-02595

AN EVALUATION OF SPACE ACQUIRED DATA AS A TOOL FOR MANAGEMENT OF WILDLIFE HABITAT IN ALASKA,
Bureau of Sport Fisheries and Wildlife, Washington, D.C.
B. J. Van Tries.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 795-799, 1973.

Descriptors: *Remote sensing, *Satellites (Artificial), *Ducks (Wild), *Aquatic habitats, Marshes, Ponds, Lakes, Wetlands, Alaska, Wildlife habitats, Data collections, Data processing, Surveys, Monitoring.
Identifiers: ERTS.

ERTS-1 data collection techniques were tested for predictions of waterfowl populations in the fall migration in Alaska. Baseline data which are essential to the State in many aspects of their land use planning functions are also provided. The quantity, quality, and distribution of waterfowl breeding habitat are assessed through frequent ERTS measurements of hydrologic, phenological and vegetational parameters. Basic mapping of vegetation and terrain are possible in certain remote areas of the State for which little or no biological data now exist. The Bureau of Sport Fisheries and Wildlife ERTS-1 experiment on waterfowl habitat is based on the accepted theory that a reliable correlation exists between the 'degree of wetness' (number of ponds and wetlands) existing in July and annual production of birds. (See also W74-02561) (Knapp-USGS)
W74-02596

PRELIMINARY EVALUATION OF ERTS-1 FOR DETERMINING NUMBERS AND DISTRIBUTION OF PRAIRIE PONDS AND LAKES,
Environmental Research Inst. of Michigan, Ann Arbor.
E. A. Work, Jr., D. S. Gilmer, and A. T. Klett.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 801-808, 1973. 5 fig, 6 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Ponds, *Grasslands, Lakes, North Dakota, Mapping, Surveys, Data collections, Data processing, Ducks (Wild), Wildlife habitats, Wetlands.
Identifiers: ERTS.

ERTS-1 and aircraft multispactral data collected over a North Dakota test site during July, 1972, were compared to evaluate the capability of the satellite sensors to detect numbers and sitribution of prairie ponds and lakes. Surface water areas larger than two acreas may be recognized. The proportion estimation technique improves the accuracy of area determination and small pond detection. (See also W74-02561) (Knapp-USGS)
W74-02597

DYNAMICS OF PLAYA LAKES IN THE TEXAS HIGH PLAINS,
Texas Tech Univ., Lubbock. Dept. of Geosciences.
C. C. Reeves, Jr.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 809-817, 1973. 6 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Playas, *Lakes, Great Plains, Surveys, Mapping, Wetlands, Water balance, Data collections, Ecology.
Identifiers: ERTS, *High Plains (Tex).

Satellite imagery can be used for a census of the lake basins which commonly exist in semiarid areas and which sporadically contain water at various times of the year. Storm paths and runoff collected by such lake basins can also be closely monitored, the accuracy dependent on periodicity of the orbits and the size of the basins. Study of the relationships between spectral differences (obtained from ERTS-1 imagery) and the water balance ecosystem of these lake basins in the High Plains of Texas is in a preliminary stage. ERTS-1 MSS band 4 has the poorest tonal contrast in semiarid West Texas, band 5 is best of definition of vegetation, band 6 is best for defining large water areas, and band 7 is best for counting small lake basins with water. Ground truth studies reveal significant differences between the test sites, the relative importance of which is reflected by the hydrologic balance of each lake basin. (See also W74-02561) (Knapp-USGS)
W74-02598

STUDIES IN THE LAKE ONTARIO BASIN USING ERTS-1 AND HIGH ALTITUDE DATA,
Guelph Univ. (Ontario).
A. Falconer, S. H. Collins, W. T. Dickison, R. Protz, and R. P. Bukata.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 819-828, 1973. 4 fig, 15 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Lake Ontario, Surveys, Mapping, Land use, Geomorphology, Sedimentation, Water circulation, Soil moisture, Monitoring, Data processing, Data collections, Hydrologic data, Great Lakes region, Water balance, Planning, Water management (Applied).
Identifiers: ERTS, *Lake Ontario basin.

ERTS studies in the Lake Ontario basin are designed to provide input for models of river basin discharge and macroscale features of lake circulation. High altitude imagery is needed to record the dynamic features of Lake Ontario so that ERTS-1 data may be interpreted. Soil moisture, land use, soils, sediments, and geomorphology data are available on a regional scale from ERTS-1 products. (See also W74-02561) (Knapp-USGS)
W74-02599

PROGRESS OF AN ERTS-1 PROGRAM FOR LAKE ONTARIO AND ITS BASIN,
Environmental Research Inst. of Michigan, Ann Arbor.
T. W. Wagner, and F. C. Polcyn.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National

Aeronautics and Space Admin Rept NASA SP-327, p 829-836, 1973. 5 fig, 5 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Lake Ontario, Surveys, Mapping, Land use, Geomorphology, Sedimentation, Water circulation, Soil moisture, Monitoring, Data processing, Data collections, Hydrologic data, Great Lakes region, Water balance, Planning, Water management (Applied).
Identifiers: ERTS, *Lake Ontario basin.

The Lake Ontario drainage basin covers over 32,000 square miles of U.S. and Canadian territory. ERTS-1 data are contributing to the comprehensive study of this basin as part of the International Field Year for the Great Lakes (IFYGL). The processing approach used for obtaining detailed and objective synoptic information applicable to terrestrial water balance studies of such a large area is discussed. A simple ratio algorithm was tested for minimizing daily variations in ERTS data and for allowing the discrimination of surface features and land use classes of hydrologic significance. These steps are necessary if ERTS data are to provide the quantitative information required for the study and management of areas of regional size. (See also W74-02561) (Knapp-USGS)
W74-02600

REMOTE SENSING OF TURBIDITY PLUMES IN LAKE ONTARIO,
Geological Survey, Arlington, Va.
E. J. Pluhowski.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 837-846, 1973. 8 fig, 4 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Lake Ontario, *Turbidity, Surveys, Path of pollutants, Water circulation, Mapping, Monitoring, Data collections, Currents (Water).
Identifiers: ERTS, Genesee River, Welland Canal, Oswego River.

Preliminary analyses of ERTS-1 imagery demonstrates the utility of the satellite to monitor turbidity plumes generated by the Welland Canal, and the Genesee and Oswego Rivers. Although visible in high altitude photographs, the Niagara River plume is not readily identifiable from satellite imagery. (See also W74-02561) (Knapp-USGS)
W74-02601

ERTS-1 VIEWS THE GREAT LAKES,
Wisconsin Univ., Milwaukee. Air Pollution Analysis Lab.
V. A. Lyons, and S. R. Pease.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol I--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 847-854, 1973. 5 fig.

Descriptors: *Remote sensing, *Satellites (Artificial), *Great Lakes region, *Air pollution effects, Meteorology, Data collections, Air pollution, Clouds, Precipitation (Atmospheric), Snow, Weather.
Identifiers: ERTS.

The meteorological content of ERTS images, particularly mesoscale effects of the Great Lakes and air pollution dispersion, is summarized. Summertime lake breeze frontal clouds and various winter lake-effect convection patterns and snow squalls are revealed in great detail. A clear-cut spiral vortex over southern Lake Michigan is related to an early snowstrom in the Chicago area. Marked cloud changes induced by orographic and frictional effects on Lake Michigan's lee shore snow squalls may be seen. The most important finding, however, is a clear-cut example of alterations in cumulus convection by anthropogenic condensation nuclei from steel mills during a snow squall situation. Jet aircraft condensation trails are also found frequently. (See also W74-02561) (Knapp-USGS)
W74-02602

USE OF ERTS DATA FOR MAPPING SNOW COVER IN THE WESTERN UNITED STATES,
Environmental Research and Technology, Inc., Lexington, Mass.
J. C. Barnes, and C. J. Bowley.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NASA SP-327, p 855-862, 1973. 7 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Snow cover, *Snow surveys, Mapping, Runoff forecasting, Monitoring, Terrain analysis, Mountains.
Identifiers: ERTS.

ERTS data are evaluated for mapping snow cover, primarily in the mountainous areas of the western United States. The specific objectives are to determine the spectral interval most suitable for snow detection, to determine the accuracy with which snow lines can be mapped in comparison with the accuracies attainable from other types of measurements, and to develop techniques to differentiate reliably between snow and clouds, and to understand the effects of terrain and forest cover on snow detection. The MSS-5 spectral band is the most useful for detecting and mapping mountain snow cover. Snow cover can be readily detected and can be distinguished from clouds. In addition to various natural features, manmade features such as roads, electric powerlines, cultivated fields, and timber cuts are visible. Several glaciers along the coasts of Greenland exhibit a uniform reflectance in the MSS-4 band, whereas in the MSS-7 band the lower elevation parts appear much darker than the higher elevations. This difference in reflectance is believed to be due to the existence of melt water on the surface of the lower parts of the glaciers as opposed to snow cover on the upper parts. (See also W74-02561) (Knapp-USGS)
W74-02603

EVALUATION OF ERTS IMAGERY FOR MAPPING AND DETECTION OF CHANGES OF SNOWCOVER ON LAND AND ON GLACIERS,
Geological Survey, Tacoma, Wash.
M. F. Meier.
In: Symposium on Significant Results Obtained from the Earth Resources Technology Satellite-1: Vol 1--Technical Presentations, Sect A, National Aeronautics and Space Admin Rept NSAS SP-327, p 863-875, 1973. 6 fig, 9 ref.

Descriptors: *Remote sensing, *Satellites (Artificial), *Snow cover, *Snowpacks, *Glaciers, Surveys, Snow surveys, Runoff forecasting, Data collections, Mapping, Glaciation, Mountains.
Identifiers: ERTS.

The snow cover area on drainage basins was measured from ERTS imagery by video density slicing with a repeatability of 4%. Data from ERTS images of the melt season snow cover in the Thunder Creek drainage basin in the North Cascades were combined with existing hydrologic and meteorologic observations to enable calculation of the time distribution of the water stored in this mountain snowpack. Similar data could be used for frequent updating of expected inflow to reservoirs. Equivalent snowline altitudes were determined from area measurements. Snowline altitudes were also determined by combining enlarged ERTS images with maps with an accuracy of about 60 m under favorable conditions. Ability to map snow cover or to determine snowline altitude depends primarily on cloud cover and vegetation and secondarily on slope, terrain roughness, sun angle, radiometric fidelity, and amount of spectral information available. ERTS imagery was also used to measure glacier accumulation area, detect subtle flow structures on glaciers, identify surgin glaciers, and monitor changes in tidal glacier termini. SYSTEM 21, 'JUPITER' (A DESIGN SYSTEM FOR TWO-DIMENSIONAL NEARLY-HORIZONTAL FLOWS),
Danish Hydraulic Inst., Copenhagen. Computational Hydraulics Center.
M. B. Abbott, A. Damsgaard, and G. S. Rodenhuis.
Journal of Hydraulic Research, Vol. 11, No 1, p 1-28, 1973. 7 fig, 26 ref.

Descriptors: *Computer programs, *Currents (Water), *Mathematical models, *Numerical analysis, Ocean currents, Winds, Ocean circulation, Beaches, Shores, Waves (Water).

An ensemble of mutually compatible routines for 2-dimensional flows organized into a single software entity can be installed on any large digital computer and used in a routine, repetitive way without any knowledge of its internal operation. Through such a system, advanced techniques of numerical analysis, programming and hardware can be made available to scientific and engineer users in a simple, cheap and reliable way. The system is capable of constructing a model of any region of two-dimensional nearly-horizontal flow, when presented only with the topography of the region, and of operating this model from given initial and boundary conditions, wind velocities, tidal-tractive forces, latitude, and other external conditions if required. It can provide a variety of output organizations: velocity plots and isoline plots for selected regions or the complete computational fields, as well as time variations of principal variables at selected points. FLOOD OF JUNE 1972 AT CORNING, NEW YORK,
Geological Survey, Washington, D.C.
K. I. Darmer, and L. A. Wagner.
For sale by USGS, Washington, D.C. 20242, Price $0.75.

Descriptors: *Floods, *Flood data, *Historic floods, *New York, Hydrologic data, Flood damage, Streamflow, Runoff, Flow rates, Peak discharge, Flood profiles, Rainfall, Gaging stations, Flood frequency, Maps, Photography.
Identifiers: *Corning (N.Y.).

This one-sheet atlas describes the greatest flood disaster in the history of New York which occurred during late June 1972 as a result of torrential rains brought by the remnants of Tropical Storm Agnes. The city of Corning, in southwest-central New York, was subjected to the full fury of the flood as crests from the Tioga, Canisteo, and Cohocton Rivers moved into the Chemung River at Corning. Heavy loss of life and property was sustained in the city of Corning and in nearby communities of Gang Mills, Painted Post, Riverside, and South Corning. Maps, graphs, tables and photographs show: bihourly (every 2 hours) precipitation at Hornell, New York, June 20-23, 1972; peak stages and discharges, Chemung River basin, June 23, 1972; peak flood stages above agage height 18.0 feet, Chemung River at Corning, New York, 1865-1972; floodflows entering Chemung River at Corning, June 23, 1972; flood-frequency, Chemung River basin, New York; profiles of floods on Cohocton, Tioga and Chemung Rivers; and flooding in vicinity of Warren and East William Streets in Corning, June 1972. (Woodard-USGS)

HYDROLOGY AND WATER RESOURCES OF THE NEPONSET AND WEYMOUTH RIVER BASINS, MASSACHUSETTS,
Geological Survey, Washington, D.C.
R. A. Brackley, W. B. Fleck, and W. R. Meyer.
For sale by USGS, Washington, D.C., 20244, Price $1.00 per set. Hydrologic Investigations Atlas HA-484, 3 sheets, 1973. 5 map, 1 tab, 25 ref.

Descriptors: *Water resources development, *Hydrologic data, *Surface waters, *Groundwater resources, *Massachusetts, River basins, Water quality, Water supply, Streamflow, Aquifer characteristics, Water yield, Planning, Flood data, Peak discharge, Low flow, Stream gages, Water analysis, Chemical analysis, Maps, Hydrographs.
Identifiers: *Neponset River basin (Mass.), *Weymouth River basin (Mass.).

This 3-sheet atlas describes the water resources of parts of Massachusetts. The goal of the investigation is to provide information for use in water-resources planning and to aid in the selection of sites for potential water-supply development. The investigation is subdivided into a series of river-basin studies. The regions included in this report are those parts of the Neponset, Weymouth Fore, and Weymouth Back River basins that are upstream from the tide-affected or heavily-urbanized areas of their lower basins. These streams drain the area south of Boston and flow in a northerly direction to Boston Harbor. The study area encompasses 135 square miles of gently rolling terrain having a local relief of generally 50 to 100 feet. Average precipitation is about 45 inches per year. Of this, about 22 inches is lost through evapotranspiration, about 20 inches is discharged from the area as streamflow, about 2 inches is piped out as sewage or for use outside the area, and the remainder leaves as groundwater underflow. Surface water and groundwater are generally soft to moderately hard and mildly acid. The major quality problems in most streams and in much of the groundwater are concentrations of iron and manganese that exceed the limits recommended for public water supplies by the U.S. Public Health Service. Journal of Hydraulic Research, Vol 11, No 2, p 157-166, 1973. 4 fig, 3 ref.

Descriptors: *Mixing, *Diffusion, *Dispersion, Open channel flow, Water temperature, Heat transfer, Turbulence, Turbulent flow, Uniform flow.

Measurement of temperature distribution, thermal diffusivity and temperature fluctuations were made in a uniform turbulent flow with a step change in temperature. The spread of temperature is described by a constant diffusion coefficient which when related to the local turbulence properties compares well with measurements in the core region of open channel flow. In practice this means that the dispersion of pollutants in the almost constant velocity regions in open channel flows and over short distances in the atmosphere can be predicted from a knowledge of the mean flow. Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY12, Paper 10224, p 2175-2184, December 1973. 4 ref.

Descriptors: *Scour, *Bridges, *Piers, *Channel erosion, *Stream stabilization, Hydraulics, Erosion, Floods, Sediment transport, Channel improvement, Alluvial channels, Streamflow, Aerial photography, Stream gages.

Several hydrologic evaluations are important for the design of bridge piers to protect them against streambed scour: (1) prediction of the local stage versus discharge relation: (2) determination of appropriate design floods, their recurrence intervals, and their stages: (3) selection of suitable streambed reference elevations; (4) assessment of hydrograph influences on channel stability with respect to channel alignment, streambed configuration, and streambed degradation; (5) evaluation of the effects of dams, dredging, and sand-and-gravel operations upon sediment transport near bridge piers; (6) evaluation of the effects of scour protection measures; and (7) anticipation of the magnitude of debris transport during floods as related to river stage and to watershed conditions. Method and difficulties in making these hydrologic evaluations are examined. The techniques considered rely mainly upon the development and analysis of stream-gaging records and the analysis of aerial photographs. (Knapp-USGS)

DAM-BREAK FLOOD IN A PRISMATIC DRY CHANNEL,
California Univ., Davis. Dept. of Engineering.
J. G. Sakkas, and T. Strelkoff.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY12, Paper 10233, p 2195-2216, December 1973. 11 fig, 21 ref, 3 append. USACE Contract DACW05-71-C-0103 Calif WRC W-259.

Descriptors: *Flood waves, *Dam failure, *Simulation analysis, Floods, Mathematical models, Unsteady flow, Open channel flow.

A mathematical model is presented for the prediction of the flood wave resulting from the instantaneous break of a dam in a prismatic, dry channel of general parabolic cross section. It consists of the numerical integration of the characteristic equations over the irregular grid formed by the characteristic lines using a predictor-corrector scheme. The solution is advanced towards the wave front by a gradual refinement of the characteristics net for reasons of accuracy and economy. Finally, the solution is extended over a short region to the wave tip, which is characterized by zero depth, using a simplified form of the momentum equation resulting from physical considerations in the wave-tip region. Computed results are compared with experimental and theoretical results obtained by others. Corroboration with experimental results is generally good. The solution can be advanced in time until the negative wave propagating into the still water reaches the upstream end of the reservoir. (Knapp-USGS)

FLOW IN OPEN CHANNELS WITH SMOOTH CURVED BOUNDARIES,
Pahlavi Univ., Shiraz (Iran). Dept. of Engineering.
M. S. Moayeri.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY12, Paper 10194, p 2217-2232, December 1973. 9 fig, 13 ref, append.

Descriptors: *Open channel flow, *Free surfaces, *Flow around objects, Equations, Weirs, Spillway crests, Flow profiles, Computer programs, Hydraulics, *Boundary processes.

A method of computing flow in open channels with curved transitions in cross section is illustrated by application to an example, the potential flow over a smooth step in an open channel. A detailed description of the flow is given by a pair of integro-differential equations in the free-surface and solid-boundary elevations, derived from the solution of a boundary-value problem of the Dirichlet type in an infinite strip in the complex potential plane. The use of numerical approximations to both the derivatives and integrals in the integro-differential equations leads to a system of simultaneous nonlinear algebraic equations, and this is then solved by a special method of successive approximation. Solutions are obtained for approach Froude numbers F ± 0.4 and 1.7. The computed output consists of the geometry of the free surface, the flow net within, and velocity components and pressure at any point in the flow. (Knapp-USGS)

BED SCOUR AT END-DUMP CHANNEL CONSTRICTIONS,
Alberta Univ., Edmonton. Dept. of Civil Engineering.
B. P. Das.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY12, Paper 10228, p 2273-2291, December 1973. 9 fig, 2 tab, 20 ref, append.

Descriptors: *Scour, *Alluvial channels, *Dams, Hydraulics, Erosion, *Channel erosion, Stream erosion, Rockfill dams.
Identifiers: Flow constrictions.

One method of constricting a channel is by end-dumping loose rockfill from one or both banks. Bed scour occurs around the leading face and downstream of such end-dumped dams built into alluvial channels. Analysis of the problem indicates the Froude number of approach flow, the contraction ratio, and the ratio of the maximum scoured depth to the normal flow depth to be the essential nondimensional variables. The maximum scoured depth is influenced also by the size and density of the bed sediment. On the basis of laboratory studies, the functional relationship was established and design curves are presented to directly determine the maximum scoured depth. The location of deepest scour and rate of scour are discussed. (Knapp-USGS)

ANALYSIS OF INTERNAL FLOW CHARACTERISTICS OF A SMOOTH-DISK WATER--BRAKE DYNAMOMETER,
National Aeronautics and Space Administration, Cleveland, Ohio. Lewis Research Center.
D. G. Evans.
Available from NTIS, Springfield, Va., 22151 as NASA TN D-7234 Price $3.00 printed copy; $1.45 microfiche. Technical Note D-7234, May 1973. 50 p, 17 fig, 2 tab, 6 ref, 6 append.

Descriptors: *Fluid mechanics, *Dynamometers, *Hydraulic models, *Flow characteristics, *Rotational flow, Turbulence, Viscous flow, Shear stress, Correlation analysis, Methodology, Submergence.
Identifiers: *Water brake, Rotating smooth disk, Dimensional analysis.

The principal of absorbing power with an enclosed partially submerged rotating disk through the turbulent viscous shearing of water is discussed. Reference information is used to develop a flow model of the water brake. A method is then presented that uses vector diagrams to relate the effects of rotational flow, through flow, and secondary flow to power absorption. The method is used to describe the operating characteristics of an example 111-cm (43.7 in) diameter water brake. Correlating performance parameters are developed in a dimensional analysis. THE QUANTITY AND DIMENSIONS OF MICROORGANISMS IN BOTTOM SEDIMENTS OF FISH-BREEDING PONDS (IN RUSSIAN),
Ukrainian Research Inst. of the Fish Industry, Kiev (USSR).
A. F. Antipchuk.
Gidrobiol Zh, Vol 8, No 2, p 63-67, 1972, Illus.
Identifiers: *Bacteria, *Bottom sediments, Breeding, *Microorganisms, Sediments, *Fish breeding ponds.

The relationship between the depth of microorganic sediments and the quantity of microorganisms was studied. As the depth increases, the quantity of microorganisms decreases, but the quantity of spores increases. The volume of rod-like bacteria changed very little with the depth, but the cocci volume increased with the depth.--Copyright 1973, Biological Abstracts, Inc.

THE HYDROLOGY OF TEN STREAMS IN WESTERN WASHINGTON AS RELATED TO THE PROPAGATION OF SEVERAL PACIFIC SALMON SPECIES,
Geological Survey, Tacoma, Wash.
M. R. Collings, and G. W. Hill.
Available from NTIS, Springfield, Va. 22151, PB-224 066; Price $3.00 printed copy; $1.45 microfiche. Water-Resources Investigations 11-73, 1973. 149 p, 77 fig, 21 tab, 29 ref.

Descriptors: *Fish migration, *Spawning, *Salmon, *Washington, Streamflow, Water quality, Streambeds, Data collections, Hydrology, Channel morphology, Stream fisheries, Evaluation, Environmental effects.
Identifiers: *Salmon spawning.

Basic to all other considerations related to the preservation and enhancement of the Pacific salmon runs in Washington are the quantitative and qualitative aspects of the streams utilized by the fish. First, there must be sufficient quantities of water for salmon propagation. Second, stream-hydraulic conditions of depth and velocity must be favorable for salmon spawning and rearing. Third, water quality must be favorable with regard to temperature, suspended sediment, dissolved oxygen, and the quantity of dissolved minerals. This is the third in a series of reports that discuss the results of investigations to determine preferred spawning and rearing discharges on selected streams in western Washington. Using preferred depth and velocity criterion previously determined by anadromous-fish biologists, 300 sets of measurements of depth, velocity, and discharge were obtained during 10 visits to three study reaches on each of 10 streams. The data were evaluated to determine the preferred spawning and rearing flows for fall chinook, spring chinook, sockeye and coho salmon. Documentation also was made of streambed-gravel sizes, water temperatures, suspended-sediment concentrations, dissolved-oxygen concentrations, and specific conductance. (Woodard-USGS)

W74-02407 7B

High Precision Sampling for Chromatographic Separations,
W74-02414 2K

An Automated Analysis for Urea in Seawater,
W74-02421 5A

AVALANCHE FORECASTING
Predicting Avalanche Intensity from Weather Data: A Statistical Analysis,
W74-02294 2C

AVALANCHES
Predicting Avalanche Intensity from Weather Data: A Statistical Analysis,
W74-02294 2C

AZOTOBACTER
Influence of Herbicides on Microbiological Conditions,
W74-02548 5B

BACTERIA
The Quantity and Dimensions of Microorganisms in Bottom Sediments of Fish-Breeding Ponds (In Russian),
W74-02228 8I

Microflora and Chemical Composition of the Bottom Deposits of the Kairak-Kum Reservoir, (In Russian),
W74-02253 5B

Hygienic Conditions in the Procurement of Drinking Water from Individual Sources (In German),
W74-02547 5B

The Effect of Organic Substrates on the Abundance of Bacteria in the Water of 5 Masurian Lakes,
W74-02556 5C

A Report on Bacterial Pollution Affecting Shellfish Harvesting in Newport River, North Carolina.
W74-02621 5B

BACTERIAL COMMUNITY
The Effect of Temperature on the Generation Time of a Bacterial Community in Lake Water,
W74-02557 5B

BACTERIAL DECOMPOSITION
The Ability of Bacteria to Mineralize Algae Organic Matter, (In Russian),
W74-02252 5B

BANKS
Coleman V. Forister (Suit to Establish Right of Use of Land for Ingress and Egress to Creek Waterfront).
W74-02517 6E

BARLEY
The Action of Abscisic Acid on Ion Uptake and Water Flow in Plant Roots,
W74-02260 3F

BAYES THEOREM
A Bayesian Decision Framework for Synthetic Hydrology,
W74-02438 6A

BEACH EROSION
A Study on the Erosion of Niigata Beach from ERTS-A Imagery,
W74-02584 7B

Sedimentation and Scour Off Nuclear Power Plants,
W74-02645 2J

Detailed Analysis of Short-Term Variations in Beach Morphology (And Concurrent Dynamic Processes) for Summer and Winter Periods, 1971-1972, Plum Island, Massachusetts,
W74-02649 2E

BEACHES
Two-Dimensional Waves Generated by a Surface Pressure Disturbance Over a Sloping Beach,
W74-02187 2E

Fate of Petroleum Hydrocarbons In Beach Sand,
W74-02473 5B

Easements: Judicial and Legislative Protection of the Public's Rights in Florida's Beaches,
W74-02508 6E

Public Access to Beaches: Common Law Doctrines and Constitutional Challenges.
W74-02512 6E

Wave Breaking in Shallow Water,
W74-02638 2L

An Annotated Bibliography of Aerial Remote Sensing in Coastal Engineering,
W74-02646 2L

BEAR GLACIER
Bear Glacier Has Come Alive (Lednik Medvezhiy ozhil),
W74-02614 2C

BENEFITS
The Ex Post Measurement of Benefits and Costs in Small Watershed Projects,
W74-02212 6B

BENTHAL OXYGEN DEMAND
A Study of the Factors Determining the Oxygen Uptake of Benthal Stream Deposits,
W74-02451 5C

BENTHIC FAUNA
The Distribution of Trace Metals and Fauna in the Firth of Clyde in Relation to the Disposal of Sewage Sludge,
W74-02420 5B

A Study of the Factors Determining the Oxygen Uptake of Benthal Stream Deposits,
W74-02451 5C

BENTHOS
An Ecological Evaluation of Stream Eutrophication,
W74-02201 5C

A Study of the Factors Determining the Oxygen Uptake of Benthal Stream Deposits,
W74-02451 5C

BENZENOIDS
Chemistry of Marine Natural Products,
W74-02189 5B

BERYLLIUM
Analytical Applications of Gas Chromatography of Metal Chelates,
W74-02366 2K

BETA-VULGARIS-F-RUBRA
Study of the Intracellular Water State in Plants Under the Effect of Phenols, (In Russian),
W74-02234 2I

BIBLIOGRAPHIES
Selected References, Ground-Water Contamination, The United States of America and Puerto Rico.
W74-02482 5B

Evapotranspiration and Watershed Research as Related to Riparian and Phreatophyte Management--An Abstract Bibliography.
W74-02630 2D

Research Pertinent to Environmental Quality Concerning the Period, 1967-1971.

BIG SIOUX RIVER VALLEY (S DAK)
Water Resources of the Big Sioux River Valley Near Sioux Falls, South Dakota,
W74-02619 2E

BIGHORNS (WYO-MONT)
Structural Interpretations Based on ERTS-1 Imagery, Bighorn Region, Wyoming-Montana,
W74-02568 7B

BIOACCUMULATION
Toxaphene Accumulation in Fish in Lakes Treated for Rough Fish Control,
W74-02425 5C

BIOASSAY
Measuring Stress in Fish Exposed to Pulp Mill Effluents,
W74-02276 5C

BIOCHEMICAL OXYGEN DEMAND
Quick-Time Instrumental Measurements of Wastewater Organic Characteristics,
W74-02170 5A

Mathematical Relationships of BOD Removal in Activated Sludge Process,
W74-02176 5D

Reduction of BOD and Phosphate by Chemical Precipitation. Utilisation of Sludge,
W74-02267 5D

A Study of the Factors Determining the Oxygen Uptake of Benthal Stream Deposits,
W74-02451 5C

Nitrification of BOD-Containing Water,
W74-02485 5D

BIOCLIMATES
Agroclimatic Areas for Wheat and Bioclimatic Characteristics of its Cultivars in Uruguay, (In Spanish),
W74-02354 3F

BIODEGRADATION
Problems with Colored Papers: Are They a Cause of Pollution, (Probleme mit farbigen Papieren: Sind sie eine Ursache von Verschmutzung),
W74-02255 5B

Current Status of the Environmental and Human Safety Aspects of Nitrilotriacetic Acid (NTA),
W74-02394 5B

Hydrocarbon-Oxidizing Bacteria and Their Possible Use as Controlling Agents of Oil Pollution in the Ocean,
W74-02618 5G

BIOINDICATORS
Microbial ND Chemical Studies in a Watershed used for Municipal Supply and Waste Disposal,
W74-02449 5C

Seasonal and Areal Distribution and Abundance of the Copepoda in a Mississippi Estuarine System,
W74-02637 2L

BIOLOGICAL SAMPLES
Determination of Zinc by Flameless Atomic Absorption Spectrophotometry,
W74-02399 5A

BIOLOGICAL TREATMENT
Nitrification of BOD-Containing Water,
W74-02485 5D

BIOMASS (PLANKTON)
Attempt at Mollusk Control by Increasing the Planktonic Biomass and by Molluscicidal Treatment: The Urea-N-Tritylmorpholine Association (In French),
W74-02226 5C

BITTERROOT RIVER (MONT)
Floodplain Mapping and Planning for the 50 and 100-Year Interval Flood Zones of the Bitterroot Valley, Montana,
W74-02215 4A

BLACK SEA REGION
Storm Rainfall in the Black Sea Region as a Factor in Soil Erosion,
W74-02607 2B

BLEACHING WASTES
Color Removal from Kraft Pulp Mill Effluents by Massive Lime Treatment,
W74-02284 5D

Hyperfiltration (Reverse Osmosis) of Kraft Pulp Mill and Bleach Plant Wastes,
W74-02285 5D

BLUE CRAB
Iron, Zinc, Magnesium, and Copper Concentrations in Body Meat of the Blue Crab, Callinectes sapidus,
W74-02409 5A

BLUEGULLS
Growth Rates of Lepomis macrochirus (Centrarchidae) in Three Areas of Lake Texoma,
W74-02422 2H

BOILER FEED WATER
Use of Fibrous Materials for Removal of Iron and Iron Compounds From Thermoelectric Power Plant Water and Condensates, (Izpolzuvane na vlaknest material za ulavyane na zhelezo i zhelezni suedineniya ot vodite i kondenzatite na tets),
W74-02251 5D

BOISE VALLEY (IDAHO)
Effect of Irrigation, Fertilization, and Other Cultural Practices on Water Quality,
W74-02321 5C

BOLINAS LAGOON (CALIF.)
Bolinas Lagoon, Marin County, California, Summary of Sedimentation and Hydrology, 1967-69,
W74-02296 2L

BOMBINA-BOMBINA
Age Structure of Populations of Some Amphibia on Banks of Water Reservoirs (In Czech),
W74-02650 2H

BORIC ACID
Extraction of Boric Acid with Aliphatic 1,3-Diols and Other Chelating Agents,
W74-02368 5A

BOTTOM DEPOSITS
Microflora and Chemical Composition of the Bottom Deposits of the Kairak-Kum Reservoir, (In Russian),
W74-02253 5B

BOTTOM FAUNA
Quantitative Estimation of Bottom Fauna in Lake Mariut,
W74-02549 2H

BOTTOM SEDIMENTS
The Quantity and Dimensions of Microorganisms in Bottom Sediments of Fish-Breeding Ponds (In Russian),
W74-02228 8I

Complex Behaviour of Cobalt in the Danube River,
W74-02373 5B

BOTTOM WATER SAMPLER
An Improved Bottom-Water Sampler,
W74-02410 7B

BOUNDARY DISPUTE
Coleman V. Forister (Suit to Establish Right of Use of Land for Ingress and Egress to Creek Waterfront).
W74-02517 6E

BOUNDARY DISPUTES
Scientific Aspects of Maritime Sovereignty Claims,
W74-02498 6E

BOUNDARY PROCESSES
Flow in Open Channels With Smooth Curved Boundaries,
W74-02312 8B

BRAZOS RIVER BASIN (TEX)
Annual Compilation and Analysis of Hydrologic Data for Green Creek, Brazos River Basin, Texas, 1971,
W74-02626 4D

BREAKERS
Wave Breaking in Shallow Water,
W74-02638 2L

BREWERIES
Occurrence of Saprochaete saccharophyla Coker Et Shanor in Fungoid Growth below the Discharge of Breweries, (In Czech),
W74-02242 5B

BRIDGE CONSTRUCTION
Effects of Highway Bridge Construction on a Subarctic Stream,
W74-02295 4C

BRIDGES
Hydrologic Evaluations in Bridge Pier Scour Design,
W74-02309 8B

BRUSH CONTROL
Guide to Improvement of Arizona Rangeland.

CANAL LININGS
Studies on Seepage from Canals with Partial Lining,
W74-02319 4A

CANAL SEEPAGE
Studies on Seepage from Canals with Partial Lining,
W74-02319 4A

CAPACITOR PAPER
Manufacture of Capacitor Paper -- Some Problems with Fresh Water Preparation, (Erzeugung von Kondensatorpapier -- einige Probleme bei der Frischwasserherstellung),
W74-02247 5D

CARBON
In Situ Treatment Methods for Hazardous Material Spills,
W74-02179 5D

Experimental Studies on Phytoplankton Succession in Cayuga Lake,
W74-02217 5C

Seasonal Changes in the Organic Forms of Carbon, Nitrogen and Phosphorus in Sea Water at El in the English Channel During 1968,
W74-02369 5B

CARBON DIOXIDE
Accumulation of Fossil CO2 in the Atmosphere and the Sea,
W74-02375 5C

The Influence of Organic Decomposition on Carbon Dioxide Hydrogen Sulfide, Dissolved Oxygen, and Algae Growth in the Dworshak Reservoir,
W74-02444 5C

CARBONDALE (ILLINOIS)
Fourth Annual Report, City of Carbondale, Illinois, Water and Wastewater Treatment.
W74-02328 5D

CARIES (HUMAN)
Cleanliness of Wells, Chemical Substances in Drinking Water and Their Relation to Caries (In Polish),
W74-02544 5C

CARP
Accumulation of Strontium and Calcium in Freshwater Fishes of Japan,
W74-02197 5C

CARPATHIANS
Storm Rainfall in the Carpathians in June 1969,
W74-02606 2B

CATIONS
Ion-Exchange Separations on Mixed Columns,
W74-02398 5A

CATTLE
Soil Pollution from Cattle Feedlots in Georgia,
W74-02210 5B

The Effects on Runoff, Groundwater, and Land of Irrigating With Cattle Manure Slurries,
W74-02326 5D

Gas-Liquid Chromatographic Determination of Chlorfenvinphos in Milk, Eggs, and Body Tissues of Cattle and Chickens,
W74-02384 5A

CAYUGA LAKE (N.Y.)
An Investigation of the Physical Effects of Thermal Discharges into Cayuga Lake,
W74-02178 5B

CAYUGA LAKE (NEW YORK)
Computer Simulation of Trophic Level Interrelationships in Cayuga Lake,
W74-02216 5C

Experimental Studies on Phytoplankton Succession in Cayuga Lake,
W74-02217 5C

CEMENT
Effect of A Cement Anticorrosion Coating on the Quality of Drinking Water, (In Russian),
W74-02233 5B

CESIUM-137
Some Characteristics of Cesium-137 Accumulation in Populations of Freshwater Fish, (In Russian),
W74-02196 5C

Distribution of Caesium-137 in British Coastal Waters,
W74-02365 5B

CHANNEL EROSION
Hydrologic Evaluations in Bridge Pier Scour Design,
W74-02309 8B

Bed Scour at End-Dump Channel Constrictions,
W74-02316 8B

CHARCOAL-CHLOROFORM EXTRACTION
Using the Adsorption Method on Activated Charcoal with Chloroform Extraction (CCE) for Evaluating Water Pollution by Organic Substances, (In Russian),
W74-02232 5B

CHELATING AGENTS
Extraction of Boric Acid with Aliphatic 1,3-Diols and Other Chelating Agents,
W74-02368 5A

CHELATION
Analytical Applications of Gas Chromatography of Metal Chelates,
W74-02366 2K

CHEMICAL ANALYSIS
Pyridine Ketoximes as Analytical Reagents: The Spectrophotometric Determination of Cobalt with 2-Pyridyl-2-Thienyl-Beta-Ketoxime,
W74-02364 5A

Analyzing Heavy Ends of Crude,
W74-02378 5A

Picloram Photolytic Decomposition,
W74-02383 5B

Analysis of High-Purity Water by Flameless Atomic-Absorption Spectroscopy. Part II. Signal Integration with a Non-Resonance Line Correction System for Spurious Absorption Phenomena,
W74-02385 5A

The Determination of Pentachlorophenol and Hexachlorophene in Human Adipose Tissue,
W74-02391 5A

Polychlorinated Terphenyls in Paperboard Samples,
W74-02392 5A

Microdetermination of Arsenic (III) and Osmium (VIII) through Osmium-Thiourea Reaction,
W74-02396 5A

A High-Speed Liquid Chromatograph with a Flow-Spectrofluorimetric Detector and the Ultramicro-Determination of Aromatic Compounds,
W74-02397 5A

Determination of Zinc by Flameless Atomic Absorption Spectrophotometry,
W74-02399 5A

Atomic Absorption and Fluorescence Spectrometry with a Carbon Filament Atom Reservoir. Part XIV. The Determination of Vanadium in Fuel Oils,
W74-02400 5A

Analysis by Means of Gas Bubble Electrification,
W74-02406 2K

Hanging Mercury Drop Electrodeposition Technique for Carbon Filament Flameless Atomic Absorption Analysis. Application to the Determination of Copper in Sea Water,
W74-02411 2K

Experimental Study of the Phase-Selective Anodic Stripping Analysis of Micromolar Cadmium (II) at the Micrometer Hanging Mercury Drop Electrode in 0.1 m Potassium Chloride,
W74-02415 2K

Separation and Gas-Chromatographic Determination of Traces of Fluoride, (Abtrennung und gas-chromatographische Bestimmung von Fluoridspuren),
W74-02431 5A

Anionic Exchange Separations of the Elements that can be Extracted with Tributyl Phosphate. II, (Anionenaustauschtrennungen der mit Tributylphosphat extrahierbaren Elemente. II),
W74-02432 2K

Application of Activated Carbon for the Enrichment of Trace Elements and Their Determination by Atomic Absorption Spectrometry, (Uber die Verwendung von Aktivkohle zur Anreicherung von Spurenelementen mit nachfolgender Bestim mung durch Atomabsorptions-Spektrometrie,
W74-02433 5A

A Comparison of the Content of Microelements in the Water of the River Danube Near Vienna and Belgrade for 1961-1970 (Ein Vergleich des Gehaltes an Spurenelementen im Donauwasser bei Wien und Beograd fue 1961-1970),
W74-02436 5A

Basic Water-Quality Data for Pollution Abatement Plan, Tampa Bay Area, Florida,
W74-02629 5B

CHEMICAL COMPOSITION
The Chemical Composition and Flow of the South Winterbourne in Dorset,
W74-02190 2K

Microflora and Chemical Composition of the Bottom Deposits of the Kairak-Kum Reservoir, (In Russian),
W74-02253 5B

CHEMICAL FIBER WASTES
Effect of Supernatant Fluid of the Ankistro-Desmus braunii Brunnth Culture on Development of Algae in Waste Waters of the Chernigov Chemical Fiber Industrial Group, (In Ukrainian),
W74-02245 5C

CHEMICAL INDICATORS
Selection of Experimental Conditions for the Photometric Complex Formation Titrations of Metals in the PPM-Range,
W74-02404 5A

CHEMICAL LOSS
Adsorption Characteristics of Silber, Lead, Cadmium, Zinc, and Nickel on Borosilicate

Glass, Polyethylene, and Polypropylene Container Surfaces,
W74-02412 5A

CHEMICAL PRECIPITATION
Reduction of BOD and Phosphate by Chemical Precipitation. Utilisation of Sludge,
W74-02267 5D

CHEMICAL PROPERTIES
The Formation of Water-In-Oil Emulsions Subsequent to an Oil Spill,
W74-02377 5B

CHEMICAL REACTIONS
Microdetermination of Arsenic (III) and Osmium (VIII) through Osmium-Thiourea Reaction,
W74-02396 5A

CHEMICAL RECOVERY
Sodium Recovery from a Pulp Mill Waste Effluent by Ion Exchange,
W74-02259 5D

Extraction of Boric Acid with Aliphatic 1,3-Diols and Other Chelating Agents,
W74-02368 5A

CHEMICAL STRUCTURE
Chemistry of Marine Natural Products,
W74-02189 5B

CHEMICAL WASTES
U.S. V. American Cyanamid Company (Action for Discharge into Navigable Waterways).
W74-02522 6E

CHEMISTRY
Chemistry of Marine Natural Products,
W74-02189 5B

CHERNOZEMS
Moisture Regime of Southern Chernozem Within Shelterbelts, (Rezhim vlazhnosti yuzhnogo chernozema v sisteme lesnykh polos),
W74-02302 2G

CHIRCHIK RIVER
Chemical Characteristics of Surface Waters in the Upper Chirchik River Basin (Khimicheskaya kharakteristika poverkhnostnykh vod verkhney chasti basseyna r. Chirchik),
W74-02612 2K

CHLORELLA
The Effects of Acid Mine Water on Growth (Number and Size) of Chlorelia vulgaris,
W74-02168 5C

The Growth of Chlorella vulgaris in Sewage and Acid Mine Water,
W74-02169 5C

CHLORIDES
Significance of pH and Chloride Concentration on Behavior of Heavy Metal Pollutants: Mercury (II), Cadmium (II), Zinc (II), and Lead (II),
W74-02155 5B

Analytical Applications of Gas Chromatography of Metal Chelates,
W74-02366 2K

CHLORINATED HYDROCARBON PESTICIDES
Gas-Liquid Chromatographic Determination of Chlorfenvinphos in Milk, Eggs, and Body Tissues of Cattle and Chickens,
W74-02384 5A

Voltammetric Identification of Organochlorine Insecticides, Polychlorinated Biphenyls, Polychlorinated Naphthalenes and Polychlorinated Benzenes,
W74-02389 5A

Enhancement of the Sensitivity and Selectivity of the Coulson Electrolytic Conductivity Detector to Chlorinated Hydrocarbon Pesticides,
W74-02413 5A

CHLORINATED HYDROCARBONS
Chlorination Effects on Organic Constituents in Effluents from Domestic Sanitary Sewage Treatment Plants,
W74-02416 5C

CHLORINATION
The Removal of Organic Compounds in the Production of Potable Water,
W74-02265 5F

Chlorination Effects on Organic Constituents in Effluents from Domestic Sanitary Sewage Treatment Plants,
W74-02416 5C

Sewage Treatment Apparatus,
W74-02489 5D

Public Water Supplies--Chlorination.
W74-02538 5G

CHLORODIOXINS
Chlorodioxins in Pesticides, Soils, and Plants,
W74-02371 5B

CHLOROPHYTA
Effect of Heated Water from Konakov Hydro-Electric Station on Oxygen Content and Development of Phytoplankton in Ivan'Kovskoe Reservoir During Winter, (In Russian),
W74-02244 5B

CHLORPHYTA
The Effects of Acid Mine Water on Growth (Number and Size) of Chlorelia vulgaris,
W74-02168 5C

The Growth of Chlorella vulgaris in Sewage and Acid Mine Water,
W74-02169 5C

CHROMATOGRAPHIC SAMPLING VALVES
High Precision Sampling for Chromatographic Separations,
W74-02414 2K

CHROMATOGRAPHY
High Precision Sampling for Chromatographic Separations,
W74-02414 2K

Potentiality of the Coupling of Column Liquid Chromatography and Field Desorption Mass Spectrometry,
W74-02430 2K

CHROMIUM
Determination of Trace Amounts of Chromium by Atomic Absorption Spectrometry with a Tantalum Filament Atomizer,
W74-02367 2K

Applications, Involving the Iodide Ion. VIII. Direct and Indirect Determination of Mercury (I) and Analysis of Mixtures. Analysis of Chromium (VI)-Chromium (III) Mixtures. Determination of Hypochlorite,
W74-02395 5A

CHROMOGENIC REAGENTS
Pyridine Ketoximes as Analytical Reagents: The Spectrophotometric Determination of Cobalt with 2-Pyridyl-2-Thienyl-Beta-Ketoxime,
W74-02364 5A

CHRYSOPHYCEAE
On Mallomonas lelymeme Harris Et Bradley (Chrysophyceae), (In Japanese),
W74-02550 2H

CICHLIDAE
Comparative Biology of Tilapia rendalli (Boulenger) (Pisces cichlidae) in Lake Itasy and Lake Mantasoa, (In French),
W74-02344 2H

CILIATED PROTOZOA
Ciliated Protozoa. An Illustrated Guide to the Species Used as Biological Indicators in Freshwater Biology,
W74-02236 2I

CINDER SETTLING TANKS
Effect of a Cinder Settling Tank of a Thermal Electric Power Plant on the Quality of Subsurface Waters, (In Russian),
W74-02231 5B

CITY PLANNING
City of Austin, Texas, Study of Wastewater Collection System: Phase I.
W74-02330 5D

CLADOCERA
Some Further Results of the Zooplankton Studies in the Czechslovak-Hungarian Stretch of the Danube,
W74-02545 2I

CLEAR AIR TURBULENCE
Application of ERTS Data to the Detection of Thin Cirrus and Clear Air Turbulence,
W74-02585 7B

CLEARWATER (FLA)
Hydrogeologic Aspects of a Proposed Sanitary Landfill Near Old Tampa Bay, Florida,
W74-02628 5E

CLIMATIC DATA
Psychrometric Data Patterns and Prediction Models,
W74-02220 2B

Application and Consequences of Precipitation Observations in the Republic of Sudan in View of the Nomadic Life and Economy,
W74-02348 2B

Water Recycling of Sewage Effluent by Irrigation: A Field Study on Oahu,
W74-02631 2B

CLOGGING
Determination of the Mechanical Compatibility of Porous Rocks with Waste Water in its Subsurface Disposal,
W74-02165 5B

CLOSTERIUM-SPP
On the Relation Between the Occurrence of Desmids and the Salinity in the Hokuriku District of Japan, (In Japanese).
W74-02191 5B

CLOUD SEEDING
Weather Modification Operations In California, October 1, 1970-September 30, 1971,
W74-02293 3B

CLOUDS
Application of ERTS Data to the Detection of Thin Cirrus and Clear Air Turbulence,
W74-02585 7B

COAGULATION
The Removal of Organic Compounds in the Production of Potable Water,
W74-02265 5F

Reduction of BOD and Phosphate by Chemical Precipitation. Utilisation of Sludge,
W74-02267 5D

COAL GASIFICATION
'Clean Energy Via Coal Gasification',
W74-02462 6B

COALS
'Clean Energy Via Coal Gasification',
W74-02462 6B

COASTAL ENGINEERING
Approaches to State Coastal Management,
W74-02185 2L

An Annotated Bibliography of Aerial Remote Sensing in Coastal Engineering,
W74-02646 2L

Bulletin and Summary of Research Progress Fiscal Years 1970-71.
W74-02647 2L

COASTAL PLAINS
A Self-Draining Subsurface Rainfall Conservation System: Its Effect on the Soil Water Status and Productivity of Coastal Plains Sands,
W74-02193 2G

Guidelines for the Coastal Zone.
W74-02510 2L

Lineaments in Coastal Plain Sediments as Seen in ERTS Imagery,
W74-02566 7B

COASTS
Two-Dimensional Waves Generated by a Surface Pressure Disturbance Over a Sloping Beach,
W74-02187 2E

Research in the Coastal and Oceanic Environment,
W74-02481 2L

Easements: Judicial and Legislative Protection of the Public's Rights in Florida's Beaches,
W74-02508 6E

Public Access to Beaches: Common Law Doctrines and Constitutional Challenges.
W74-02512 6E

Use of ERTS-1 in Coastal Studies,
W74-02633 2L

Wave Breaking in Shallow Water,
W74-02638 2L

An Annotated Bibliography of Aerial Remote Sensing in Coastal Engineering,
W74-02646 2L

Bulletin and Summary of Research Progress Fiscal Years 1970-71.
W74-02647 2L

Research Pertinent to Environmental Quality Concerning the Period, 1967-1971.
W74-02648 2L

COBALT
Pyridine Ketoximes as Analytical Reagents: The Spectrophotometric Determination of Cobalt with 2-Pyridyl-2-Thienyl-Beta-Ketoxime,
W74-02364 5A

Complex Behaviour of Cobalt in the Danube River,
W74-02373 5B

COBALT-60
Calculation of Dose Conversion Factors for 60Co Gamma Radiation in Water, (In German),
W74-02198 5B

COHO SALMON
Puget Sound Resident Coho Salmon Study,
W74-02639 2L

COLLIER COUNTY (FLA)
Summary of Hydrologic Conditions in Collier County, Florida, 1972,
W74-02622 2A

COLOR
Color Removal from Kraft Pulp Mill Effluents by Massive Lime Treatment,
W74-02284 5D

COLORADO
Hydrologic Simulation Model of Colorado Subalpine Forest,
W74-02248 7B

Predicting Avalanche Intensity from Weather Data: A Statistical Analysis,
W74-02294 2C

COLORED PAPER
Problems with Colored Papers: Are They a Cause of Pollution, (Probleme mit farbigen Papieren: Sind sie eine Ursache von Verschmutzung),
W74-02255 5B

COLORIMETRY
Printout Colorimeter for Autoanalysis of Water Pollution,
W74-02374 5A

COMBINED SEWERS
Water Quality Characteristics of Storm Sewer Discharges and Combined Sewer Overflows,
W74-02345 5B

COMBINED TREATMENT
Hylte Bruk: Newsprint and Environmental Protection, (Hylte Bruk: Zeitungsdruckpapier and Umweltschultz).
W74-02256 5D

COMPLEXATION
Extraction and Spectrophotometric Determination of Vanadium as a Mixed Ligand Complex of Oxine and Azide,
W74-02362 5A

COMPREHENSIVE PLANNING
City of Austin, Texas, Study of Wastewater Collection System: Phase I.
W74-02330 5D

General Soils Study: Pearl River, Hancock, Harrison Counties, Mississippi.
W74-02333 2G

A Water and Sewer Plan: Greene County, Georgia.
W74-02334 5D

A Water and Sewer Plan: Morgan County, Georgia.
W74-02335 5D

A Water and Sewer Plan: Madison County, Georgia.
W74-02336 5D

A Water and Sewer Plan: Walton County, Georgia.
W74-02337 5D

Regional Wastewater Facilities Study.
W74-02338 5D

Northeast Georgia Area Water and Sewer Systems Plan and Capital Improvement Program.
W74-02339 3D

COMPUTER MODELS
Measuring Snowfall, A Critical Factor for Snow Resource Management,
W74-02184 2C

Computer Simulation of Trophic Level Interrelationships in Cayuga Lake,
W74-02216 5C

Hydrologic Simulation Model of Colorado Subalpine Forest,
W74-02248 7B

A Conjunctive use Surface Water-Ground Water Simulator,
W74-02452 2F

COMPUTER PROGRAMS
System 21, 'Jupiter' (A Design System for Two-Dimensional Nearly-Horizontal Flows),
W74-02159 7C

Optimization of Industrial Systems with the Separable Programming and the Generalized Reduced Gradient Methods,
W74-02213 5G

Municipal Water Planning--Mixed Integer Approach,
W74-02223 3D

Hydrologic and Watershed Modeling for Watershed Planning,
W74-02224 4D

Computer Simulation of Storm Water Runoff,
W74-02310 2E

Interpretation of Infrared Specta Using Pattern Recognition Techniques,
W74-02376 2K

Hymo: Problem-Oriented Computer Language for Hydrologic Modeling--Users Manual,
W74-02469 2A

COMPUTER SIMULATION
A Conjunctive use Surface Water-Ground Water Simulator,
W74-02452 2F

CONDEMNATION
Canyon Public Service District V. Tasa Coal Company (Eminent Domain Proceeding Held Public Service District had Right to Condemn Defendant's Lands for Use in Connection with Sewer Facilities, Defendant Appeals) .
W74-02531 6E

CONDENSER PAPER
Manufacture of Capacitor Paper – Some Problems with Fresh Water Preparation, (Er-

zeugung von Kondensatorpapier -- einige Probleme bei der Frischwasserherstellung),
W74-02247 5D

CONDENSERS
Internally Interconnected Multi-Stage Distillation System,
W74-02496 3A

CONFERENCES
(TAPPI) Environmental Conference, May 14-16, 1973.
W74-02273 5D

State Water Plan, Proceedings of 18th Annual New Mexico Water Conference.
W74-02456 6B

CONJUNCTIVE USE
Water Resources Development in the Mullica River Basin,
W74-02450 5C

A Conjunctive use Surface Water-Ground Water Simulator,
W74-02452 2F

CONSERVATION
Hydrologic and Watershed Modeling for Watershed Planning,
W74-02224 4D

CONSOLIDATION
Legal and Institutional Constraints in Consolidating Irrigation Systems,
W74-02533 3F

CONSTRUCTION COSTS
Water and Sewerage Improvements Needed in 1975 in Chatham County, Georgia.
W74-02186 5D

CONTINENTAL MARGINS
Indices of National Interest in the Oceans,
W74-02499 6E

CONTINENTAL SHELF
Scientific Aspects of Maritime Sovereignty Claims,
W74-02498 6E

Indices of National Interest in the Oceans,
W74-02499 6E

Development of the Freedom of Scientific Research Issue of the Third Law of the Sea Conference,
W74-02501 6E

Submerged Lands.
W74-02540 6E

COPEPODA
Some Further Results of the Zooplankton Studies in the Czechslovak-Hungarian Stretch of the Danube,
W74-02545 2I

COPEPODS
Seasonal and Areal Distribution and Abundance of the Copepoda in a Mississippi Estuarine System,
W74-02637 2L

COPPER
Iron, Zinc, Magnesium, and Copper Concentrations in Body Meat of the Blue Crab, Callinectes sapidus,
W74-02409 5A

Hanging Mercury Drop Electrodeposition Technique for Carbon Filament Flameless Atomic Absorption Analysis. Application to the Determination of Copper in Sea Water,
W74-02411 2K

A Mass Balance Model of Trace Metals in Several Delaware Watersheds,
W74-02443 5B

CORN (FIELD)
Dry Activated Sludge as Fertilizer for Winter Wheat and Corn, (Sukhoi aktivnyi il kak udobrenie dlya posevov ozimi pshenits' i kukuruz'),
W74-02270 5D

CORNING (N.Y.)
Flood of June 1972 at Corning, New York,
W74-02479 7C

CORROSION CONTROL
Effect of A Cement Anticorrosion Coating on the Quality of Drinking Water, (In Russian),
W74-02233 5B

COST ANALYSIS
Economic Evaluation of the Sport Fishery of the Au Sable River, Michigan,
W74-02203 6B

Economic Aspects of Environmental Protection (In German),
W74-02227 5G

Ion Exchange and Allied Processes in Water Recovery,
W74-02268 5D

The Impact of Water Pollution Abatement on Competition and Pricing in the Alabama Steel Industry,
W74-02437 5D

COST-BENEFITS ANALYSIS
The Ex Post Measurement of Benefits and Costs in Small Watershed Projects,
W74-02212 6B

COST-EFFECTIVENESS
Cost Effectiveness of Current Environmental Engineering Practices,
W74-02225 5D

COST MINIMIZATION
Municipal Water Planning--Mixed Integer Approach,
W74-02223 3D

COST SHARING
The Problems and Issues of Implementing the Federal Water Project Recreation Act in the Pacific Northwest,
W74-02453 6C

COSTS
Flood Control Funds -- 1970 Report to the Legislature.
W74-02292 6C

COTTON
Grasshoppers and Crickets in the Karshi Steppe, (In Russian),
W74-02239 3F

Trickle Irrigation on Cotton,
W74-02347 3F

CRABS
Iron, Zinc, Magnesium, and Copper Concentrations in Body Meat of the Blue Crab, Callinectes sapidus,
W74-02409 5A

CRETACEOUS PERIOD
A Hydrogeothermal Description of Groundwater in Upper Cretaceous Deposits in the Southeast Aral Sea Area (Gidrogeotermicheskaya kharakteristika podzemnykh vod verkhnego mela Yugo-Vostochnogo Priaral'ya),
W74-02609 2F

CRICKETS
Grasshoppers and Crickets in the Karshi Steppe, (In Russian),
W74-02239 3F

CROP PRODUCTION
A Way to Make the Desert Green,
W74-02346 3B

CROP RESPONSE
Trickle Irrigation on Cotton,
W74-02347 3F

CRUDE OIL
The Formation of Water-In-Oil Emulsions Subsequent to an Oil Spill,
W74-02377 5B

Analyzing Heavy Ends of Crude,
W74-02378 5A

CRUSTACEANS
Description, Distribution, and Ecology of the Rotifer and Crustacean Plankton Communities, Flathead Lake, Montana,
W74-02448 2H

Seasonal and Areal Distribution and Abundance of the Copepoda in a Mississippi Estuarine System,
W74-02637 2L

CRYPTOCHIRONOMUS
Contribution to the Study of Zooplankton and Zoobenthos in the Mingechaur Reservoir, (In Russian),
W74-02341 2H

CRYSTALS
Experience in a Quantitative Assessment of Organization of Snow Cover as a Natural System (Opyt kolichestvennoy otsenki organizatsii snezhnogo pokrova kak prirodnoy sistemy),
W74-02613 2C

CURRENTS (WATER)
System 21, 'Jupiter' (A Design System for Two-Dimensional Nearly-Horizontal Flows),
W74-02159 7C

CYANOPHYTA
Effect of Heated Water from Konakov Hydro-Electric Station on Oxygen Content and Development of Phytoplankton in Ivan'Kovskoe Reservoir During Winter, (In Russian),
W74-02244 5B

CYNOSCION ARENARIUS
Development of a Mathematical Model to Predict the Occurrence of Cynoscion arenarius in Mississippi Estuaries,
W74-02640 2L

CYPRINID FISH
Considerations Concerning the Biology and Distribution Area of the Cyprinid Fish Pseudorasbora parva (Schlegel) in the Romanian Waters,
W74-02553 2I

CZECHOSLAVAKIA (BOHEMIA)
Occurrence of Saprochaete saccharophyla Coker Et Shanor in Fungoid Growth below the Discharge of Breweries, (In Czech),
W74-02242 5B

DAM FAILURE
Dam-Break Flood in a Prismatic Dry Channel,
W74-02311 8B

DAMPING (WATER WAVES)
Damping of Water Waves Over Porous Bed,
W74-02315 2E

DAMS
Bed Scour at End-Dump Channel Constrictions,
W74-02316 8B

Environmental Defense Fund, Inc. V. Froehlke (Action Brought for Declaratory Judgment and Injunction Restraining Completion of Reservoir Project).
W74-02524 6E

DANUBE RIVER
Complex Behaviour of Cobalt in the Danube River,
W74-02373 5B

A Comparison of the Content of Microelements in the Water of the River Danube Near Vienna and Belgrade for 1961-1970 (Ein Vergleich des Gehaltes an Spurenelementen im Donauwasser bei Wien und Beograd fue 1961-1970),
W74-02436 5A

Some Further Results of the Zooplankton Studies in the Czechslovak-Hungarian Stretch of the Danube,
W74-02545 2I

Thermal Regime of the Lower Reaches of the Danube River in Autumn and Winter,
W74-02605 2C

DATA COLLECTIONS
Mapping Average Annual Surface Water Resources of the Hydrological Regions of Nelson, New Zealand,
W74-02290 2E

General Soils Study: Pearl River, Hancock, Harrison Counties, Mississippi.
W74-02333 2G

Water Resources of Lee County, Mississippi,
W74-02340 4B

Use of Digital Computer Techniques in Water Resources Data Storage,
W74-02357 4B

Basic Water-Quality Data for Pollution Abatement Plan, Tampa Bay Area, Florida,
W74-02629 5B

DATA PROCESSING
Interpretation of Infrared Specta Using Pattern Recognition Techniques,
W74-02376 2K

Digital Analysis of Potomac River Basin ERTS Imagery: Sedimentation Levels at the Potomac-Anacostia Confluence and Strip Mining in Allegheny County, Maryland,
W74-02583 7B

DATA STORAGE AND RETRIEVAL
Use of Digital Computer Techniques in Water Resources Data Storage,
W74-02357 4B

DECISION MAKING
Input Specifications to Stochastic Decision Models,
W74-02209 2E

DECISION THEORY
A Bayesian Decision Framework for Synthetic Hydrology,
W74-02438 6A

DECOLORIZATION
Stability and Removal of Commercial Dyes from Process Wastewater,
W74-02429 5B

DECOMPOSING
The Influence of Organic Decomposition on Carbon Dioxide Hydrogen Sulfide, Dissolved Oxygen, and Algae Growth in the Dworshak Reservoir,
W74-02444 5C

DEFORMATION
The Role of Deformation in Changing the Reservoir Properties of Aquifers,
W74-02446 2F

Hyperbolic Stress Equations for Compressible Slabs,
W74-02624 2C

DEGRADATION PRODUCTS
Photolysis of Parathion (O,O-Diethyl-O- (4-Nitrophenyl) Thiophosphate). New Products,
W74-02380 5B

Rates and Products of Decomposition of 2,2-Dibromo-3-Nitrilopropionamide,
W74-02382 5B

DEGRADATION RATES
Rates and Products of Decomposition of 2,2-Dibromo-3-Nitrilopropionamide,
W74-02382 5B

DELAWARE
A Mass Balance Model of Trace Metals in Several Delaware Watersheds,
W74-02443 5B

Research in the Coastal and Oceanic Environment,
W74-02481 2L

DELAWARE PIEDMONT
Geologic Control of Ground Water Movement in a Portion of the Delaware Piedmont,
W74-02320 2F

DEMAND
The Demand for and Value of the Sport Fishery on the Au Sable, Jordan, and Red Cedar Rivers,
W74-02204 6B

DENTAL DECAY
Sixteen Years of Water Fluoridation in the Netherlands and Its Influence on Dental Decay,
W74-02229 5F

DESALINATION
Another Rio Grande for New Mexico,
W74-02461 3A

Multi-Stage Flash Evaporator,
W74-02490 3A

Internally Interconnected Multi-Stage Distillation System,
W74-02496 3A

DESALINATION PLANTS
The Use of Desalted Seawater for Intensive Agricultural Applications, (El Uso de Agua de Mar Desalada Para Intensivas Aplicaciones Agricolas),
W74-02359 3A

DESALINATION PROCESSES
Improving Reverse Osmosis Performance with Dynamically Formed Wood Chemical Membranes,
W74-02286 5D

DESERT STRIP FARMING
A Way to Make the Desert Green,
W74-02346 3B

DESERTS
Ecological and Phytosociological Study of a Sector in the Lybian Desert,
W74-02507 2I

DESIGN
Optimum Design Period for Water Pollution Control Plants,
W74-02222 5D

DESMIDS
On the Relation Between the Occurrence of Desmids and the Salinity in the Hokuriku District of Japan, (In Japanese).
W74-02191 5B

DESORPTION
Organic Desorption from Carbon-II. The Effect of Solvent in the Desorption of Phenol from Wet Carbon,
W74-02418 5A

Organic Desorption from Carbon-II. The Effect of Solvent in the Desorption of Phenol from Dry Carbon,
W74-02419 5A

DETERGENTS
Removal of Organic Matter from Water by Resinous Adsorbents,
W74-02266 5D

DICAMBA
Dissipation and Phytotoxicity of Dicamba Residues in Water,
W74-02370 5B

DIFFUSION
The Turbulent Temperature Mixing Layer,
W74-02162 8B

Field Tests on Transverse Mixing in Rivers,
W74-02318 5B

DIRECT DYES
Stability and Removal of Commercial Dyes from Process Wastewater,
W74-02429 5B

DISCHARGE
State of New Jersey, Department of Environmental Protection V. Jersey Central Power and Light Company (Action to Enforce Penalty Provision for Discharge of Harmful Substance into Tidal Waters).
W74-02520 6E

DISCHARGE (WATER)
State of New Jersey, Department of Environmental Protection V. Jersey Central Power and Light Company (Action to Enforce Penalty Provision for Discharge of Harmful Substance into Tidal Waters).
W74-02520 6E

DISINFECTION
Method and Apparatus for Electrolytic Treatment of Sewage,
W74-02486 5D

DISPERSION
The Turbulent Temperature Mixing Layer,
W74-02162 8B

Dispersion in Flow from a Continuous Source at Sea,
W74-02163 5B

Investigation of the Relation Between Moisture Potential and 'Reduced Film Thickness' for Disperse Systems with Nonporous Particles, (Issledovaniye zavisimosti mezhdu potentsialom vlazhnosti i 'privedennoy tolshchincy plenki' dlya di spersnykh sistem s neporistymi chastitsami),
W74-02304 2G

Field Tests on Transverse Mixing in Rivers,
W74-02318 5B

Dispersion of Substances from Well Recharge Operations in an Anisotropic, Homogeneous Confined Aquifer,
W74-02454 2F

DISSOLVED OXYGEN
Salinity Corrections for Dissolved Oxygen Measurements,
W74-02424 5A

The Influence of Organic Decomposition on Carbon Dioxide Hydrogen Sulfide, Dissolved Oxygen, and Algae Growth in the Dworshak Reservoir,
W74-02444 5C

DISTILLATION
Internally Interconnected Multi-Stage Distillation System,
W74-02496 3A

DISTRIBUTION
Probability Analysis in an Approximate Theory of Movement of Water Masses, (Veroyatnostnyy analiz v priblizhennoy teorii peremeshcheniya vodnykh mass),
W74-02305 2E

DISTRIBUTION PATTERNS
Distribution of Caesium-137 in British Coastal Waters,
W74-02365 5B

Quantitative Estimation of Bottom Fauna in Lake Mariut,
W74-02549 2H

DITCHES
Ground Water Seepage Patterns to Wells for Unconfined Flow--Phase II,
W74-02206 2F

DOCUMENTATION
Fourth Annual Report, City of Carbondale, Illinois, Water and Wastewater Treatment.
W74-02328 5D

DOMESTIC WASTES
Chlorination Effects on Organic Constituents in Effluents from Domestic Sanitary Sewage Treatment Plants,
W74-02416 5C

DOSE CONVERSION
Calculation of Dose Conversion Factors for 60Co Gamma Radiation in Water, (In German),
W74-02198 5B

DRAGONFLIES
The Phenology of Dragonflies in the Dehra Dun Valley, India,
W74-02237 2I

DRAINAGE
Levees and Drains--Change of Water-Courses.
W74-02536 6E

DRAINAGE AREA
River Regimes in Iran,
W74-02298 2E

DRAWDOWN
Unsteady Drawdown at a Partially Penetrating Well in a Transversely Isotropic Artesian Aquifer,
W74-02466 4B

DREDGING
Yoffe V. Special Board, Chapter 387, (State Denial of License to Exploit Natural Resources of a Lake Bed).
W74-02514 6E

DROUGHTS
Statistical Analysis of North Carolina Precipitation Data,
W74-02632 2B

DRY CARBON
Organic Desorption from Carbon-II. The Effect of Solvent in the Desorption of Phenol from Dry Carbon,
W74-02419 5A

DTPA
Amperometric Titration of Mercury (II) with EDTA, DTPA and Trien in the PPM-Range,
W74-02405 5A

DUCKS (WILD)
An Evaluation of Space Acquired Data as a Tool for Management of Wildlife Habitat in Alaska,
W74-02596 7B

DWORSHAK RESERVOIR (IDA)
The Influence of Organic Decomposition on Carbon Dioxide Hydrogen Sulfide, Dissolved Oxygen, and Algae Growth in the Dworshak Reservoir,
W74-02444 5C

DYE RELEASES
Problems with Colored Papers: Are They a Cause of Pollution, (Probleme mit farbigen Papieren: Sind sie eine Ursache von Verschmutzung),
W74-02255 5B

DYES
Stability and Removal of Commercial Dyes from Process Wastewater,
W74-02429 5B

DYNAMOMETERS
Analysis of Internal Flow Characteristics of a Smooth-Disk Water-Brake Dynamometer,
W74-02475 8C

EARTHQUAKES
ERTS-1 Image Contributes to Understanding of Geologic Structures Related to Managua Earthquake, 1972,
W74-02561 7B

A New Fault Lineament in Southern California,
W74-02570 7B

EASEMENTS
Coleman V. Forister (Suit to Establish Right of Use of Land for Ingress and Egress to Creek Waterfront).
W74-02517 6E

EAST GALLATIN RIVER (MONT.)
Microbial ND Chemical Studies in a Watershed used for Municipal Supply and Waste Disposal,
W74-02449 5C

EAST GERMANY (MECKLENBURG)
Comparative Productivity Studies of Three Mecklenburg Lakes (Lake Kummerow, Lake Teterow and Lake Malchin), (In German),
W74-02558 2H

ECOLOGICAL DISTRIBUTION
Seasonal and Areal Distribution and Abundance of the Copepoda in a Mississippi Estuarine System,
W74-02637 2L

ECOLOGICAL STUDIES
Ecological and Phytosociological Study of a Sector in the Lybian Desert,
W74-02507 2I

ECONOMIC
Pulp and Paper Mill Sludge Utilization and Disposal,
W74-02278 5D

ECONOMIC EFFICIENCY
Cost Effectiveness of Current Environmental Engineering Practices,
W74-02225 5D

Ion Exchange and Allied Processes in Water Recovery,
W74-02268 5D

ECONOMIC FEASIBILITY
The Ex Post Measurement of Benefits and Costs in Small Watershed Projects,
W74-02212 6B

Purification of Effluents by Means of Reverse Osmosis, (Ochistka stochnykh vod metodom obratnogo osmosa),
W74-02258 5D

Evaluation of the Regional Multipurpose Economic Benefits Resulting From a Water and Related Land Resource Development,
W74-02439 6B

ECONOMIC IMPACT
The Impact of Water Pollution Abatement on Competition and Pricing in the Alabama Steel Industry,
W74-02437 5D

Development of Models for Analyzing Water Resources Development and Use Within a Regional Framework,
W74-02455 6A

ECONOMICS
River Basin Monetary Authorizations--Disaster Relief Act Amendments.
W74-02516 6E

ECOSYSTEMS
Effects of Highway Bridge Construction on a Subarctic Stream,
W74-02295 4C

EDTA
Amperometric Titration of Mercury (II) with EDTA, DTPA and Trien in the PPM-Range,
W74-02405 5A

EFFLUENTS
Characterization of Waste Effluents from a Commercial Pimento Canning Operation,
W74-02379 5A

ELECTRIC POWERPLANTS
Effect of a Cinder Settling Tank of a Thermal Electric Power Plant on the Quality of Subsurface Waters, (In Russian),
W74-02231 5B

ELECTROCHEMISTRY
Hanging Mercury Drop Electrodeposition Technique for Carbon Filament Flameless Atomic Absorption Analysis. Application to the Determination of Copper in Sea Water,
W74-02411 2K

Experimental Study of the Phase-Selective Anodic Stripping Analysis of Micromolar Cadmium (II) at the Micrometer Hanging Mercury Drop Electrode in 0.1 m Potassium Chloride,
W74-02415 2K

ELECTRODES
Nature and Stability of Complex Mercury Compounds in Surface and Ground Waters,
W74-02441 5A

ELECTRODIALYSIS
Ion Exchange and Allied Processes in Water Recovery,
W74-02268 5D

ELECTROLYSIS
Method and Apparatus for Electrolytic Treatment of Sewage,
W74-02486 5D

Process for Removal of Contaminants from Wastes,
W74-02487 5D

ELECTROLYTIC CONDUCTIVITY DETECTOR
Enhancement of the Sensitivity and Selectivity of the Coulson Electrolytic Conductivity Detector to Chlorinated Hydrocarbon Pesticides,
W74-02413 5A

ELECTRON CAPTURE GAS CHROMATOGRAPHY
The Determination of Methyl Mercury in Urine,
W74-02387 5A

ELUTION
Ion-Exchange Separations on Mixed Columns,
W74-02398 5A

EMINENT DOMAIN
Canyon Public Service District V. Tasa Coal Company (Eminent Domain Proceeding Held Public Service District had Right to Condemn Defendant's Lands for Use in Connection with Sewer Facilities, Defendant Appeals) .
W74-02531 6E

EMULSIFICATION
The Formation of Water-In-Oil Emulsions Subsequent to an Oil Spill,
W74-02377 5B

ENDOTHALL
Persistence of Endothall in Aquatic Environment as Determined by Gas-Liquid Chromatography,
W74-02381 5B

ENDRIN
Agricultural Chemicals in Surface Runoff, Ground Water, and Soil: 1. Endrin,
W74-02152 5B

ENERGY CONVERSION
'Clean Energy Via Coal Gasification',
W74-02462 6B

ENGLISH CHANNEL
Seasonal Changes in the Organic Forms of Carbon, Nitrogen and Phosphorus in Sea Water at El in the English Channel During 1968,
W74-02369 5B

ENTROPLICATION
The Influence of Organic Decomposition on Carbon Dioxide Hydrogen Sulfide, Dissolved Oxygen, and Algae Growth in the Dworshak Reservoir,
W74-02444 5C

ENVIRONMENT
A Bill to Prescribe Procedures so as to make Administration of the National Environmental Policy Act of 1969 More Effective.
W74-02528 6E

ENVIRONMENTAL CONTROL
(TAPPI) Environmental Conference, May 14-16, 1973.
W74-02273 5D

Environmental Protection Act of 1973, First Session on S.1104.
W74-02518 6E

ENVIRONMENTAL EFFECTS
Effects of Highway Bridge Construction on a Subarctic Stream,
W74-02295 4C

Water Resources Development in the Mullica River Basin,
W74-02450 5C

Proper Time Limitations on Outer Continental Shelf Leases Under The National Environmental Policy Act,
W74-02509 6E

Barta V. Brinegar (Civil Actions Brought Against Federal and State Officials Seeking to Enjoin Construction of Highway Segment Until Completion of Environmental Impact Study).
W74-02521 6E

Environmental Defense Fund, Inc. V. Froehlke (Action Brought for Declaratory Judgment and Injunction Restraining Completion of Reservoir Project).
W74-02524 6E

A Bill to Prescribe Procedures so as to make Administration of the National Environmental Policy Act of 1969 More Effective.
W74-02528 6E

ERTS-1 Investigation of Ecological Effects of Strip Mining in Eastern Ohio,
W74-02572 7B

Studies of the Sinking Plume Phenomenon,
W74-02644 5C

Research Pertinent to Environmental Quality Concerning the Period, 1967-1971.
W74-02648 2L

ENVIRONMENTAL ENGINEERING
Cost Effectiveness of Current Environmental Engineering Practices,
W74-02225 5D

ENVIRONMENTAL IMPACT STATEMENTS
Ogunquit Sand Dune Land Stabilization Measure, York County in Maine, Threshold to Maine Resource Conservation and Development Project (Final Environmental Statement).
W74-02504 4A

ENVIRONMENTAL PROTECTION
Economic Aspects of Environmental Protection (In German),
W74-02227 5G

Hylte Bruk: Newsprint and Environmental Protection, (Hylte Bruk: Zeitungsdruckpapier and Umweltschultz).
W74-02256 5D

Environmental Protection Act of 1973, First Session on S.1104.
W74-02518 6E

ENZYMATIC TECHNIQUES
Detection and Estimation of Isopropyl Methylphosphonofluoridate and O-Ethyl S Diisopropylaminoethylmethylphosphonothioate in Seawater in Parts-Per-Trillion Level,
W74-02427 5A

EPIDERMAL CELLS
Study on the Plasmolysis Time in Epidermal Cells from Leaves of Saxifraga stolonifera Meerb (In Japanese),
W74-02542 2I

EQUATIONS
On Solving the Unsaturated Flow Equation: The Flux-Concentration Relation,
W74-02464 2G

Hyperbolic Stress Equations for Compressible Slabs,
W74-02624 2A

EROSION
Plant Nutrient Concentrations in Runoff from Fertilized Cultivated Erosion Plots and Prairie in Eastern South Dakota,
W74-02154 2J

A New Oscillating Water Tunnel,
W74-02160 7B

The Relationships Between Land Use and Erosion in the Central North Island, New Zealand
W74-02287 4C

Slope Aspect and Tunnel Erosion in the Lower of Banks Peninsula, New Zealand,
W74-02288 4C

EROSION CONTROL
The Relationships Between Land Use and Erosion in the Central North Island, New Zealand
W74-02287 4C

Prescribed Fire Effects on Water Repellency Infiltration and Retention in Mixed-Conifer Litter, Duff and Soil,
W74-02442 4D

Annual Compilation and Analysis of Hydrologic Data for Little Elm Creek, Trinity River Basin, Texas, 1971,
W74-02477 7C

Annual Compilation and Analysis of Hydrologic Data for Calaveras and Escondido Creeks San Antonio River Basin, Texas, 1971,
W74-02478 7C

Ogunquit Sand Dune Land Stabilization Measure, York County in Maine, Threshold to Maine Resource Conservation and Development Project (Final Environmental Statement)
W74-02504 4A

Soil and Water Conservation Districts.
W74-02537 6E

Annual Compilation and Analysis of Hydrologic Data for Green Creek, Brazos River Basin, Texas, 1971,
W74-02626 4D

ESTIMATED BENEFITS
A Summary Analysis of Nineteen Tests of Proposed Evaluation Procedures on Selected Water and Land Resource Projects.
W74-02188 6B

ESTIMATED COSTS
A Summary Analysis of Nineteen Tests of Proposed Evaluation Procedures on Selected Water and Land Resource Projects.
W74-02188 6B

ESTIMATING
Experience in a Quantitative Assessment of Organization of Snow Cover as a Natural System (Opyt kolichestvennoy otsenki organizatsii snezhnogo pokrova kak prirodnoy sistemy),
W74-02613 2C

ESTUARIES
A Report on Bacterial Pollution Affecting Shellfish Harvesting in Newport River, North Carolina.
W74-02621 5B

Seasonal and Areal Distribution and Abundance of the Copepoda in a Mississippi Estuarine System,
W74-02637 2L

Development of a Mathematical Model to Predict the Occurrence of Cynoscion arenarius in Mississippi Estuaries,
W74-02640 2L

An Annotated Bibliography of Aerial Remote Sensing in Coastal Engineering,
W74-02646 2L

Bulletin and Summary of Research Progress Fiscal Years 1970-71.
W74-02647 2L

EUTROPHICATION
An Ecological Evaluation of Stream Eutrophication,
W74-02201 5C

A Technique for Evaluating Algal Growth Potential in Illinois Surface Waters,
W74-02342 5C

EVALUATION
A Summary Analysis of Nineteen Tests of Proposed Evaluation Procedures on Selected Water and Land Resource Projects.
W74-02188 6B

The Demand for and Value of the Sport Fishery on the Au Sable, Jordan, and Red Cedar Rivers,
W74-02204 6B

The Ex Post Measurement of Benefits and Costs in Small Watershed Projects,
W74-02212 6B

Optimum Design Period for Water Pollution Control Plants,
W74-02222 5D

EVAPORATION
Evaporation from Snowdrifts Under Oasis Conditions,
W74-02183 2D

A Study of Items in the Groundwater Balance of Waterlogged Areas (Ob uzuchenii elementov balansa gruntovykh vod no zabolochennykh uchastkakh),
W74-02610 2D

EVAPORATION CONTROL
Comparison of Raingauge Evaporation Suppressants,
W74-02289 2D

EVAPOTRANSPIRATION
The Water Balance of New Zealand,
W74-02291 2A

Water Regime of Solonchak Solonetzes in Open Areas of Forests in the North Caspian Sea Region, (Vodnyy rezhim solonchakovykh solontsov na polyanakh lesnykh nasazhdeniy Severnogo Prikaspiya),
W74-02301 2G

A Study of Items in the Groundwater Balance of Waterlogged Areas (Ob uzuchenii elementov balansa gruntovykh vod no zabolochennykh uchastkakh),
W74-02610 2D

Evapotranspiration and Watershed Research as Related to Riparian and Phreatophyte Management--An Abstract Bibliography.
W74-02630 2D

EXCESSIVE PRECIPITATION
Severe Floods at New Braunfels, Texas, May 1972,
W74-02173 2E

EXPENDITURES
Flood Control Funds -- 1970 Report to the Legislature.
W74-02292 6C

EXPLOITATION
New Concepts in the Law of the Sea,
W74-02497 6E

EXPLORATION
Geologic Control of Ground Water Movement in a Portion of the Delaware Piedmont,
W74-02320 2F

Evaluation of Commercial Utility of ERTS-A Imagery in Structural Reconnaissance for Minerals and Petroleum,
W74-02567 7B

FARM WASTES
Effect of Feedlot Manure on Soil and Water Quality,
W74-02157 5B

Two Environmental Analyses Involving Agriculture,
W74-02166 5B

Soil Pollution from Cattle Feedlots in Georgia,
W74-02210 5B

The Effects on Runoff, Groundwater, and Land of Irrigating With Cattle Manure Slurries,
W74-02326 5D

FEASIBILITY STUDIES
Feasibility Study of the Sand Sinking Method of Combatting a Major Oil Spill in the Ocean Environment,
W74-02635 5G

FEDERAL
Environmental Defense Fund, Inc. V. Froehlke (Action Brought for Declaratory Judgment and Injunction Restraining Completion of Reservoir Project).
W74-02524 6E

FEDERAL BUDGET
River Basin Monetary Authorizations--Disaster Relief Act Amendments.
W74-02516 6E

FEDERAL-STATE COOPERATION
The Problems and Issues of Implementing the Federal Water Project Recreation Act in the Pacific Northwest,
W74-02453 6C

FEDERAL-STATE WATER RIGHTS CONFLICTS
Legal Developments in Canadian Water Management,
W74-02505 6E

FEED LOTS
Effect of Feedlot Manure on Soil and Water Quality,
W74-02157 5B

Soil Pollution from Cattle Feedlots in Georgia,
W74-02210 5B

FERGANA
Total Isotopic Composition and Hydrochemical Characteristics of Natural Waters in Northwestern and Northern Fergana (Summarnyy izotopnyy sostav i gidrokhimicheskiye osobennosti prirodnykh vod Severo-Zapadnoy i Severnoy Fergany),
W74-02608 2K

FERMENTATION
Bacterial Protein from Paper Mill Sludges,
W74-02282 5E

FERTILIZERS
Plant Nutrient Concentrations in Runoff from Fertilized Cultivated Erosion Plots and Prairie in Eastern South Dakota,
W74-02154 5B

Anhydrous Ammonia for Field Crops: An Evaluation of Anhydrous Ammonia as a Nitrogen Supply for Cotton, Corn, Rice and Wheat,
W74-02240 3F

Dry Activated Sludge as Fertilizer for Winter Wheat and Corn, (Sukhoi aktivnyi il kak udobrenie dlya posevov ozimi pshenits' i kukuruz'),
W74-02270 5D

Effect of Irrigation, Fertilization, and Other Cultural Practices on Water Quality,
W74-02321 5C

FIBROUS BEDS
Use of Fibrous Materials for Removal of Iron and Iron Compounds From Thermoelectric Power Plant Water and Condensates, (Izpolzuvane na vlaknest material za ulavyane na zhelezo i zhelezni suedineniya ot vodite i kondenzatite na tets),
W74-02251 5D

FIELD CROPS
Anhydrous Ammonia for Field Crops: An Evaluation of Anhydrous Ammonia as a Nitrogen Supply for Cotton, Corn, Rice and Wheat,
W74-02240 3F

FILMS
Organic Films on Natural Waters: Their Retrieval, Identification, and Modes of Elimination,
W74-02182 5A

Investigation of the Relation Between Moisture Potential and 'Reduced Film Thickness' for Disperse Systems with Nonporous Particles, (Issledovaniye zavisimosti mezhdu potentsialom vlazhnosti i 'privedennoy tolshchincy plenki' dlya di spersnykh sistem s neporistymi chastitsami),
W74-02304 2G

FILTERS
Use of Fibrous Materials for Removal of Iron and Iron Compounds From Thermoelectric Power Plant Water and Condensates, (Izpolzuvane na vlaknest material za ulavyane na zhelezo i zhelezni suedineniya ot vodite i kondenzatite na tets),
W74-02251 5D

FILTRATION
The Removal of Organic Compounds in the Production of Potable Water,
W74-02265 5F

Water-Treatment-Sludge Filtration Studies,
W74-02440 5D

Method for Removing Suspended Solids from Liquids,
W74-02484 5D

FINANCING
Financing Private Water Resource Development: Analysis of A State Loan Program,
W74-02221 3F

FINITE ELEMENT ANALYSIS
Saturated-Unsaturated Seepage by Finite Elements,
W74-02313 2G

FIRTH OF CLYDE
The Distribution of Trace Metals and Fauna in the Firth of Clyde in Relation to the Disposal of Sewage Sludge,
W74-02420 5B

FISH
Laboratory and Controlled Experimental Stream Studies of the Effects of Kraft Effluents on Growth and Production of Salmonid Fish,
W74-02277 5C

FISH BREEDING PONDS
The Quantity and Dimensions of Microorganisms in Bottom Sediments of Fish-Breeding Ponds (In Russian),
W74-02228 8I

FISH LAKE VALLEY (NEV. AND CALIF.)
Water-Resources Appraisal of Fish Lake Valley, Nevada and California,
W74-02616 2A

FISH MANAGEMENT
The Problems and Issues of Implementing the Federal Water Project Recreation Act in the Pacific Northwest,
W74-02453 6C

Puget Sound Resident Coho Salmon Study,
W74-02639 2L

FISH MIGRATION
The Hydrology of Ten Streams in Western Washington as Related to the Propagation of Several Pacific Salmon Species,
W74-02297 8I

Development of a Mathematical Model to Predict the Occurrence of Cynoscion arenarius in Mississippi Estuaries,
W74-02640 2L

FISH PHYSIOLOGY
Measuring Stress in Fish Exposed to Pulp Mill Effluents,
W74-02276 5C

FISH POPULATIONS
Seasonal Variations in the Qualitative and Quantitative Composition of Young Fish Populations in the Varvara Reservoir, (In Russian),
W74-02560 2H

FISH PROCESSING WASTES
Characterization and Treatment of Fish Processing Plant Effluents in Canada,
W74-02262 5D

FISH TUMORS
Frequency of Fish Tumors Found in a Polluted Watershed as Compared to Nonpolluted Canadian Waters,
W74-02401 5C

FISHERIES
The Prospects of Using the Rybinsk Water Storage Basin for Fisheries, (In Russian),
W74-02241 8I

Development of a Mathematical Model to Predict the Occurrence of Cynoscion arenarius in Mississippi Estuaries,
W74-02640 2L

FISHKILL
State of New Jersey, Department of Environmental Protection V. Jersey Central Power and Light Company (Action to Enforce Penalty Provision for Discharge of Harmful Substance into Tidal Waters).
W74-02520 6E

FLAMELESS ATOMIC ABSORPTION SPECTROPHOTOMETRY
Determination of Zinc by Flameless Atomic Absorption Spectrophotometry,
W74-02399 5A

FLASH DISTILLATION
Multi-Stage Flash Evaporator,
W74-02490 3A

Internally Interconnected Multi-Stage Distillation System,
W74-02496 3A

FLASH FLOODS
Severe Floods at New Braunfels, Texas, May 1972,
W74-02173 2E

FLATHEAD LAKE (MONT)
Description, Distribution, and Ecology of the Rotifer and Crustacean Plankton Communities, Flathead Lake, Montana,
W74-02448 2H

FLOOD CONTROL
Flood Control Funds -- 1970 Report to the Legislature.
W74-02292 6C

A Guide to Important Characteristics and Values of Freshwater Wetlands in the Northeast.
W74-02324 4B

Flood Control Project Maintenance and Repair--1970 Inspection Report,
W74-02617 2E

FLOOD DATA
Flood of June 1972 at Corning, New York,
W74-02479 7C

Floods at Martinsburg and Vicinity, West Virginia,
W74-02615 2E

FLOOD FORECASTING
New Vistas for Flood Investigations,
W74-02625 2E

FLOOD FREQUENCY
New Vistas for Flood Investigations,
W74-02625 2E

FLOOD MAPPING
Application of ERTS-1 Imagery to Flood Inundation Mapping,
W74-02591 7B

Assessment of Flood Damage in Arizona by Means of ERTS-1 Imagery,
W74-02592 7B

FLOOD PLAIN ZONING
Floodplain Mapping and Planning for the 50 and 100 Year Interval Flood Zones of the Bitterroot Valley, Montana,
W74-02215 4A

FLOOD PROTECTION
Annual Compilation and Analysis of Hydrologic Data for Green Creek, Brazos River Basin, Texas, 1971,
W74-02626 4D

FLOOD WAVES
Long Waves in Shallow Triangular Channels,
W74-02158 2E

Dam-Break Flood in a Prismatic Dry Channel,
W74-02311 8B

FLOODING
Camden Special Road District of Ray County V. Taylor, (Action by Special Road District for Mandatory Injunction Compelling Landowners to Remove Levy and to Permanently Enjoin them from Constructing Levy).
W74-02523 6E

FLOODS
Urban Storm Drainage Activities in New York,
W74-02171 4A

Severe Floods at New Braunfels, Texas, May 1972,
W74-02173 2E

Flood of June 1972 at Corning, New York,
W74-02479 7C

Application of ERTS-1 Imagery to Flood Inundation Mapping,
W74-02591 7B

Assessment of Flood Damage in Arizona by Means of ERTS-1 Imagery,
W74-02592 7B

Floods at Martinsburg and Vicinity, West Virginia,
W74-02615 2E

New Vistas for Flood Investigations,
W74-02625 2E

FLORIDA
Applicability of the Interceptor Waterway Concept to the Rookery Bay Sanctuary,
W74-02205 4A

Nitrogen, Phosphorus, and Trace Elements in Florida Surface Waters, 1970-71,
W74-02476 5A

Challenges to Federalism: State Legislation Concerning Marine Oil Pollution,
W74-02502 5G

Easements: Judicial and Legislative Protection of the Public's Rights in Florida's Beaches,
W74-02508 6E

City of Hollywood V. Yarborough (Review of Public Service Commission Order Authorizing Utility to Provide Water Service in Unincorporated Area which Petitioner Claimed to have Exclusive Control Over).
W74-02530 6E

Summary of Hydrologic Conditions in Collier County, Florida, 1972,
W74-02622 2A

Hydrogeologic Aspects of a Proposed Sanitary Landfill Near Old Tampa Bay, Florida,
W74-02628 5E

Basic Water-Quality Data for Pollution Abatement Plan, Tampa Bay Area, Florida,
W74-02629 5B

FLOTATION
Treatment of Tannery Effluents by Physical-Chemical Processes,
W74-02175 5D

In Situ Treatment Methods for Hazardous Material Spills,
W74-02179 5D

FLOTSAM
Water Pollution Control,
W74-02495 5G

FLOW AROUND OBJECTS
Flow in Open Channels With Smooth Curved Boundaries,
W74-02312 8B

FLOW CHARACTERISTICS
Analysis of Internal Flow Characteristics of a Smooth-Disk Water-Brake Dynamometer,
W74-02475 8C

FLOW MEASUREMENT
An Enclosed Weir for Small Streams in Snow Country,
W74-02249 7B

FLOW RATES
Ultrasonic River Flow Measurement,
W74-02250 2E

River Regimes in Iran,
W74-02298 2E

Characterization of Waste Effluents from a Commercial Pimento Canning Operation,
W74-02379 5A

FLOWMETERS
Ultrasonic River Flow Measurement,
W74-02250 2E

FLUID MECHANICS
Analysis of Internal Flow Characteristics of a Smooth-Disk Water-Brake Dynamometer,
W74-02475 8C

FLUORESCENCE
Detection of Pollutants in Water by Raman Spectroscopy,
W74-02164 5A

FLUORIDATION
Sixteen Years of Water Fluoridation in the Netherlands and Its Influence on Dental Decay,
W74-02229 5F

FLUORIDES
Separation and Gas-Chromatographic Determination of Traces of Fluoride, (Abtrennung und gas-chromatographische Bestimmung von Fluoridspuren),
W74-02431 5A

FLUORINE
Determination of Trace Fluorine in Biological Materials by Photonuclear Activation Analysis,
W74-02361 5A

FLUORINE CONTENT
Some Regularities of Sr90 Accumulation in the Body of a Rat with a High Fluorine Content in Its Drinking Water, (In Russian),
W74-02195 5C

FLURIDE
Relation of Mineral and Hormone Metabolism to Intake of Water with a High Natural Content of Fluoride,
W74-02235 5C

FOAM SEPARATION
Treatment of Tannery Effluents by Physical-Chemical Processes,
W74-02175 5D

FOAMING
Persistent Sea-Foam Masses -- A Problem Solved,
W74-02180 5B

FOOD CHAINS
Computer Simulation of Trophic Level Interrelationships in Cayuga Lake,
W74-02216 5C

FOOD PROCESSING INDUSTRY
Characterization and Treatment of Fish Processing Plant Effluents in Canada,
W74-02262 5D

FOREIGN COUNTRIES
Proposed Water-Resources and Land-Capability Investigation, Arusha Region, Tanzania,
W74-02627 2A

FOREIGN RESEARCH
Shallow Ground Water in the Zamin Dawar Area, Helmand Province, Afghanistan,
W74-02472 4B

FOREST FIRES
Prescribed Fire Effects on Water Repellency, Infiltration and Retention in Mixed-Conifer Litter, Duff and Soil,
W74-02442 4C

FOREST MANAGEMENT
Prescribed Fire Effects on Water Repellency, Infiltration and Retention in Mixed-Conifer Litter, Duff and Soil,
W74-02442 4C

FOREST WATERSHEDS
Hydrologic Simulation Model of Colorado Subalpine Forest,
W74-02248 7B

FORESTS
Influence of the Soil Water Level on Microbial Processes of Pasture and Forest Communities,
W74-02194 2G

Water Regime of Solonchak Solonetzes in Open Areas of Forests in the North Caspian Sea Region, (Vodnyy rezhim solonchakovykh solontsov na polyanakh lesnykh nasazhdeniy Severnogo Prikaspiya),
W74-02301 2G

FORT LOUDOUN RESERVOIR (TENN)
Impact of Sewage Treatment Modifications on Water Quality of a Reservoir,
W74-02483 5D

FOSSIL FUELS
Accumulation of Fossil CO2 in the Atmosphere and the Sea,
W74-02375 5C

FRACTIONATION
Use of Sephadex Gel for the Fractionation of Organic Matter in Lake Water, (In Russian),
W74-02343 5A

FRANCE (VERCORS MASSIVE)
Plant Associations of the Southern Vercors Massive: Associations of Springs and Marshlands at Subalpine Elevation,
W74-02243 2I

FREE SURFACES
Ground Water Seepage Patterns to Wells for Unconfined Flow--Phase II,
W74-02206 2F

Flow in Open Channels With Smooth Curved Boundaries,
W74-02312 8B

FREQUENCY ANALYSIS
Floodplain Mapping and Planning for the 50 and 100 Year Interval Flood Zones of the Bitterroot Valley, Montana,
W74-02215 4A

Probability Analysis in an Approximate Theory of Movement of Water Masses, (Veroyatnostnyy analiz v priblizhennoy teorii peremeshcheniya vodnykh mass),
W74-02305 2E

Statistical Analysis of North Carolina Precipitation Data,
W74-02632 2B

FRESHWATER FISH
Some Chemical and Biological Characteristics of the Mississippi River Bordering Iowa,
W74-02363 5B

FRUIT CROPS
Survey of Methods of Treating Wine and Grape Waste Water,
W74-02329 5D

FUEL OIL
Atomic Absorption and Fluorescence Spectrometry with a Carbon Filament Atom Reservoir. Part XIV. The Determination of Vanadium in Fuel Oils,
W74-02400 5A

FUNGOID GROWTH
Occurrence of Saprochaete saccharophyla Coker Et Shanor in Fungoid Growth below the Discharge of Breweries, (In Czech),
W74-02242 5B

FURROW IRRIGATION
Effect of Irrigation, Fertilization, and Other Cultural Practices on Water Quality,
W74-02321 5C

GAGES
Measuring Snowfall, A Critical Factor for Snow Resource Management,
W74-02184 2C

GAMMA RADIATION
Calculation of Dose Conversion Factors for 60Co Gamma Radiation in Water, (In German),
W74-02198 5B

GAMMA RAY SPECTROSCOPY
A Pneumatic Sample Changer for Gamma-Ray Spectroscopy,
W74-02407 7B

GAMMA RAYS
An Airborne Gamma Survey of Moisture Content in the Surface Detention Layer, (Samoletnaya gamma-s'yemka zapasov vlagi v sloye poverkhnostnogo zaderzhaniya),
W74-02307 2G

GAMMA SPECTROMETRY
Distribution of Caesium-137 in British Coastal Waters,
W74-02365 5B

GAS BUBBLE ELECTRIFICATION
Analysis by Means of Gas Bubble Electrification,
W74-02406 2K

GAS CHROMATOGRAPHY
Analytical Applications of Gas Chromatography of Metal Chelates,
W74-02366 2K

Sampling Techniques in Chromatography,
W74-02372 7B

Gas-Liquid Chromatographic Determination of Chlorfenvinphos in Milk, Eggs, and Body Tissues of Cattle and Chickens,
W74-02384 5A

Intercalibration of Analyses of Recently Biosynthesized Hydrocarbons and Petroleum Hydrocarbons in Marine Lipids,
W74-02390 5A

The Determination of Pentachlorophenol and Hexachlorophene in Human Adipose Tissue,
W74-02391 5A

Polychlorinated Terphenyls in Paperboard Samples,
W74-02392 5A

Enhancement of the Sensitivity and Selectivity of the Coulson Electrolytic Conductivity Detector to Chlorinated Hydrocarbon Pesticides,
W74-02413 5A

The Determination of Phenols in Aqueous Effluents,
W74-02417 5A

Occurrence of Hexachlorophene and Pentachlorophenol in Sewage and Water,
W74-02426 5A

Separation and Gas-Chromatographic Determination of Traces of Fluoride, (Abtrennung und gas-chromatographische Bestimmung von Fluoridspuren),
W74-02431 5A

GAS LIQUID CHROMATOGRAPHY
Persistence of Endothall in Aquatic Environment as Determined by Gas-Liquid Chromatography,
W74-02381 5B

GASES
'Clean Energy Via Coal Gasification',
W74-02462 6B

Some Problems in Age Determination of Groundwater (Nekotoryye voprosy rascheta vozrasta podzemnykh vod),
W74-02611 2F

GASPE
Structural Lineaments of Gaspe from ERTS Imagery,
W74-02565 7B

GAUSS-ELIMINATION
A Conjunctive use Surface Water-Ground Water Simulator,
W74-02452 2F

GENERATION
The Effect of Temperature on the Generation Time of a Bacterial Community in Lake Water,
W74-02557 5B

GEOLOGIC CONTROL
Geologic Control of Ground Water Movement in a Portion of the Delaware Piedmont,
W74-02320 2F

GEOLOGIC MAPPING
ERTS-1 Image Contributes to Understanding of Geologic Structures Related to Managua Earthquake, 1972,
W74-02561 7B

Recognition of Surface Lithologic and Topographic Patterns in Southwest Colorado with ADP Techniques,
W74-02562 7B

ERTS-1 Imagery as an Aid to the Definition of the Geotectonic Domains of the Southern African Crystalline Shield,
W74-02563 7B

New Aspects on the Tectonic of the Alps and the Apennines Revealed by ERTS-1 Data,
W74-02564 7B

Structural Lineaments of Gaspe from ERTS Imagery,
W74-02565 7B

Lineaments in Coastal Plain Sediments as Seen in ERTS Imagery,
W74-02566 7B

Structural Interpretations Based on ERTS-1 Imagery, Bighorn Region, Wyoming-Montana,
W74-02568 7B

Applicability of ERTS-1 to Lineament and Photogeologic Mapping in Montana--Preliminary Report,
W74-02569 7B

GEOLOGIC TIME
Some Problems in Age Determination of Groundwater (Nekotoryye voprosy rascheta vozrasta podzemnykh vod),
W74-02611 2F

GEOMETRIC PROGRAMMING
Optimization of Industrial Systems with the Separable Programming and the Generalized Reduced Gradient Methods,
W74-02213 5G

GEOMORPHOLOGY
The Importance of Sediment Transport in Water Resources Planning,
W74-02351 4D

Detailed Analysis of Short-Term Variations in Beach Morphology (And Concurrent Dynamic Processes) for Summer and Winter Periods, 1971-1972, Plum Island, Massachusetts,
W74-02649 2E

GEORGIA
Water and Sewerage Improvements Needed in 1975 in Chatham County, Georgia.
W74-02186 5D

Soil Pollution from Cattle Feedlots in Georgia,
W74-02210 5B

A Water and Sewer Plan: Greene County, Georgia.
W74-02334 5D

A Water and Sewer Plan: Morgan County, Georgia.
W74-02335 5D

A Water and Sewer Plan: Madison County, Georgia.
W74-02336 5D

A Water and Sewer Plan: Walton County, Georgia.
W74-02337 5D

Northeast Georgia Area Water and Sewer Systems Plan and Capital Improvement Program.
W74-02339 3D

Segars V. Cornwell (Property Owner Sues for Malicious Prosecution Against Corporation).
W74-02527 6E

GEOTHERMAL STUDIES
A Hydrogeothermal Description of Groundwater in Upper Cretaceous Deposits in the Southeast Aral Sea Area (Gidrogeotermicheskaya kharakteristika podzemnykh vod verkhnego mela Yugo-Vostochnogo Priaral'ya),
W74-02609 2F

GERMANIUM
Anionic Exchange Separations of the Elements that can be Extracted with Tributyl Phosphate. II, (Anionenaustauschtrennungen der mit Tributylphosphat extrahierbaren Elemente. II),
W74-02432 2K

GERMANY
Waste Water Research for the Pulp and Paper Industry at the Darmstadt Technological Institute (Abwasserforschung fuer die Papier-und Zellstoffindustrie an der TH Darmstadt),
W74-02257 5D

GIBEL
Accumulation of Strontium and Calcium in Freshwater Fishes of Japan,
W74-02197 5C

GLACIER BASIN HYDROLOGY
Combined Heat, Ice and Water Balances at Selected Glacier Basins. Part II: Specifications, Standards and Data Exchange.
W74-02470 2C

GLACIER SURGES
Bear Glacier Has Come Alive (Lednik Medvezhiy ozhil),
W74-02614 2C

GLACIERS
Evaluation of ERTS Imagery for Mapping and Detection of Changes of Snowcover on Land and on Glaciers,
W74-02604 7B

Bear Glacier Has Come Alive (Lednik Medvezhiy ozhil),
W74-02614 2C

GLACIOHYDROLOGY
Combined Heat, Ice and Water Balances at Selected Glacier Basins. Part II: Specifications, Standards and Data Exchange.
W74-02470 2C

GLACIOLOGY
Combined Heat, Ice and Water Balances at Selected Glacier Basins. Part II: Specifications, Standards and Data Exchange.
W74-02470 2C

GOLDSTREAM CREEK (ALASKA)
Effects of Highway Bridge Construction on a Subarctic Stream,
W74-02295 4C

GOUNDWATER POLLUTION SOURCES
Soil Pollution from Cattle Feedlots in Georgia,
W74-02210 5B

GOVERNMENTS
The CPAR Program - Government-Industry Cooperation in Pollution Abatement Research,
W74-02274 5D

Indices of National Interest in the Oceans,
W74-02499 6E

GRADIENT METHODS
Optimization of Industrial Systems with the Separable Programming and the Generalized Reduced Gradient Methods,
W74-02213 5G

GRAPE WASTE WATER
Survey of Methods of Treating Wine and Grape Waste Water,
W74-02329 5D

GRASSHOPPERS
Grasshoppers and Crickets in the Karshi Steppe, (In Russian),
W74-02239 3F

GRASSLANDS
Plant Nutrient Concentrations in Runoff from Fertilized Cultivated Erosion Plots and Prairie in Eastern South Dakota,
W74-02154 5B

Detection, Mapping and Estimation of Rate Spread of Grass Fires from Southern African ERTS-1 Imagery,
W74-02576 7B

Preliminary Evaluation of ERTS-1 for Determining Numbers and Distribution of Prairie Ponds and Lakes,
W74-02597 7B

GRAVITATIONAL WATER
Migration of Substances with Surface and Gravitational Waters in Soils of Geochemically Related Landscapes of Baraba, (Migratsiya veshchestv s pverkhnostnymi i gravitatsionnymi vodami v pochvakh geokhimicheski sopryazhennykh landshaftov Baraby),

MACROPHYTES
An Ecological Evaluation of Stream Eutrophication,
W74-02201 5C

MADAGASCAR (LAKE ITASY-LAKE MANTOSA)
Comparative Biology of Tilapia rendalli (Boulenger) (Pisces cichlidae) in Lake Itasy and Lake Mantasoa, (In French),
W74-02344 2H

MADISON COUNTY (GEO)
A Water and Sewer Plan: Madison County, Georgia.
W74-02336 5D

MAGNESIUM
Iron, Zinc, Magnesium, and Copper Concentrations in Body Meat of the Blue Crab, Callinectes sapidus,
W74-02409 5A

MAINE
Ogunquit Sand Dune Land Stabilization Measure, York County in Maine, Threshold to Maine Resource Conservation and Development Project (Final Environmental Statement).
W74-02504 4A

State of Maine V. M/V Tamano (Suit to Recover Damages Incurred as Result of Discharge into Waters of Bay).
W74-02525 6E

MAIZE GROWTH
The Effect of Soil Moisture Upon the Availability of Potassium and its Influence on the Growth of Young Maize Plants (Zea mays L.),
W74-02554 3F

MANAGUA (NICARAGUA)
ERTS-1 Image Contributes to Understanding of Geologic Structures Related to Managua Earthquake, 1972,
W74-02561 7B

MANGANESE
Factors Affecting the Manganese Status in Soils of the U.A.R.,
W74-02200 2G

MAPPING
Floodplain Mapping and Planning for the 50 and 100 Year Interval Flood Zones of the Bitterroot Valley, Montana,
W74-02215 4A

Mapping Average Annual Surface Water Resources of the Hydrological Regions of Nelson, New Zealand,
W74-02290 2E

Application and Consequences of Precipitation Observations in the Republic of Sudan in View of the Nomadic Life and Economy,
W74-02348 2B

ERTS-1 Investigation of Ecological Effects of Strip Mining in Eastern Ohio,
W74-02572 7B

The Use of ERTS-1 MSS Data for Mapping Strip Mines and Acid Mine Drainage in Pennsylvania,
W74-02573 7B

Mapping Atlantic Coastal Marshlands, Maryland, Georgia, Using ERTS-1 Imagery,
W74-02577 7B

Identification of Marsh Vegetation and Coastal Land Use in ERTS-1 Imagery,
W74-02578 7B

Application of ERTS-1 Imagery to Flood Inundation Mapping,
W74-02591 7B

Use of the Sri Electronic Satellite Image Analysis Console for Mapping Southern Arizona Plant Communities from ERTS-1 Imagery,
W74-02593 7B

MARICULTURE
Power, Fresh Water, and Food From Cold, Deep Sea Water,
W74-02254 3B

MARINE ENVIRONMENT
Chemistry of Marine Natural Products,
W74-02189 5B

MARINE FISH
The Distribution of Trace Metals and Fauna in the Firth of Clyde in Relation to the Disposal of Sewage Sludge,
W74-02420 5B

MARKOV PROCESSES
Statistical Analysis of North Carolina Precipitation Data,
W74-02632 2B

MARSH MANAGEMENT
Insect Pest Management in Coastal and Estuarine Habitats,
W74-02643 5G

MARSH PLANTS
Insect Pest Management in Coastal and Estuarine Habitats,
W74-02643 5G

MARSHLANDS
Plant Associations of the Southern Vercors Massive: Associations of Springs and Marshlands at Subalpine Elevation,
W74-02243 2I

Contribution of Developed and Natural Marshland Soils to Surface and Subsurface Water Quality,
W74-02327 5B

MARTINSBURG AREA (W VA)
Floods at Martinsburg and Vicinity, West Virginia,
W74-02615 2E

MASS SPECTROMETRY
The Determination of Pentachlorophenol and Hexachlorophene in Human Adipose Tissue,
W74-02391 5A

Occurrence of Hexachlorophene and Pentachlorophenol in Sewage and Water,
W74-02426 5A

Potentiality of the Coupling of Column Liquid Chromatography and Field Desorption Mass Spectrometry,
W74-02430 2K

MASSACHUSETTS
A Guide to Important Characteristics and Values of Freshwater Wetlands in the Northeast.
W74-02324 4B

Hydrology and Water Resources of the Neponset and Weymouth River Basins, Massachusetts,
W74-02480 7C

Detailed Analysis of Short-Term Variations in Beach Morphology (And Concurrent Dynamic Processes) for Summer and Winter Periods, 1971-1972, Plum Island, Massachusetts,
W74-02649 2E

MATHEMATICAL MODELS
System 21, 'Jupiter' (A Design System for Two-Dimensional Nearly-Horizontal Flows),
W74-02159 7C

Development of an 'Operations' Model for Montana's Water Resources: Middle Creek Reservoir Operation,
W74-02214 4A

Hydrologic and Watershed Modeling for Watershed Planning,
W74-02224 4D

Elevation Dependent Model for Estimating Annual Runoff,
W74-02317 2A

Accumulation of Fossil CO2 in the Atmosphere and the Sea,
W74-02375 5C

Development of Models for Analyzing Water Resources Development and Use Within a Regional Framework,
W74-02455 6A

Hymo: Problem-Oriented Computer Language for Hydrologic Modeling--Users Manual,
W74-02469 2A

Development of a Mathematical Model to Predict the Occurrence of Cynoscion arenarius in Mississippi Estuaries,
W74-02640 2L

MATHEMATICAL STUDIES
New Vistas for Flood Investigations,
W74-02625 2E

MEANDERS
Detection of Major River Bed Changes in the River Ebro (North-Eastern Spain),
W74-02589 7B

MEASUREMENT
Measuring Snowfall, A Critical Factor for Snow Resource Management,
W74-02184 2C

Salinity Corrections for Dissolved Oxygen Measurements,
W74-02424 5A

MEASUREMENTS
Quick-Time Instrumental Measurements of Wastewater Organic Characteristics,
W74-02170 5A

MEKONG DELTA
Applications of Multispectral Imagery to Water Resources Development Planning in the Lower Mekong Basin (Khemer Republic, Laos, Thailand and Viet-Nam),
W74-02590 7B

MELTING
Determination of the Microlevel Temperatures During Lake Cooling, Ice Formation, Icemelt and the Break-up of the Ice cover of a Mountain Lake, Holland Lake, Missoula County,
W74-02447 2C

MEMBRANES
Hyperfiltration (Reverse Osmosis) of Kraft Pulp Mill and Bleach Plant Wastes,
W74-02285 5D

Improving Reverse Osmosis Performance with Dynamically Formed Wood Chemical Membranes,
W74-02286 5D

MERCURY
Significance of pH and Chloride Concentration on Behavior of Heavy Metal Pollutants: Mercury (II), Cadmium (II), Zinc (II), and Lead (II),
W74-02155 5B

Applications, Involving the Iodide Ion. VIII. Direct and Indirect Determination of Mercury (I) and Analysis of Mixtures. Analysis of Chromium (VI)-Chromium (III) Mixtures. Determination of Hypochlorite,
W74-02395 5A

Amperometric Titration of Mercury (II) with EDTA, DTPA and Trien in the PPM-Range,
W74-02405 5A

Mercury in Fish, Sediments, and Water in Lake Oahe, South Dakota,
W74-02423 5A

Nature and Stability of Complex Mercury Compounds in Surface and Ground Waters,
W74-02441 5A

A Mass Balance Model of Trace Metals in Several Delaware Watersheds,
W74-02443 5B

Uptake of Mercury by Fish in Natural and Artificial Systems,
W74-02460 5B

METABOLISM (HUMAN)
Relation of Mineral and Hormone Metabolism to Intake of Water with a High Natural Content of Fluoride,
W74-02235 5C

METAL COMPLEXES
Nuclear Magnetic Resonance Relaxation Titration,
W74-02402 2K

Selection of Experimental Conditions for the Photometric Complex Formation Titrations of Metals in the PPM-Range,
W74-02404 5A

Amperometric Titration of Mercury (II) with EDTA, DTPA and Trien in the PPM-Range,
W74-02405 5A

METAL DITHIZONATES
Separation and Identification of Metal Dithizonates by Thin-Layer Chromatography and its Application in Toxicological Analysis,
W74-02360 5A

METALS
The Effects of Trace Metals on Ground Water Quality as Influenced by Soils Reflecting Differences in Organic Matter Content and Genetic Conditions,
W74-02211 5B

Selection of Experimental Conditions for the Photometric Complex Formation Titrations of Metals in the PPM-Range,
W74-02404 5A

Process for Removal of Contaminants from Wastes,
W74-02487 5D

METEOROLOGY
ERTS-1 Views the Great Lakes,
W74-02602 7B

Detailed Analysis of Short-Term Variations in Beach Morphology (And Concurrent Dynamic Processes) for Summer and Winter Periods, 1971-1972, Plum Island, Massachusetts,
W74-02649 2E

METHODOLOGY
A Summary Analysis of Nineteen Tests of Proposed Evaluation Procedures on Selected Water and Land Resource Projects.
W74-02188 6B

Extraction of Boric Acid with Aliphatic 1,3-Diols and Other Chelating Agents,
W74-02368 5A

Analyzing Heavy Ends of Crude,
W74-02378 5A

The Determination of Methyl Mercury in Urine,
W74-02387 5A

Intercalibration of Analyses of Recently Biosynthesized Hydrocarbons and Petroleum Hydrocarbons in Marine Lipids,
W74-02390 5A

Applications, Involving the Iodide Ion. VIII. Direct and Indirect Determination of Mercury (I) and Analysis of Mixtures. Analysis of Chromium (VI)-Chromium (III) Mixtures. Determination of Hypochlorite,
W74-02395 5A

METHYLMERCURY
The Determination of Methyl Mercury in Urine,
W74-02387 5A

METHYLMERCURY COMPOUNDS
Nature and Stability of Complex Mercury Compounds in Surface and Ground Waters,

Municipal Water Planning--Mixed Integer Approach,
W74-02223 3D

NAPLES (FLA)
Summary of Hydrologic Conditions in Collier County, Florida, 1972,
W74-02622 2A

NATIONAL WATER COMMISSION
Report by the National Water Commission--A Review,
W74-02463 6B

NATURAL GAS
'Clean Energy Via Coal Gasification',
W74-02462 6B

NATURAL ORGANICS
Chemistry of Marine Natural Products,
W74-02189 5B

NATURAL RESOURCES
Legal Developments in Canadian Water Management,
W74-02505 6E

NATURAL WATERS
Comparing the Quality of Our Waters,
W74-02428 5A

NAVIGABLE WATER
In RE Chinese Maritime Trust, Ltd., (Wreck Obstructing Navigable Waters of the Panama Canal).
W74-02513 6E

NAVIGATION
In RE Chinese Maritime Trust, Ltd., (Wreck Obstructing Navigable Waters of the Panama Canal).
W74-02513 6E

NEARSHORE PROCESSES
An Annotated Bibliography of Aerial Remote Sensing in Coastal Engineering,
W74-02646 2L

NEBRASKA
A Study of Factors Influencing the Nitrogen and Phosphorus Contents of Nebraska Waters,
W74-02151 5B

Evaluation of Nitrate Content of Ground Water in Hall County, Nebraska,
W74-02465 5B

NEPONSET RIVER BASIN (MASS.)
Hydrology and Water Resources of the Neponset and Weymouth River Basins, Massachusetts,
W74-02480 7C

NETHERLANDS
Sixteen Years of Water Fluoridation in the Netherlands and Its Influence on Dental Decay,
W74-02229 5F

NEUTRON ACTIVATION ANALYSIS
A Comparison of the Content of Microelements in the Water of the River Danube Near Vienna and Belgrade for 1961-1970 (Ein Vergleich des Gehaltes an Spurenelementen im Donauwasser bei Wien und Beograd fue 1961-1970),
W74-02436 5A

NEVADA
Water-Resources Appraisal of Fish Lake Valley, Nevada and California,
W74-02616 2A

NEW BRAUNFELS (TEX)
Severe Floods at New Braunfels, Texas, May 1972,
W74-02173 2E

NEW HAMPSHIRE
Regional Wastewater Facilities Study.
W74-02338 5D

Yoffe V. Special Board, Chapter 387, (State Denial of License to Exploit Natural Resources of a Lake Bed).
W74-02514 6E

NEW JERSEY
Water Resources Development in the Mullica River Basin,
W74-02450 5C

State of New Jersey, Department of Environmental Protection V. Jersey Central Power and Light Company (Action to Enforce Penalty Provision for Discharge of Harmful Substance into Tidal Waters).
W74-02520 6E

NEW MEXICO
State Water Plan, Proceedings of 18th Annual New Mexico Water Conference.
W74-02456 6B

State Water Plan,
W74-02457 6B

Population Projectsions for the New Mexico State Water Plan,
W74-02458 6B

A Study of Water Used on Urban Landscapes,
W74-02459 6B

Uptake of Mercury by Fish in Natural and Artificial Systems,
W74-02460 5B

Another Rio Grande for New Mexico,
W74-02461 3A

'Clean Energy Via Coal Gasification',
W74-02462 6B

NEW YORK
An Investigation of the Physical Effects of Thermal Discharges into Cayuga Lake,
W74-02178 5B

Persistent Sea-Foam Masses -- A Problem Solved,
W74-02180 5B

Surface Quality Assessment of Natural Bodies of Water,
W74-02181 5A

Organic Films on Natural Waters: Their Retrieval, Identification, and Modes of Elimination,
W74-02182 5A

Computer Simulation of Trophic Level Interrelationships in Cayuga Lake,
W74-02216 5C

Experimental Studies on Phytoplankton Succession in Cayuga Lake,
W74-02217 5C

Flood of June 1972 at Corning, New York,
W74-02479 7C

United States V. Lindsay (Government's Action Against City for Alleged Violation of Refuse Act and New York Harbor Act, and for Creation of Public Nuisance).
W74-02526 6E

NEW YORK CITY
Urban Storm Drainage Activities in New York,
W74-02171 4A

NEW ZEALAND
The Water Balance of New Zealand,
W74-02291 2A

NEW ZEALAND (BANKS PENINSULA)
Slope Aspect and Tunnel Erosion in the Loess of Banks Peninsula, New Zealand,
W74-02288 2J

NEW ZEALAND (NELSON)
Mapping Average Annual Surface Water Resources of the Hydrological Regions of Nelson, New Zealand,
W74-02290 2E

NEW ZEALAND (NORTH ISLAND)
The Relationships Between Land Use and Erosion in the Central North Island, New Zealand,
W74-02287 4D

NEWPORT RIVER (NC)
A Report on Bacterial Pollution Affecting Shellfish Harvesting in Newport River, North Carolina.
W74-02621 5B

NIGERIA
On the Origin of the Wet-Season Form of Zonocerus variegatus (L.) (Orth., Acrididae) In Southern Nigeria, with Some Biological Notes,
W74-02238 2I

NITRATES
Minimizing Nitrate Seepage from the Hula Valley into Lake Kinneret (Sea of Galilee): 1. Enhancement of Nitrate Reduction by Sprinkling and Flooding,
W74-02153 5B

Effect of Feedlot Manure on Soil and Water Quality,
W74-02157 5B

The Chemical Composition and Flow of the South Winterbourne in Dorset,
W74-02190 2K

Soil Pollution from Cattle Feedlots in Georgia,
W74-02210 5B

Evaluation of Nitrate Content of Ground Water in Hall County, Nebraska,
W74-02465 5B

NITRIFICATION
Influence of Soil Structure and Moisture on Nitrification,
W74-02192 2G

Nitrification of BOD-Containing Water,
W74-02485 5D

NITRILOTRIACETIC ACID
Current Status of the Environmental and Human Safety Aspects of Nitrilotriacetic Acid (NTA),
W74-02394 5B

NITROGEN
A Study of Factors Influencing the Nitrogen and Phosphorus Contents of Nebraska Waters,
W74-02151 5B

Contribution of Developed and Natural Marshland Soils to Surface and Subsurface Water Quality,
W74-02327 5B

Seasonal Changes in the Organic Forms of Carbon, Nitrogen and Phosphorus in Sea Water at El in the English Channel During 1968,
W74-02369 5B

Nitrogen, Phosphorus, and Trace Elements in Florida Surface Waters, 1970-71,
W74-02476 5A

NITROGEN COMPOUNDS
Chemistry of Marine Natural Products,
W74-02189 5B

NMR RELAXATION TITRATION
Nuclear Magnetic Resonance Relaxation Titration,
W74-02402 2K

NORTH CAROLINA
A Report on Bacterial Pollution Affecting Shellfish Harvesting in Newport River, North Carolina.
W74-02621 5B

Statistical Analysis of North Carolina Precipitation Data,
W74-02632 2B

Insect Pest Management in Coastal and Estuarine Habitats,
W74-02643 5G

NORTH DAKOTA
Flow Analysis of Hydraulic Connectors in Artificial Recharge Systems, A Model Study,
W74-02219 4B

NUCLEAR ENERGY
Another Rio Grande for New Mexico,
W74-02461 3A

NUCLEAR MAGNETIC RESONANCE
Nuclear Magnetic Resonance Relaxation Titration,
W74-02402 2K

Analysis of Alkyl Ethoxylates by NMR,
W74-02408 5A

NUCLEAR POWER PLANTS
Studies of the Sinking Plume Phenomenon,
W74-02644 5C

Sedimentation and Scour Off Nuclear Power Plants,
W74-02645 2J

NUCLEAR POWERPLANTS
The Use of Power Plant Heat in a Physical-Chemical Domestic Wastewater Renovation System,
W74-02208 5D

NUMERICAL ANALYSIS
System 21, 'Jupiter' (A Design System for Two-Dimensional Nearly-Horizontal Flows),
W74-02159 7C

NUTRIENTS
Plant Nutrient Concentrations in Runoff from Fertilized Cultivated Erosion Plots and Prairie in Eastern South Dakota,
W74-02154 5B

Experimental Studies on Phytoplankton Succession in Cayuga Lake,
W74-02217 5C

Effect of Irrigation, Fertilization, and Other Cultural Practices on Water Quality,
W74-02321 5C

NUTRITION
Plant Associations of the Southern Vercors Massive: Associations of Springs and Marshlands at Subalpine Elevation,
W74-02243 2I

OBSERVATION WELLS
Preliminary Analysis of ERTS-Relayed Water-Resources Data in the Delaware River Basin,
W74-02595 7B

OBSTRUCTION TO FLOW
Camden Special Road District of Ray County V. Taylor, (Action by Special Road District for Mandatory Injunction Compelling Landowners to Remove Levy and to Permanently Enjoin them from Constructing Levy).
W74-02523 6E

OCEAN DUMPING (WASTES)
Monitoring Ocean Dumping with ERTS-1 Data,
W74-02580 7B

OCEAN WAVES
Surface and Internal Waves, (Poverkhnostnyye i vnutrenniye volny),
W74-02299 2E

OHIO
Strontium, Calcium and the Isotopic Composition of Strontium in Underground Waters from the Scioto River Basin, Ohio,
W74-02218 2F

OIL
A Modified Extraction Method for Determination of Mineral Oil in Sea Water,
W74-02388 5A

OIL CHARACTERIZATION
Analyzing Heavy Ends of Crude,
W74-02378 5A

OIL POLLUTION
Surface Quality Assessment of Natural Bodies of Water,
W74-02181 5A

Fate of Petroleum Hydrocarbons In Beach Sand,
W74-02473 5B

Apparatus for Confining Floating Pollutants,
W74-02488 5G

Oil Skimming Apparatus,
W74-02491 5G

Underwater Tanker Ballast Water/Oil Separation,
W74-02492 5G

Floating Water Jet for Oil Slick Control,
W74-02494 5G

Water Pollution Control,
W74-02495 5G

Challenges to Federalism: State Legislation Concerning Marine Oil Pollution,
W74-02502 5G

State of Maine V. M/V Tamano (Suit to Recover Damages Incurred as Result of Discharge into Waters of Bay).
W74-02525 6E

Hydrocarbon-Oxidizing Bacteria and Their Possible Use as Controlling Agents of Oil Pollution in the Ocean,
W74-02618 5G

OIL SPILLS
The Formation of Water-In-Oil Emulsions Subsequent to an Oil Spill,
W74-02377 5B

Apparatus for Confining Floating Pollutants,
W74-02488 5G

Oil Skimming Apparatus,
W74-02491 5G

OIL SPILLS

Floating Water Jet for Oil Slick Control,
W74-02494 5G

Water Pollution Control,
W74-02495 5G

State of Maine V. M/V Tamano (Suit to Recover Damages Incurred as Result of Discharge into Waters of Bay).
W74-02525 6E

Feasibility Study of the Sand Sinking Method of Combatting a Major Oil Spill in the Ocean Environment,
W74-02635 5G

Investigation of Sorbents for Removing Oil Spills from Waters,
W74-02636 5G

OILY WATER

Organic Films on Natural Waters: Their Retrieval, Identification, and Modes of Elimination,
W74-02182 5A

Hydrocarbon-Oxidizing Bacteria and Their Possible Use as Controlling Agents of Oil Pollution in the Ocean,
W74-02618 5G

Electrochemical Flotation Concept for Removing Oil from Water,
W74-02634 5D

OPEN CHANNEL FLOW

The Turbulent Temperature Mixing Layer,
W74-02162 8B

Flow in Open Channels With Smooth Curved Boundaries,
W74-02312 8B

OPTICAL PROPERTIES

Optical Constants of Water in the 200-nm to 200-Micrometer Wavelength Region,
W74-02167 2K

OPTIMIZATION

Optimization of Industrial Systems with the Separable Programming and the Generalized Reduced Gradient Methods,
W74-02213 5G

OPTIMUM DEVELOPMENT PLANS

Hydrologic and Watershed Modeling for Watershed Planning,
W74-02224 4D

Cost Effectiveness of Current Environmental Engineering Practices,
W74-02225 5D

OREGON

Water Quality Control Program at Publishers Paper Co.,
W74-02275 5D

ORGANIC COMPOUNDS

Chemistry of Marine Natural Products,
W74-02189 5B

Interpretation of Infrared Specta Using Pattern Recognition Techniques,
W74-02376 2K

A High-Speed Liquid Chromatograph with a Flow-Spectrofluorimetric Detector and the Ultramicro-Determination of Aromatic Compounds,
W74-02397 5A

Chlorination Effects on Organic Constituents in Effluents from Domestic Sanitary Sewage Treatment Plants,
W74-02416 5C

Potentiality of the Coupling of Column Liquid Chromatography and Field Desorption Mass Spectrometry,
W74-02430 2K

Fate of Petroleum Hydrocarbons In Beach Sand,
W74-02473 5B

Hydrocarbon-Oxidizing Bacteria and Their Possible Use as Controlling Agents of Oil Pollution in the Ocean,
W74-02618 5G

ORGANIC HYDROXY ACIDS

Ion-Exchange Separations on Mixed Columns,
W74-02398 5A

ORGANIC MATTER

Use of Sephadex Gel for the Fractionation of Organic Matter in Lake Water, (In Russian),
W74-02343 5A

ORGANIC SOILS

The Effects of Trace Metals on Ground Water Quality as Influenced by Soils Reflecting Differences in Organic Matter Content and Genetic Conditions,
W74-02211 5B

Contribution of Developed and Natural Marshland Soils to Surface and Subsurface Water Quality,
W74-02327 5B

ORGANIC SOLVENTS

Separation and Identification of Metal Dithizonates by Thin-Layer Chromatography and its Application in Toxicological Analysis,
W74-02360 5A

Organic Desorption from Carbon-II. The Effect of Solvent in the Desorption of Phenol from Wet Carbon,
W74-02418 5A

ORGANIC WASTES

Using the Adsorption Method on Activated Charcoal with Chloroform Extraction (CCE) for Evaluating Water Pollution by Organic Substances, (In Russian),
W74-02232 5B

The Effects on Runoff, Groundwater, and Land of Irrigating With Cattle Manure Slurries,
W74-02326 5D

ORGANOPHOSPHORUS PESTICIDES

Gas-Liquid Chromatographic Determination of Chlorfenvinphos in Milk, Eggs, and Body Tissues of Cattle and Chickens,
W74-02384 5A

OSAKA BAY (JAPAN)

Polluted and Turbid Water Masses in Osaka Bay and Its Vicinity Revealed with ERTS-A Imageries,
W74-02586 7B

OSCILLATING WATER TUNNEL

A Shear Plate for Use in Oscillatory Flow,
W74-02161 2E

OSMIUM

Microdetermination of Arsenic (III) and Osmium (VIII) through Osmium-Thiourea Reaction,
W74-02396 5A

OUTFALL SEWERS

Water Quality Characteristics of Storm Sewer Discharges and Combined Sewer Overflows,
W74-02345 5B

OXIDATION

The Removal of Organic Compounds in the Production of Potable Water,
W74-02265 5F

OXONES

Isolation and Cleanup of Organophosphorus Insecticides and Their Oxones from Animal Tissues,
W74-02403 5A

OXYGENATION

In-Pipe Wastewater Cleanup.
W74-02269 5D

PANAMA CANAL

In RE Chinese Maritime Trust, Ltd., (Wreck Obstructing Navigable Waters of the Panama Canal).
W74-02513 6E

PAPERBOARD

Polychlorinated Terphenyls in Paperboard Samples,
W74-02392 5A

PARALLEL DITCHES

Ground Water Seepage Patterns to Wells for Unconfined Flow--Phase II,
W74-02206 2F

PARAOXON

Photolysis of Parathion (O,O-Diethyl-O- (4-Nitrophenyl) Thiophosphate). New Products,
W74-02380 5B

PARATHION

Photolysis of Parathion (O,O-Diethyl-O- (4-Nitrophenyl) Thiophosphate). New Products,
W74-02380 5B

PARTICLE SHAPE

Investigation of Fall Velocity of Sediments in Mountain Streams, (Issledovaniye gidravlicheskoy krupnosti nanosov gornykh rek),
W74-02306 2J

PARTICLE SIZE

Investigation of Fall Velocity of Sediments in Mountain Streams, (Issledovaniye gidravlicheskoy krupnosti nanosov gornykh rek),
W74-02306 2J

PASTURES

Influence of the Soil Water Level on Microbial Processes of Pasture and Forest Communities,
W74-02194 2G

PATENTS

Method for Removing Suspended Solids from Liquids,
W74-02484 5D

Nitrification of BOD-Containing Water,
W74-02485 5D

Method and Apparatus for Electrolytic Treatment of Sewage,
W74-02486 5D

Process for Removal of Contaminants from Wastes,
W74-02487 5D

Apparatus for Confining Floating Pollutants,
W74-02488 5G

Sewage Treatment Apparatus,
W74-02489 5D

Multi-Stage Flash Evaporator,
W74-02490 3A

Oil Skimming Apparatus,
W74-02491 5G

Underwater Tanker Ballast Water/Oil Separation,
W74-02492 5G

System for Monitoring Contaminants in Liquids,
W74-02493 5A

Floating Water Jet for Oil Slick Control,
W74-02494 5G

Water Pollution Control,
W74-02495 5G

Internally Interconnected Multi-Stage Distillation System,
W74-02496 3A

'ATH OF POLLUTANTS
Agricultural Chemicals in Surface Runoff, Ground Water, and Soil: 1. Endrin,
W74-02152 5B

Minimizing Nitrate Seepage from the Hula Valley into Lake Kinneret (Sea of Galilee): 1. Enhancement of Nitrate Reduction by Sprinkling and Flooding,
W74-02153 5B

Plant Nutrient Concentrations in Runoff from Fertilized Cultivated Erosion Plots and Prairie in Eastern South Dakota,
W74-02154 5B

Experimental and Predicted Movement of Three Herbicides in a Water-Saturated Soil,
W74-02156 5B

Dispersion in Flow from a Continuous Source at Sea,
W74-02163 5B

The Effects of Trace Metals on Ground Water Quality as Influenced by Soils Reflecting Differences in Organic Matter Content and Genetic Conditions,
W74-02211 5B

Field Tests on Transverse Mixing in Rivers,
W74-02318 5B

Complex Behaviour of Cobalt in the Danube River,
W74-02373 5B

Remote Detection of Aerosol Pollution by ERTS,
W74-02575 7B

Monitoring Ocean Dumping with ERTS-1 Data,
W74-02580 7B

ATTERN RECOGNITION
Interpretation of Infrared Specta Using Pattern Recognition Techniques,
W74-02376 2K

EAK DISCHARGE
California High Water, 1970-1971,
W74-02474 2E

PELOBATES-FUSCUS
The Age Group Distribution of Pelobates fuscus (Laur.) at the Kuibyshev Reservoir Shores (In Russian),
W74-02641 2H

Age Structure of Populations of Some Amphibia on Banks of Water Reservoirs (In Czech),
W74-02650 2H

PELTIER EFFECT
Design, Operation, and Temperature Sensitivity of A Thermocouple Psychrometer Moisture Potentiometer Based on the Peltier Effect, (Konstruktsiya, metodika primeneniya i temperaturnaya chuvstvitel'nost' termoparnogo psikhrometrichesko go vlagopotentsiometra, osnovannogo na effekte Pel't'ye),
W74-02303 2G

PENALTIES (LEGAL)
State of New Jersey, Department of Environmental Protection V. Jersey Central Power and Light Company (Action to Enforce Penalty Provision for Discharge of Harmful Substance into Tidal Waters).
W74-02520 6E

PENNSYLVANIA
Hurricane Agnes Floods East Mahantango Creek,
W74-02174 2E

PENTACHLOROPHENOL
Occurrence of Hexachlorophene and Pentachlorophenol in Sewage and Water,
W74-02426 5A

PERIPHYTON
An Ecological Evaluation of Stream Eutrophication,
W74-02201 5C

PERMEABILITY
Geologic Control of Ground Water Movement in a Portion of the Delaware Piedmont,
W74-02320 2F

PERMITS
Yoffe V. Special Board, Chapter 387, (State Denial of License to Exploit Natural Resources of a Lake Bed).
W74-02514 6E

PERU
Scientific Aspects of Maritime Sovereignty Claims,
W74-02498 6E

PEST MANAGEMENT
Insect Pest Management in Coastal and Estuarine Habitats,
W74-02643 5G

PESTICIDE FORMULATIONS
Chlorodioxins in Pesticides, Soils, and Plants,
W74-02371 5B

PESTICIDE KINETICS
Dissipation and Phytotoxicity of Dicamba Residues in Water,
W74-02370 5B

Chlorodioxins in Pesticides, Soils, and Plants,
W74-02371 5B

Persistence of Endothall in Aquatic Environment as Determined by Gas-Liquid Chromatography,
W74-02381 5B

Rates and Products of Decomposition of 2,2-Dibromo-3-Nitrilopropionamide,
W74-02382 5B

PESTICIDE RESIDUES
Dissipation and Phytotoxicity of Dicamba Residues in Water,
W74-02370 5B

Persistence of Endothall in Aquatic Environment as Determined by Gas-Liquid Chromatography,
W74-02381 5B

Isolation and Cleanup of Organophosphorus Insecticides and Their Oxones from Animal Tissues,
W74-02403 5A

Toxaphene Accumulation in Fish in Lakes Treated for Rough Fish Control,
W74-02425 5C

PESTICIDE TOXICITY
Dissipation and Phytotoxicity of Dicamba Residues in Water,
W74-02370 5B

Toxaphene Accumulation in Fish in Lakes Treated for Rough Fish Control,
W74-02425 5C

PETROLEUM HYDROCARBONS
Intercalibration of Analyses of Recently Biosynthesized Hydrocarbons and Petroleum Hydrocarbons in Marine Lipids,
W74-02390 5A

PHENOLOGY
The Phenology of Dragonflies in the Dehra Dun Valley, India,
W74-02237 2I

PHENOLS
Study of the Intracellular Water State in Plants Under the Effect of Phenols, (In Russian),
W74-02234 2I

The Determination of Phenols in Aqueous Effluents,
W74-02417 5A

Organic Desorption from Carbon-II. The Effect of Solvent in the Desorption of Phenol from Wet Carbon,
W74-02418 5A

Organic Desorption from Carbon-II. The Effect of Solvent in the Desorption of Phenol from Dry Carbon,
W74-02419 5A

PHOSPHATES
Reduction of BOD and Phosphate by Chemical Precipitation. Utilisation of Sludge,
W74-02267 5D

PHOSPHORUS
A Study of Factors Influencing the Nitrogen and Phosphorus Contents of Nebraska Waters,
W74-02151 5B

Effect of Feedlot Manure on Soil and Water Quality,
W74-02157 5B

An Ecological Evaluation of Stream Eutrophication,
W74-02201 5C

Experimental Studies on Phytoplankton Succession in Cayuga Lake,
W74-02217 5C

PHOSPHORUS

Contribution of Developed and Natural Marshland Soils to Surface and Subsurface Water Quality,
W74-02327 5B

Seasonal Changes in the Organic Forms of Carbon, Nitrogen and Phosphorus in Sea Water at El in the English Channel During 1968,
W74-02369 5B

Nitrogen, Phosphorus, and Trace Elements in Florida Surface Waters, 1970-71,
W74-02476 5A

PHOSPHOTHIOATE PESTICIDES
Isolation and Cleanup of Organophosphorus Insecticides and Their Oxones from Animal Tissues,
W74-02403 5A

PHOTODECOMPOSITION
Rates and Products of Decomposition of 2,2-Dibromo-3-Nitrilopropionamide,
W74-02382 5B

Picloram Photolytic Decomposition,
W74-02383 5B

Stability and Removal of Commercial Dyes from Process Wastewater,
W74-02429 5B

PHOTOGRAMMETRY
Floodplain Mapping and Planning for the 50 and 100 Year Interval Flood Zones of the Bitterroot Valley, Montana,
W74-02215 4A

PHOTOGRAPHY
Use of ERTS-1 in Coastal Studies,
W74-02633 2L

PHOTOLYSIS
Photolysis of Parathion (O,O-Diethyl-O- (4-Nitrophenyl) Thiophosphate). New Products,
W74-02380 5B

PHOTONUCLEAR ACTIVATION ANALYSIS
Determination of Trace Fluorine in Biological Materials by Photonuclear Activation Analysis,
W74-02361 5A

PHOTOSYNTHETIC PRODUCTIVITY
Comparative Productivity Studies of Three Mecklenburg Lakes (Lake Kummerow, Lake Teterow and Lake Malchin), (In German),
W74-02558 2H

PHREATOPHYTES
Evapotranspiration and Watershed Research as Related to Riparian and Phreatophyte Management--An Abstract Bibliography.
W74-02630 2D

PHYTOINDICATORS
Phytoindication of Saline Ground in Drying Up Shallow Lakes, (In Russian),
W74-02559 2H

PHYTOPLANKTON
Experimental Studies on Phytoplankton Succession in Cayuga Lake,
W74-02217 5C

PHYTOSOCIOLOGICAL STUDIES
Ecological and Phytosociological Study of a Sector in the Lybian Desert,
W74-02507 2I

PHYTOTOXICITY
Dissipation and Phytotoxicity of Dicamba Residues in Water,
W74-02370 5B

PICLORAM
Picloram Photolytic Decomposition,
W74-02383 5B

PIERS
Hydrologic Evaluations in Bridge Pier Scour Design,
W74-02309 8B

PIKE
Some Characteristics of Cesium-137 Accumulation in Populations of Freshwater Fish, (In Russian),
W74-02196 5C

PIMIENTO CANNERY
Characterization of Waste Effluents from a Commercial Pimento Canning Operation,
W74-02379 5A

PLANKTON
Complex Behaviour of Cobalt in the Danube River,
W74-02373 5B

Description, Distribution, and Ecology of the Rotifer and Crustacean Plankton Communities, Flathead Lake, Montana,
W74-02448 2H

PLANNING
Water and Sewerage Improvements Needed in 1975 in Chatham County, Georgia.
W74-02186 5D

Hydrologic and Watershed Modeling for Watershed Planning,
W74-02224 4D

Metropolitan Water and Sewer Plan, Lubbock Metropolitan Council of Governments.
W74-02331 3D

Tombigbee River Valley Water Management District, Tenth Annual Report.
W74-02332 6B

Regional Wastewater Facilities Study.
W74-02338 5D

The Balance of Surface Water Resources in the Lower Mesopotamian Valley,
W74-02350 6B

The Importance of Sediment Transport in Water Resources Planning,
W74-02351 4D

Evolving Water Policy and Management in the United States,
W74-02358 6B

State Water Plan, Proceedings of 18th Annual New Mexico Water Conference.
W74-02456 6B

PLANT COMMUNITIES
Plant Associations of the Southern Vercors Massive: Associations of Springs and Marshlands at Subalpine Elevation,
W74-02243 2I

PLANT COMMUNITY MAPPING
Use of the Sri Electronic Satellite Image Analysis Console for Mapping Southern Arizona Plant Communities from ERTS-1 Imagery,
W74-02593 7B

PLANT TISSUES
Study of the Intracellular Water State in Plants Under the Effect of Phenols, (In Russian),
W74-02234 2I

PLASMOLYSIS TIME
Study on the Plasmolysis Time in Epidermal Cells from Leaves of Saxifraga stolonifera Meerb (In Japanese),
W74-02542 2I

PLASTICS
Adsorption Characteristics of Silber, Lead, Cadmium, Zinc, and Nickel on Borosilicate Glass, Polyethylene, and Polypropylene Container Surfaces,
W74-02412 5A

PLAYAS
Dynamics of Playa Lakes in the Texas High Plains,
W74-02598 7B

PLUM ISLAND (MASS)
Detailed Analysis of Short-Term Variations in Beach Morphology (And Concurrent Dynamic Processes) for Summer and Winter Periods, 1971-1972, Plum Island, Massachusetts,
W74-02649 2E

POLAND
The Effect of Organic Substrates on the Abundance of Bacteria in the Water of 5 Masurian Lakes,
W74-02556 5C

POLAND (RABA RIVER VALLEY)
Cleanliness of Wells, Chemical Substances in Drinking Water and Their Relation to Caries (In Polish),
W74-02544 5C

POLE MOUNTAIN (WYO)

RESINS
Removal of Organic Matter from Water by Resinous Adsorbents,
W74-02266 5D

RETAINING WALLS
Annual Compilation and Analysis of Hydrologic Data for Green Creek, Brazos River Basin, Texas, 1971,
W74-02626 4D

REVERSE OSMOSIS
Purification of Effluents by Means of Reverse Osmosis, (Ochistka stochnykh vod metodom obratnogo osmosa),
W74-02258 5D

Ion Exchange and Allied Processes in Water Recovery,
W74-02268 5D

Hyperfiltration (Reverse Osmosis) of Kraft Pulp Mill and Bleach Plant Wastes,
W74-02285 5D

Improving Reverse Osmosis Performance with Dynamically Formed Wood Chemical Membranes,
W74-02286 5D

REVIEWS
Survey of Methods of Treating Wine and Grape Waste Water,
W74-02329 5D

Water Quality Characteristics of Storm Sewer Discharges and Combined Sewer Overflows,
W74-02345 5B

Current Status of the Environmental and Human Safety Aspects of Nitrilotriacetic Acid (NTA),
W74-02394 5B

Report by the National Water Commission--A Review,
W74-02463 6B

On the Concept and Determination of Critical Soil Moisture,
W74-02546 2G

Antarctic Limnology: A Review,
W74-02552 2C

RICE
Factors Affecting the Manganese Status in Soils of the U.A.R.,
W74-02200 2G

Determination of Trace Fluorine in Biological Materials by Photonuclear Activation Analysis,
W74-02361 5A

RIO GRANDE REGION
A Conjunctive use Surface Water-Ground Water Simulator,
W74-02452 2F

RIPARIAN WATER LOSS
Evapotranspiration and Watershed Research as Related to Riparian and Phreatophyte Management--An Abstract Bibliography.
W74-02630 2D

RISKS
A Bayesian Decision Framework for Synthetic Hydrology,
W74-02438 6A

RIVER BASIN DEVELOPMENT
River Basin Monetary Authorizations--Disaster Relief Act Amendments.
W74-02516 6E

A Bill to Authorize the Secretary of the Interior to Construct, Operate, and Maintain the Pollock-Herreid Unit, South Dakota Pumping Division, Missouri River Basin Project, South Dakota.
W74-02529 6E

RIVER BASINS
Water-Balance Method and Its Practical Importance, (Metod vodnogo balansa i yego prakticheskoye znacheniye),
W74-02308 2A

A Bill to Authorize the Secretary of the Interior to Construct, Operate, and Maintain the Pollock-Herreid Unit, South Dakota Pumping Division, Missouri River Basin Project, South Dakota.
W74-02529 6E

Flood Control Project Maintenance and Repair--1970 Inspection Report,
W74-02617 2E

RIVER FLOW
Ultrasonic River Flow Measurement,
W74-02250 2E

RIVERS AND HARBORS ACT
In RE Chinese Maritime Trust, Ltd., (Wreck Obstructing Navigable Waters of the Panama Canal).
W74-02513 6E

ROACH
Some Characteristics of Cesium-137 Accumulation in Populations of Freshwater Fish, (In Russian),
W74-02196 5C

ROMANIA
Considerations Concerning the Biology and Distribution Area of the Cyprinid Fish Pseudorasbora parva (Schlegel) in the Romanian Waters,
W74-02553 2I

ROOKERY BAY SANCTUARY (FLA)
Applicability of the Interceptor Waterway Concept to the Rookery Bay Sanctuary,
W74-02205 4A

ROOTS
The Action of Abscisic Acid on Ion Uptake and Water Flow in Plant Roots,
W74-02260 3F

ROTATIONAL FLOW
Analysis of Internal Flow Characteristics of a Smooth-Disk Water-Brake Dynamometer,
W74-02475 8C

ROTIFERA
Some Further Results of the Zooplankton Studies in the Czechslovak-Hungarian Stretch of the Danube,
W74-02545 2I

ROTIFERS
Description, Distribution, and Ecology of the Rotifer and Crustacean Plankton Communities, Flathead Lake, Montana,
W74-02448 2H

RUNOFF
The Water Balance of New Zealand,
W74-02291 2A

RURAL AREA
A Water and Sewer Plan: Greene County, Georgia.
W74-02334 5D

RURAL AREAS
A Water and Sewer Plan: Morgan County, Georgia.
W74-02335 5D

A Water and Sewer Plan: Madison County, Georgia.
W74-02336 5D

A Water and Sewer Plan: Walton County, Georgia.
W74-02337 5D

SACRAMENTO AND SAN JOAQUIN VALLEYS (CALIF.)
Flood Control Project Maintenance and Repair--1970 Inspection Report,
W74-02617 2E

SALINE SOILS
Migration of Substances with Surface and Gravitational Waters in Soils of Geochemically Related Landscapes of Baraba, (Migratsiya veshchestv s pverkhnostnymi i gravitatsionnymi vodami v pochvakh geokhimicheski sopryazhennykh landshaftov Baraby),
W74-02300 2G

SALINE WATER
The Use of Desalted Seawater for Intensive Agricultural Applications, (El Uso de Agua de Mar Desalada Para Intensivas Aplicaciones Agricolas),
W74-02359 3A

SALINE WATER INTRUSION
Water Quality Management in Groundwater Basins,
W74-02356 5B

SALINITY
On the Relation Between the Occurrence of Desmids and the Salinity in the Hokuriku District of Japan, (In Japanese).
W74-02191 5B

Salinity Corrections for Dissolved Oxygen Measurements,
W74-02424 5A

Water Resources Development in the Mullica River Basin,
W74-02450 5C

On the Characteristics of Salt Intrusion in the Kitakami River, Miyagi Prefecture (In Japanese),
W74-02541 5B

Phytoindication of Saline Ground in Drying Up Shallow Lakes, (In Russian),
W74-02559 2H

SALINITY DISTRIBUTION
On the Variation of Salinity Distribution in a Reservoir, Situated in Reclaimed Land, (Japanese),
W74-02246 2H

SALMON
The Hydrology of Ten Streams in Western Washington as Related to the Propagation of Several Pacific Salmon Species,
W74-02297 8I

SALMON SPAWNING
The Hydrology of Ten Streams in Western Washington as Related to the Propagation of Several Pacific Salmon Species,
W74-02297 8I

SALT WATER INTRUSION
On the Characteristics of Salt Intrusion in the Kitakami River, Miyagi Prefecture (In Japanese),
W74-02541 5B

SALTS
Salt, a Little-Known Aggressor in Our Environment, (In French),
W74-02199 5B

Migration of Substances with Surface and Gravitational Waters in Soils of Geochemically Related Landscapes of Baraba, (Migratsiya veshchestv s pverkhnostnymi i gravitatsionnymi vodami v pochvakh geokhimicheski sopryazhennykh landshaftov Baraby),
W74-02300 2G

SAMPLE INJECTION
Sampling Techniques in Chromatography,
W74-02372 7B

SAMPLE PREPARATION
Application of Activated Carbon for the Enrichment of Trace Elements and Their Determination by Atomic Absorption Spectrometry, (Uber die Verwendung von Aktivkohle zur Anreicherung von Spurenelementen mit nachfolgender Bestim mung durch Atomabsorptions-Spektrometrie,
W74-02433 5A

SAMPLING
Sampling Techniques in Chromatography,
W74-02372 7B

An Improved Bottom-Water Sampler,
W74-02410 7B

Comparative Productivity Studies of Three Mecklenburg Lakes (Lake Kummerow, Lake Teterow and Lake Malchin), (In German),
W74-02558 2H

SAN ANTONIO RIVER BASIN (TEX)
Annual Compilation and Analysis of Hydrologic Data for Calaveras and Escondido Creeks, San Antonio River Basin, Texas, 1971,
W74-02478 2E

SAN FRANCISCO AREA (CALIF)
Fate of Petroleum Hydrocarbons In Beach Sand,
W74-02473 5B

SAND SINK METHOD
Feasibility Study of the Sand Sinking Method of Combatting a Major Oil Spill in the Ocean Environment,
W74-02635 5G

SANDS
A Self-Draining Subsurface Rainfall Conservation System: Its Effect on the Soil Water Status and Productivity of Coastal Plains Sands,
W74-02193 2G

Fate of Petroleum Hydrocarbons In Beach Sand,
W74-02473 5B

SAPROCHAETE-SACCHAROPHYLA
Occurrence of Saprochaete saccharophyla Coker Et Shanor in Fungoid Growth below the Discharge of Breweries, (In Czech),
W74-02242 5B

SATELLITE (ARTIFICIAL)
New Aspects on the Tectonic of the Alps and the Apennines Revealed by ERTS-1 Data,
W74-02564 7B

SATELLITES (ARTIFICAL)
Application and Consequences of Precipitation Observations in the Republic of Sudan in View of the Nomadic Life and Economy,
W74-02348 2B

SATELLITES (ARTIFICIAL)
ERTS-1 Image Contributes to Understanding of Geologic Structures Related to Managua Earthquake, 1972,
W74-02561 7B

Recognition of Surface Lithologic and Topographic Patterns in Southwest Colorado with ADP Techniques,
W74-02562 7B

ERTS-1 Imagery as an Aid to the Definition of the Geotectonic Domains of the Southern African Crystalline Shield,
W74-02563 7B

Structural Lineaments of Gaspe from ERTS Imagery,
W74-02565 7B

Lineaments in Coastal Plain Sediments as Seen in ERTS Imagery,
W74-02566 7B

Evaluation of Commercial Utility of ERTS-A Imagery in Structural Reconnaissance for Minerals and Petroleum,
W74-02567 7B

Structural Interpretations Based on ERTS-1 Imagery, Bighorn Region, Wyoming-Montana,
W74-02568 7B

Applicability of ERTS-1 to Lineament and Photogeologic Mapping in Montana--Preliminary Report,
W74-02569 7B

A New Fault Lineament in Southern California,
W74-02570 7B

Fracture Mapping and Strip Mine Inventory in the Midwest by Using ERTS-1 Imagery,
W74-02571 7B

ERTS-1 Investigation of Ecological Effects of Strip Mining in Eastern Ohio,
W74-02572 7B

The Use of ERTS-1 MSS Data for Mapping Strip Mines and Acid Mine Drainage in Pennsylvania,
W74-02573 7B

Monitoring Vegetation Cover on Mine Dumps with ERTS-1 Imagery: Some Initial Results,
W74-02574 7B

Remote Detection of Aerosol Pollution by ERTS,
W74-02575 7B

Detection, Mapping and Estimation of Rate Spread of Grass Fires from Southern African ERTS-1 Imagery,
W74-02576 7B

Mapping Atlantic Coastal Marshlands, Maryland, Georgia, Using ERTS-1 Imagery,
W74-02577 7B

Identification of Marsh Vegetation and Coastal Land Use in ERTS-1 Imagery,
W74-02578 7B

Application of ERTS-1 Data to the Protection and Management of New Jersey's Coastal Environment,
W74-02579 7B

Monitoring Ocean Dumping with ERTS-1 Data,
W74-02580 7B

Environmental Study of ERTS-1 Imagery: Lake Champlain and Vermont,
W74-02581 7B

Water Turbidity Detection Using ERTS-1 Imagery,
W74-02582 7B

Digital Analysis of Potomac River Basin ERTS Imagery: Sedimentation Levels at the Potomac-Anacostia Confluence and Strip Mining in Allegheny County, Maryland,
W74-02583 7B

A Study on the Erosion of Niigata Beach from ERTS-A Imagery,
W74-02584 7B

Application of ERTS Data to the Detection of Thin Cirrus and Clear Air Turbulence,
W74-02585 7B

Polluted and Turbid Water Masses in Osaka Bay and Its Vicinity Revealed with ERTS-A Imageries,
W74-02586 7B

Red Tide in Ise Bay,
W74-02587 7B

Hydrogeology of Closed Basins and Deserts of South America, ERTS-1 Interpretations,
W74-02588 7B

Detection of Major River Bed Changes in the River Ebro (North-Eastern Spain),
W74-02589 7B

Applications of Multispectral Imagery to Water Resources Development Planning in the Lower Mekong Basin (Khemer Republic, Laos, Thailand and Viet-Nam),
W74-02590 7B

Application of ERTS-1 Imagery to Flood Inundation Mapping,
W74-02591 7B

Assessment of Flood Damage in Arizona by Means of ERTS-1 Imagery,
W74-02592 7B

Use of the Sri Electronic Satellite Image Analysis Console for Mapping Southern Arizona Plant Communities from ERTS-1 Imagery,
W74-02593 7B

Monitoring of Streamflow in the Verde River by ERTS-1 Data Collection System (DCS),
W74-02594 7B

Preliminary Analysis of ERTS-Relayed Water-Resources Data in the Delaware River Basin,
W74-02595 7B

An Evaluation of Space Acquired Data as a Tool for Management of Wildlife Habitat in Alaska,
W74-02596 7B

Preliminary Evaluation of ERTS-1 for Determining Numbers and Distribution of Prairie Ponds and Lakes,
W74-02597 7B

Dynamics of Playa Lakes in the Texas High Plains,
W74-02598 7B

Studies in the Lake Ontario Basin Using ERTS-1 and High Altitude Data,
W74-02599 7B

Progress of an ERTS-1 Program for Lake Ontario and its Basin,
W74-02600 7B

Remote Sensing of Turbidity Plumes in Lake Ontario,
W74-02601 7B

ERTS-1 Views the Great Lakes,
W74-02602 7B

Use of ERTS Data for Mapping Snow Cover in the Western United States,
W74-02603 7B

Evaluation of ERTS Imagery for Mapping and Detection of Changes of Snowcover on Land and on Glaciers,
W74-02604 7B

Use of ERTS-1 in Coastal Studies,
W74-02633 2L

SATURATED FLOW

Ground Water Seepage Patterns to Wells for Unconfined Flow--Phase II,
W74-02206 2F

Saturated-Unsaturated Seepage by Finite Elements,
W74-02313 2G

SATURATED SOILS

Experimental and Predicted Movement of Three Herbicides in a Water-Saturated Soil,
W74-02156 5B

A Study of Items in the Groundwater Balance of Waterlogged Areas (Ob uzuchenii elementov balansa gruntovykh vod no zabolochennykh uchastkakh),
W74-02610 2D

SAVANNAH (GEO)

Water and Sewerage Improvements Needed in 1975 in Chatham County, Georgia.
W74-02186 5D

SAWTOOTH RANGE (MONT)

The Role of Deformation in Changing the Reservoir Properties of Aquifers,
W74-02446 2F

SAXIFRAGA-STOLONIFERA

Study on the Plasmolysis Time in Epidermal Cells from Leaves of Saxifraga stolonifera Meerb (In Japanese),
W74-02542 2I

SCIOTO RIVER BASIN (OHIO)

Strontium, Calcium and the Isotopic Composition of Strontium in Underground Waters from the Scioto River Basin, Ohio,
W74-02218 2F

SCOTLAND (HOLY LOCH)

Dispersion in Flow from a Continuous Source at Sea,
W74-02163 5B

SCOUR

Hydrologic Evaluations in Bridge Pier Scour Design,
W74-02309 8B

Bed Scour at End-Dump Channel Constrictions,
W74-02316 8B

Sedimentation and Scour Off Nuclear Power Plants,
W74-02645 2J

SEA-FOAM MASSES

Persistent Sea-Foam Masses -- A Problem Solved,
W74-02180 5B

SEA WATER

Power, Fresh Water, and Food From Cold, Deep Sea Water,
W74-02254 3B

Seasonal Changes in the Organic Forms of Carbon, Nitrogen and Phosphorus in Sea Water at El in the English Channel During 1968,
W74-02369 5B

Accumulation of Fossil CO2 in the Atmosphere and the Sea,
W74-02375 5C

A Modified Extraction Method for Determination of Mineral Oil in Sea Water,
W74-02388 5A

SEASONAL

Seasonal Changes in the Organic Forms of Carbon, Nitrogen and Phosphorus in Sea Water at El in the English Channel During 1968,
W74-02369 5B

Thermal Regime of the Lower Reaches of the Danube River in Autumn and Winter,
W74-02605 2C

SEAWATER

Hanging Mercury Drop Electrodeposition Technique for Carbon Filament Flameless Atomic Absorption Analysis. Application to the Determination of Copper in Sea Water,
W74-02411 2K

An Automated Analysis for Urea in Seawater,
W74-02421 5A

Detection and Estimation of Isopropyl Methylphosphonofluoridate and O-Ethyl S-Diisopropylaminoethylmethylphosphonothioate in Seawater in Parts-Per-Trillion Level,
W74-02427 5A

SEDIMENT CONTROL

Prescribed Fire Effects on Water Repellency, Infiltration and Retention in Mixed-Conifer Litter, Duff and Soil,
W74-02442 4C

SEDIMENT TRANSPORT

A New Oscillating Water Tunnel,
W74-02160 2J

The Importance of Sediment Transport in Water Resources Planning,
W74-02351 4D

Research in the Coastal and Oceanic Environment,
W74-02481 2L

Bulletin and Summary of Research Progress Fiscal Years 1970-71.
W74-02647 2L

Detailed Analysis of Short-Term Variations in Beach Morphology (And Concurrent Dynamic Processes) for Summer and Winter Periods, 1971-1972, Plum Island, Massachusetts,
W74-02649 2E

SEDIMENTATION

The Importance of Sediment Transport in Water Resources Planning,
W74-02351 4D

SEDIMENTATION RATES

Bolinas Lagoon, Marin County, California, Summary of Sedimentation and Hydrology, 1967-69,
W74-02296 2L

SEDIMENTOLOGY

Investigation of Fall Velocity of Sediments in Mountain Streams, (Issledovaniye

gidravlicheskoy krupnosti nanosov gornykh rek),
W74-02306 2J

SEDIMENTS
The Distribution of Trace Metals and Fauna in the Firth of Clyde in Relation to the Disposal of Sewage Sludge,
W74-02420 5B

SEEDLING CROPS
Dissipation and Phytotoxicity of Dicamba Residues in Water,
W74-02370 5B

SEEPAGE
Saturated-Unsaturated Seepage by Finite Elements,
W74-02313 2G

Studies on Seepage from Canals with Partial Lining,
W74-02319 4A

SEICHES
Long Waves in Shallow Triangular Channels,
W74-02158 2E

Adjustment of Friction in Hydraulic Models of Lakes,
W74-02314 2H

SELECTIVITY
Enhancement of the Sensitivity and Selectivity of the Coulson Electrolytic Conductivity Detector to Chlorinated Hydrocarbon Pesticides,
W74-02413 5A

SENSITIVITY
Enhancement of the Sensitivity and Selectivity of the Coulson Electrolytic Conductivity Detector to Chlorinated Hydrocarbon Pesticides,
W74-02413 5A

SENSORS
System for Monitoring Contaminants in Liquids,
W74-02493 5A

SEPARATION TECHNIQUES
Use of Sephadex Gel for the Fractionation of Organic Matter in Lake Water, (In Russian),
W74-02343 5A

Separation and Identification of Metal Dithizonates by Thin-Layer Chromatography and its Application in Toxicological Analysis,
W74-02360 5A

Extraction and Spectrophotometric Determination of Vanadium as a Mixed Ligand Complex of Oxine and Azide,
W74-02362 5A

Extraction of Boric Acid with Aliphatic 1,3-Diols and Other Chelating Agents,
W74-02368 5A

Analyzing Heavy Ends of Crude,
W74-02378 5A

A Modified Extraction Method for Determination of Mineral Oil in Sea Water,
W74-02388 5A

The Use and Effect of Mixed Standards on the Quantitation of Polychlorinated Biphenyls,
W74-02393 5A

Ion-Exchange Separations on Mixed Columns,
W74-02398 5A

Enhancement of the Sensitivity and Selectivity of the Coulson Electrolytic Conductivity Detector to Chlorinated Hydrocarbon Pesticides,
W74-02413 5A

High Precision Sampling for Chromatographic Separations,
W74-02414 2K

The Determination of Phenols in Aqueous Effluents,
W74-02417 5A

Organic Desorption from Carbon-II. The Effect of Solvent in the Desorption of Phenol from Wet Carbon,
W74-02418 5A

Organic Desorption from Carbon-II. The Effect of Solvent in the Desorption of Phenol from Dry Carbon,
W74-02419 5A

Potentiality of the Coupling of Column Liquid Chromatography and Field Desorption Mass Spectrometry,
W74-02430 2K

Separation and Gas-Chromatographic Determination of Traces of Fluoride, (Abtrennung und gas-chromatographische Bestimmung von Fluoridspuren),
W74-02431 5A

Anionic Exchange Separations of the Elements that can be Extracted with Tributyl Phosphate. II, (Anionenaustauschtrennungen der mit Tributylphosphat extrahierbaren Elemente. II),
W74-02432 2K

Determination of Small Amounts of Uranium After Concentrating Through Extraction and Anionic Exchange in a Solvent Agent System Containing Tri-N-Octylphosphine Oxide. (Bestimmung geringer Uranmengen nach Konzentrierun g durch Extraktion und Anionenaustausch in einem tri-n-octylphoshinoxidhaltigen Losungsmittelsystem),
W74-02434 5A

Apparatus for Confining Floating Pollutants,
W74-02488 5G

Underwater Tanker Ballast Water/Oil Separation,
W74-02492 5G

Electrochemical Flotation Concept for Removing Oil from Water,
W74-02634 5D

Feasibility Study of the Sand Sinking Method of Combatting a Major Oil Spill in the Ocean Environment,
W74-02635 5G

SEPHADEX GEL FILTRATION
Use of Sephadex Gel for the Fractionation of Organic Matter in Lake Water, (In Russian),
W74-02343 5A

SETTLING VELOCITY
Investigation of Fall Velocity of Sediments in Mountain Streams, (Issledovaniye gidravlicheskoy krupnosti nanosov gornykh rek),
W74-02306 2J

SEWAGE
The Growth of Chlorella vulgaris in Sewage and Acid Mine Water,
W74-02169 5C

Occurrence of Hexachlorophene and Pentachlorophenol in Sewage and Water,
W74-02426 5A

United States V. Lindsay (Government's Action Against City for Alleged Violation of Refuse Act and New York Harbor Act, and for Creation of Public Nuisance).
W74-02526 6E

SEWAGE DISPOSAL
Fourth Annual Report, City of Carbondale, Illinois, Water and Wastewater Treatment.
W74-02328 5D

United States V. Lindsay (Government's Action Against City for Alleged Violation of Refuse Act and New York Harbor Act, and for Creation of Public Nuisance).
W74-02526 6E

SEWAGE EFFLUENTS
Water Recycling of Sewage Effluent by Irrigation: A Field Study on Oahu,
W74-02631 2B

SEWAGE SYSTEMS
Regional Water, Sewage, and Solid Waste Districts.

SEWAGE TREATMENT
The Use of Power Plant Heat in a Physical-Chemical Domestic Wastewater Renovation System,
W74-02208 5D

Removal of Organic Material by Adsorption on Activated Carbon,
W74-02264 5D

In-Pipe Wastewater Cleanup.
W74-02269 5D

Advanced Treatment of Purified Sewage for Production of High-Brightness Pulp and Paper,
W74-02280 5D

Fourth Annual Report, City of Carbondale, Illinois, Water and Wastewater Treatment.
W74-02328 5D

Chlorination Effects on Organic Constituents in Effluents from Domestic Sanitary Sewage Treatment Plants,
W74-02416 5C

Impact of Sewage Treatment Modifications on Water Quality of a Reservoir,
W74-02483 5D

Method and Apparatus for Electrolytic Treatment of Sewage,
W74-02486 5D

Sewage Treatment Apparatus,
W74-02489 5D

SEWERAGE
Water and Sewerage Improvements Needed in 1975 in Chatham County, Georgia.
W74-02186 5D

City of Austin, Texas, Study of Wastewater Collection System: Phase I.
W74-02330 5D

Metropolitan Water and Sewer Plan, Lubbock Metropolitan Council of Governments.
W74-02331 3D

A Water and Sewer Plan: Greene County, Georgia.
W74-02334 5D

A Water and Sewer Plan: Morgan County, Georgia.
W74-02335 5D

A Water and Sewer Plan: Madison County, Georgia.
W74-02336 5D

A Water and Sewer Plan: Walton County, Georgia.
W74-02337 5D

Northeast Georgia Area Water and Sewer Systems Plan and Capital Improvement Program.
W74-02339 3D

SEWERS
City of Austin, Texas, Study of Wastewater Collection System: Phase I.
W74-02330 5D

SHALLOW WATER
Two-Dimensional Waves Generated by a Surface Pressure Disturbance Over a Sloping Beach,
W74-02187 2E

Use of ERTS-1 in Coastal Studies,
W74-02633 2L

Wave Breaking in Shallow Water,
W74-02638 2L

Design Considerations for a 3-D Laser Doppler Velocimeter for Studying Gravity Waves in Shallow Water,
W74-02642 2L

Detailed Analysis of Short-Term Variations in Beach Morphology (And Concurrent Dynamic Processes) for Summer and Winter Periods, 1971-1972, Plum Island, Massachusetts,
W74-02649 2E

SHEAR STRESS
A Shear Plate for Use in Oscillatory Flow,
W74-02161 2E

SHELTERBELTS
Moisture Regime of Southern Chernozem Within Shelterbelts, (Rezhim vlazhnosti yuzhnogo chernozema v sisteme lesnykh polos),
W74-02302 2G

SHORE PROTECTION
Approaches to State Coastal Management,
W74-02185 2L

Bulletin and Summary of Research Progress Fiscal Years 1970-71.
W74-02647 2L

SILICA
Occurrence of Silica in the Natural Waters of the Huntley-Robertson District, Southern New South Wales,
W74-02555 2K

SILTING
Determination of the Mechanical Compatibility of Porous Rocks with Waste Water in its Subsurface Disposal,
W74-02165 5B

SIMAZINE
Influence of Herbicides on Microbiological Conditions,
W74-02548 5B

SIMULATION ANALYSIS
Two Environmental Analyses Involving Agriculture,
W74-02166 5B

Computer Simulation of Trophic Level Interrelationships in Cayuga Lake,
W74-02216 5C

Hydrologic and Watershed Modeling for Watershed Planning,
W74-02224 4D

Hydrologic Simulation Model of Colorado Subalpine Forest,
W74-02248 7B

Computer Simulation of Storm Water Runoff,
W74-02310 2E

Dam-Break Flood in a Prismatic Dry Channel,
W74-02311 8B

Development of Models for Analyzing Water Resources Development and Use Within a Regional Framework,
W74-02455 6A

SIOUX FALLS (S DAK)
Water Resources of the Big Sioux River Valley Near Sioux Falls, South Dakota,
W74-02619 2E

SKIMMING
Oil Skimming Apparatus,
W74-02491 5G

Water Pollution Control,
W74-02495 5G

SKOKOMISH INDIAN RESERVATION (WASH)
Water Resources of the Skokomish Indian Reservation, Washington,
W74-02623 2G

SLOPES
Slope Aspect and Tunnel Erosion in the Loess of Banks Peninsula, New Zealand,
W74-02288 2J

SLUDGE DISPOSAL
Dry Activated Sludge as Fertilizer for Winter Wheat and Corn, (Sukhoi aktivnyi il kak udobrenie dlya posevov ozimi pshenits' i kukuruz'),
W74-02270 5D

Pulp and Paper Mill Sludge Utilization and Disposal,
W74-02278 5D

The Distribution of Trace Metals and Fauna in the Firth of Clyde in Relation to the Disposal of Sewage Sludge,
W74-02420 5B

SLUDGE TREATMENT
Mathematical Relationships of BOD Removal in Activated Sludge Process,
W74-02176 5D

Waste Water Research for the Pulp and Paper Industry at the Darmstadt Technological Institute (Abwasserforschung fuer die Papier-und Zellstoffindustrie an der TH Darmstadt),
W74-02257 5D

Reduction of BOD and Phosphate by Chemical Precipitation. Utilisation of Sludge,
W74-02267 5D

Pulp and Paper Mill Sludge Utilization and Disposal,
W74-02278 5D

Bacterial Protein from Paper Mill Sludges,
W74-02282 5E

Water-Treatment-Sludge Filtration Studies,
W74-02440 5D

SMALL WATERSHEDS
Two Environmental Analyses Involving Agriculture,
W74-02166 5B

Calibrating A Water Yield Model for Small Ungaged Watersheds,
W74-02172 2A

The Ex Post Measurement of Benefits and Costs in Small Watershed Projects,
W74-02212 6B

Annual Compilation and Analysis of Hydrologic Data for Little Elm Creek, Trinity River Basin, Texas, 1971,
W74-02477 2E

Annual Compilation and Analysis of Hydrologic Data for Calaveras and Escondido Creeks, San Antonio River Basin, Texas, 1971,
W74-02478 2E

SNAILS
Attempt at Mollusk Control by Increasing the Planktonic Biomass and by Molluscicidal Treatment: The Urea-N-Tritylmorpholine Association (In French),
W74-02226 5C

SNAKE RIVER FAN (IDAHO)
Systems Analysis of Irrigation Water Management in Eastern Idaho,
W74-02322 4B

SNOW
Experience in a Quantitative Assessment of Organization of Snow Cover as a Natural System (Opyt kolichestvennoy otsenki organizatsii snezhnogo pokrova kak prirodnoy sistemy),
W74-02613 2C

SNOW COVER
Use of ERTS Data for Mapping Snow Cover in the Western United States,
W74-02603 7B

Evaluation of ERTS Imagery for Mapping and Detection of Changes of Snowcover on Land and on Glaciers,
W74-02604 7B

Experience in a Quantitative Assessment of Organization of Snow Cover as a Natural System (Opyt kolichestvennoy otsenki organizatsii snezhnogo pokrova kak prirodnoy sistemy),
W74-02613 2C

SNOW FENCES
Evaporation from Snowdrifts Under Oasis Conditions,
W74-02183 2D

SNOW MANAGEMENT
Measuring Snowfall, A Critical Factor for Snow Resource Management,
W74-02184 2C

SNOW MECHANICS
Hyperbolic Stress Equations for Compressible Slabs,
W74-02624 2C

SNOW SURVEYS
Use of ERTS Data for Mapping Snow Cover in the Western United States,
W74-02603 7B

SNOWFALL
Measuring Snowfall, A Critical Factor for Snow Resource Management,
W74-02184 2C

SNOWPACKS
Evaporation from Snowdrifts Under Oasis Conditions,
W74-02183 2D

Evaluation of ERTS Imagery for Mapping and Detection of Changes of Snowcover on Land and on Glaciers,
W74-02604 7B

Hyperbolic Stress Equations for Compressible Slabs,
W74-02624 2C

SODIUM COMPOUNDS
Sodium Recovery from a Pulp Mill Waste Effluent by Ion Exchange,
W74-02259 5D

SOIL ANALYSIS
Determination of Trace Fluorine in Biological Materials by Photonuclear Activation Analysis,
W74-02361 5A

SOIL CHEMICAL PROPERTIES
Factors Affecting the Manganese Status in Soils of the U.A.R.,
W74-02200 2G

SOIL CONSERVATION
Soil and Water Conservation Districts.
W74-02537 6E

SOIL CONTAMINATION
Chlorodioxins in Pesticides, Soils, and Plants,
W74-02371 5B

SOIL CONTAMINATION EFFECTS
Current Status of the Environmental and Human Safety Aspects of Nitrilotriacetic Acid (NTA),
W74-02394 5B

SOIL DISPOSAL FIELDS
Dry Activated Sludge as Fertilizer for Winter Wheat and Corn, (Sukhoi aktivnyi il kak udobrenie dlya posevov ozimi pshenits' i kukuruz'),
W74-02270 5D

SOIL EROSION
Storm Rainfall in the Black Sea Region as a Factor in Soil Erosion,
W74-02607 2B

SOIL MOISTURE
Influence of Soil Structure and Moisture on Nitrification,
W74-02192 2G

Water Regime of Solonchak Solonetzes in Open Areas of Forests in the North Caspian Sea Region, (Vodnyy rezhim solonchakovykh solontsov na polyanakh lesnykh nasazhdeniy Severnogo Prikaspiya),
W74-02301 2G

Moisture Regime of Southern Chernozem Within Shelterbelts, (Rezhim vlazhnosti yuzhnogo chernozema v sisteme lesnykh polos),
W74-02302 2G

An Airborne Gamma Survey of Moisture Content in the Surface Detention Layer, (Samoletnaya gamma-s'yemka zapasov vlagi v sloye poverkhnostnogo zaderzhaniya),
W74-02307 2G

Effect of Excess Soil Moisture on Yield and Biochemical Processes in Spring Wheat at Various Stages of Its Development (In Russian),
W74-02325 3F

Evaluation of Soil Moisture Regime in a Watershed,
W74-02355 2G

On Solving the Unsaturated Flow Equation: The Flux-Concentration Relation,
W74-02464 2G

On the Concept and Determination of Critical Soil Moisture,
W74-02546 2G

The Effect of Soil Moisture Upon the Availability of Potassium and its Influence on the Growth of Young Maize Plants (Zea mays L.),
W74-02554 3F

SOIL MOISTURE METERS
Evaluation of Soil Moisture Regime in a Watershed,
W74-02355 2G

SOIL PHYSICS
Investigation of the Relation Between Moisture Potential and 'Reduced Film Thickness' for Disperse Systems with Nonporous Particles, (Issledovaniye zavisimosti mezhdu potentsialom vlazhnosti i 'privedennoy tolshchincy plenki' dlya di spersnykh sistem s neporistymi chastitsami),
W74-02304 2G

SOIL STRUCTURE
Influence of Soil Structure and Moisture on Nitrification,
W74-02192 2G

SOIL SURVEYS
General Soils Study: Pearl River, Hancock, Harrison Counties, Mississippi.
W74-02333 2G

SOIL WATER
Influence of the Soil Water Level on Microbial Processes of Pasture and Forest Communities,
W74-02194 2G

SOIL WATER MOVEMENT
Experimental and Predicted Movement of Three Herbicides in a Water-Saturated Soil,
W74-02156 5B

Moisture Regime of Southern Chernozem Within Shelterbelts, (Rezhim vlazhnosti yuzhnogo chernozema v sisteme lesnykh polos),
W74-02302 2G

On Solving the Unsaturated Flow Equation: The Flux-Concentration Relation,
W74-02464 2G

SOIL-WATER-PLANT RELATIONSHIPS
Water Regime of Solonchak Solonetzes in Open Areas of Forests in the North Caspian Sea Region, (Vodnyy rezhim solonchakovykh solontsov na polyanakh lesnykh nasazhdeniy Severnogo Prikaspiya),
W74-02301 2G

SOLAR RADIATION
Power, Fresh Water, and Food From Cold, Deep Sea Water,
W74-02254 3B

SOLID WASTES
Regional Water, Sewage, and Solid Waste Districts.
W74-02535 5D

SOLONCHAKS
Water Regime of Solonchak Solonetzes in Open Areas of Forests in the North Caspian Sea Region, (Vodnyy rezhim solonchakovykh solontsov na polyanakh lesnykh nasazhdeniy Severnogo Prikaspiya),
W74-02301 2G

SOLONETZES
Water Regime of Solonchak Solonetzes in Open Areas of Forests in the North Caspian Sea Region, (Vodnyy rezhim solonchakovykh solontsov na polyanakh lesnykh nasazhdeniy Severnogo Prikaspiya),
W74-02301 2G

SOLUTES
Analysis by Means of Gas Bubble Electrification,
W74-02406 2K

SOLVENT EXTRACTIONS
Extraction of Boric Acid with Aliphatic 1,3-Diols and Other Chelating Agents,
W74-02368 5A

SOLVENT SYSTEMS
Determination of Small Amounts of Uranium After Concentrating Through Extraction and Anionic Exchange in a Solvent Agent System Containing Tri-N-Octylphosphine Oxide. (Bestimmung geringer Uranmengen nach Konzentrierun g durch Extraktion und Anionenaustausch in einem tri-n-octylphoshinoxidhaltigen Losungsmittelsystem),
W74-02434 5A

SORBENTS
Investigation of Sorbents for Removing Oil Spills from Waters,
W74-02636 5G

SOUNDS
Seasonal and Areal Distribution and Abundance of the Copepoda in a Mississippi Estuarine System,
W74-02637 2L

Puget Sound Resident Coho Salmon Study,
W74-02639 2L

Development of a Mathematical Model to Predict the Occurrence of Cynoscion arenarius in Mississippi Estuaries,
W74-02640 2L

SOUTH AFRICA
Optimum Design Period for Water Pollution Control Plants,
W74-02222 5D

Advanced Treatment of Purified Sewage for Production of High-Brightness Pulp and Paper,
W74-02280 5D

ERTS-1 Imagery as an Aid to the Definition of the Geotectonic Domains of the Southern African Crystalline Shield,
W74-02563 7B

Monitoring Vegetation Cover on Mine Dumps with ERTS-1 Imagery: Some Initial Results,
W74-02574 7B

SOUTH DAKOTA
Plant Nutrient Concentrations in Runoff from Fertilized Cultivated Erosion Plots and Prairie in Eastern South Dakota,
W74-02154 5B

Mercury in Fish, Sediments, and Water in Lake Oahe, South Dakota,
W74-02423 5A

A Bill to Authorize the Secretary of the Interior to Construct, Operate, and Maintain the Pollock-Herreid Unit, South Dakota Pumping Division, Missouri River Basin Project, South Dakota.
W74-02529 6E

Water Resources of the Big Sioux River Valley Near Sioux Falls, South Dakota,
W74-02619 2E

SPAWNING
The Hydrology of Ten Streams in Western Washington as Related to the Propagation of Several Pacific Salmon Species,
W74-02297 8I

SPECTROPHOTOMETRY
Extraction and Spectrophotometric Determination of Vanadium as a Mixed Ligand Complex of Oxine and Azide,
W74-02362 5A

Pyridine Ketoximes as Analytical Reagents: The Spectrophotometric Determination of Cobalt with 2-Pyridyl-2-Thienyl-Beta-Ketoxime,
W74-02364 5A

Analysis of High-Purity Water by Flameless Atomic-Absorption Spectroscopy. Part II. Signal Integration with a Non-Resonance Line Correction System for Spurious Absorption Phenomena,
W74-02385 5A

Atomic Absorption and Fluorescence Spectrometry with a Carbon Filament Atom Reservoir. Part XIV. The Determination of Vanadium in Fuel Oils,
W74-02400 5A

Mercury in Fish, Sediments, and Water in Lake Oahe, South Dakota,
W74-02423 5A

Anionic Exchange Separations of the Elements that can be Extracted with Tributyl Phosphate. II, (Anionenaustauschtrennungen der mit Tributylphosphat extrahierbaren Elemente. II),
W74-02432 2K

Application of Activated Carbon for the Enrichment of Trace Elements and Their Determination by Atomic Absorption Spectrometry, (Uber die Verwendung von Aktivkohle zur Anreicherung von Spurenelementen mit nachfolgender Bestim mung durch Atomabsorptions-Spektrometrie,
W74-02433 5A

SPECTROSCOPY
Detection of Pollutants in Water by Raman Spectroscopy,
W74-02164 5A

Surface Quality Assessment of Natural Bodies of Water,
W74-02181 5A

Organic Films on Natural Waters: Their Retrieval, Identification, and Modes of Elimination,
W74-02182 5A

SPINACH
Determination of Trace Fluorine in Biological Materials by Photonuclear Activation Analysis,
W74-02361 5A

SPORT FISHERY
The Demand for and Value of the Sport Fishery on the Au Sable, Jordan, and Red Cedar Rivers,
W74-02204 6B

SPORT FISHING
Economic Evaluation of the Sport Fishery of the Au Sable River, Michigan,
W74-02203 6B

SPRING WATERS
Kelly V. Alpstetten Association, Inc. (Action to Enjoin Termination of Water Service, Wherein Defendant Counterclaimed for Back Charges).
W74-02532 6E

SPRINKLER IRRIGATION
Minimizing Nitrate Seepage from the Hula Valley into Lake Kinneret (Sea of Galilee): 1. Enhancement of Nitrate Reduction by Sprinkling and Flooding,
W74-02153 5B

STANDARDS
A Summary Analysis of Nineteen Tests of Proposed Evaluation Procedures on Selected Water and Land Resource Projects.
W74-02188 6B

STATE GOVERNMENTS
Approaches to State Coastal Management,
W74-02185 2L

Financing Private Water Resource Development: Analysis of A State Loan Program,
W74-02221 3F

Yoffe V. Special Board, Chapter 387, (State Denial of License to Exploit Natural Resources of a Lake Bed).
W74-02514 6E

STATE WATER PLAN (N MEX)
State Water Plan,
W74-02457 6B

Population Projectsions for the New Mexico State Water Plan,
W74-02458 6B

STATISTICAL METHODS
Probability Analysis in an Approximate Theory of Movement of Water Masses, (Veroyatnostnyy analiz v priblizhennoy teorii peremeshcheniya vodnykh mass),
W74-02305 2E

Experience in a Quantitative Assessment of Organization of Snow Cover as a Natural System (Opyt kolichestvennoy otsenki organizatsii snezhnogo pokrova kak prirodnoy sistemy),
W74-02613 2C

STATISTICAL MODELS
Quick-Time Instrumental Measurements of Wastewater Organic Characteristics,
W74-02170 5A

STATUTES
Levees and Drains--Change of Water-Courses.
W74-02536 6E

STEEL INDUSTRY
The Impact of Water Pollution Abatement on Competition and Pricing in the Alabama Steel Industry,
W74-02437 5D

STEROLS
Chemistry of Marine Natural Products,
W74-02189 5B

STOCHASTIC PROCESSES
Input Specifications to Stochastic Decision Models,
W74-02209 2E

STORAGE
An Airborne Gamma Survey of Moisture Content in the Surface Detention Layer, (Samoletnaya gamma-s'yemka zapasov vlagi v sloye poverkhnostnogo zaderzhaniya),
W74-02307 2G

STORM DRAINS
Urban Storm Drainage Activities in New York,
W74-02171 4A

STORM RUNOFF
Computer Simulation of Storm Water Runoff,
W74-02310 2E

Annual Compilation and Analysis of Hydrologic Data for Urban Studies in the Houston, Texas Metropolitan Area, 1971,
W74-02471 2E

Genova V. City of Kansas City (Nuisance Action Brought by Landowner Against City for Damage to Property Allegedly Caused by Flow of Surface Waters from City-Owned Cemetery).
W74-02519 6E

STORMS
Storm Rainfall in the Carpathians in June 1969,
W74-02606 2B

Storm Rainfall in the Black Sea Region as a Factor in Soil Erosion,
W74-02607 2B

STREAM GAGES
Monitoring of Streamflow in the Verde River by ERTS-1 Data Collection System (DCS),
W74-02594 7B

Preliminary Analysis of ERTS-Relayed Water-Resources Data in the Delaware River Basin,
W74-02595 7B

STREAM STABILIZATION
Hydrologic Evaluations in Bridge Pier Scour Design,
W74-02309 8B

STREAMFLOW
An Enclosed Weir for Small Streams in Snow Country,
W74-02249 7B

River Regimes in Iran,
W74-02298 2E

STREAMFLOW FORECASTING
Elevation Dependent Model for Estimating Annual Runoff,
W74-02317 2A

STREAMFLOW SYNTHESIS
Input Specifications to Stochastic Decision Models,
W74-02209 2E

STRESS
Hyperbolic Stress Equations for Compressible Slabs,
W74-02624 2C

STRIP MINES
Digital Analysis of Potomac River Basin ERTS Imagery: Sedimentation Levels at the Potomac-Anacostia Confluence and Strip Mining in Allegheny County, Maryland,
W74-02583 7B

STRIP MINING
ERTS-1 Investigation of Ecological Effects of Strip Mining in Eastern Ohio,
W74-02572 7B

The Use of ERTS-1 MSS Data for Mapping Strip Mines and Acid Mine Drainage in Pennsylvania,
W74-02573 7B

STRONTIUM
Strontium, Calcium and the Isotopic Composition of Strontium in Underground Waters from the Scioto River Basin, Ohio,
W74-02218 2F

STRONTIUM-90
Some Regularities of Sr90 Accumulation in the Body of a Rat with a High Fluorine Content in Its Drinking Water, (In Russian),
W74-02195 5C

Accumulation of Strontium and Calcium in Freshwater Fishes of Japan,
W74-02197 5C

STRUCTURAL GEOLOGY
Geologic Control of Ground Water Movement in a Portion of the Delaware Piedmont,
W74-02320 2F

ERTS-1 Image Contributes to Understanding of Geologic Structures Related to Managua Earthquake, 1972,
W74-02561 7B

Recognition of Surface Lithologic and Topographic Patterns in Southwest Colorado with ADP Techniques,
W74-02562 7B

ERTS-1 Imagery as an Aid to the Definition of the Geotectonic Domains of the Southern African Crystalline Shield,
W74-02563 7B

New Aspects on the Tectonic of the Alps and the Apennines Revealed by ERTS-1 Data,
W74-02564 7B

Structural Lineaments of Gaspe from ERTS Imagery,
W74-02565 7B

Lineaments in Coastal Plain Sediments as Seen in ERTS Imagery,
W74-02566 7B

Structural Interpretations Based on ERTS-1 Imagery, Bighorn Region, Wyoming-Montana,
W74-02568 7B

Applicability of ERTS-1 to Lineament and Photogeologic Mapping in Montana--Preliminary Report,
W74-02569 7B

A New Fault Lineament in Southern California,
W74-02570 7B

Fracture Mapping and Strip Mine Inventory in the Midwest by Using ERTS-1 Imagery,
W74-02571 7B

Total Isotopic Composition and Hydrochemical Characteristics of Natural Waters in Northwestern and Northern Fergana (Summarnyy izotopnyy sostav i gidrokhimicheskiye osobennosti prirodnykh vod Severo-Zapadnoy i Severnoy Fergany),
W74-02608 2K

SUBMERGED LANDS
State V. Placid Oil Company (Action by State to Establish Its Ownership of Submerged Lands).
W74-02534 6E

Submerged Lands.
W74-02540 6E

SUBSURFACE DRAINAGE
A Self-Draining Subsurface Rainfall Conservation System: Its Effect on the Soil Water Status and Productivity of Coastal Plains Sands,
W74-02193 2G

SUCCESSION
Experimental Studies on Phytoplankton Succession in Cayuga Lake,
W74-02217 5C

SUDAN
Application and Consequences of Precipitation Observations in the Republic of Sudan in View of the Nomadic Life and Economy,
W74-02348 2B

SULFITE LIQUORS
Sodium Recovery from a Pulp Mill Waste Effluent by Ion Exchange,
W74-02259 5D

SUPERNATANT FLUID
Effect of Supernatant Fluid of the Ankistro-Desmus braunii Brunnth Culture on Development of Algae in Waste Waters of the Chernigov Chemical Fiber Industrial Group, (In Ukrainian),
W74-02245 5C

SURFACE DRAINAGE
Camden Special Road District of Ray County V. Taylor, (Action by Special Road District for Mandatory Injunction Compelling Landowners to Remove Levy and to Permanently Enjoin them from Constructing Levy).
W74-02523 6E

SURFACE RUNOFF
Genova V. City of Kansas City (Nuisance Action Brought by Landowner Against City for Damage to Property Allegedly Caused by Flow of Surface Waters from City-Owned Cemetery).
W74-02519 6E

SURFACE WATERS
Migration of Substances with Surface and Gravitational Waters in Soils of Geochemically Related Landscapes of Baraba, (Migratsiya veshchestv s pverkhnostnymi i gravitatsionnymi vodami v pochvakh geokhimicheski sopryazhennykh landshaftov Baraby),
W74-02300 2G

Nitrogen, Phosphorus, and Trace Elements in Florida Surface Waters, 1970-71,
W74-02476 5A

Hydrology and Water Resources of the Neponset and Weymouth River Basins, Massachusetts,
W74-02480 7C

Chemical Characteristics of Surface Waters in the Upper Chirchik River Basin (Khimicheskaya kharakteristika poverkhnostnykh vod verkhney chasti basseyna r. Chirchik),
W74-02612 2K

Water-Resources Appraisal of Fish Lake Valley, Nevada and California,
W74-02616 2A

Water Resources of the Big Sioux River Valley Near Sioux Falls, South Dakota,
W74-02619 2E

Summary of Hydrologic Conditions in Collier County, Florida, 1972,
W74-02622 2A

Water Resources of the Skokomish Indian Reservation, Washington,
W74-02623 2G

Proposed Water-Resources and Land-Capability Investigation, Arusha Region, Tanzania,
W74-02627 2A

SURFACE WAVES
Surface and Internal Waves, (Poverkhnostnyye i vnutrenniye volny),
W74-02299 2E

SURFACES
Investigation of the Relation Between Moisture Potential and 'Reduced Film Thickness' for Disperse Systems with Nonporous Particles, (Issledovaniye zavisimosti mezhdu potentsialom vlazhnosti i 'privedennoy tolshchincy plenki' dlya di spersnykh sistem s neporistymi chastitsami),
W74-02304 2G

SURVEYS
Evaluation of Commercial Utility of ERTS-A Imagery in Structural Reconnaissance for Minerals and Petroleum,
W74-02567 7B

Mapping Atlantic Coastal Marshlands, Maryland, Georgia, Using ERTS-1 Imagery,
W74-02577 7B

Identification of Marsh Vegetation and Coastal Land Use in ERTS-1 Imagery,
W74-02578 7B

Polluted and Turbid Water Masses in Osaka Bay and Its Vicinity Revealed with ERTS-A Imageries,
W74-02586 7B

Red Tide in Ise Bay,
W74-02587 7B

SUSPENDED SOLIDS
Complex Behaviour of Cobalt in the Danube River,
W74-02373 5B

Method for Removing Suspended Solids from Liquids,
W74-02484 5D

SWEDEN
Hylte Bruk: Newsprint and Environmental Protection, (Hylte Bruk: Zeitungsdruckpapier and Umweltschultz).
W74-02256 5D

SWITZERLAND
Salt, a Little-Known Aggressor in Our Environment, (In French),
W74-02199 5B

SYNTHETIC FIBERS
Effluent Treatment at Man-Made Fibre Production Units,
W74-02263 5D

SYNTHETIC HYDROLOGY
Input Specifications to Stochastic Decision Models,
W74-02209 2E

SYSTEMS ANALYSIS
Systems Analysis of Irrigation Water Management in Eastern Idaho,
W74-02322 4B

Water Resources Development in the Mullica River Basin,
W74-02450 5C

TAMPA BAY AREA (FLA)
Basic Water-Quality Data for Pollution Abatement Plan, Tampa Bay Area, Florida,
W74-02629 5B

TANNERY WASTES
Treatment of Tannery Effluents by Physical-Chemical Processes,
W74-02175 5D

TANTALUM FILAMENT ATOMIZER
Determination of Trace Amounts of Chromium by Atomic Absorption Spectrometry with a Tantalum Filament Atomizer,
W74-02367 2K

TELEMETRY
Monitoring of Streamflow in the Verde River by ERTS-1 Data Collection System (DCS),
W74-02594 7B

Preliminary Analysis of ERTS-Relayed Water-Resources Data in the Delaware River Basin,
W74-02595 7B

TEMPERATURE
Design, Operation, and Temperature Sensitivity of A Thermocouple Psychrometer Moisture Potentiometer Based on the Peltier Effect, (Konstruktsiya, metodika primeneniya i temperaturnaya chuvstvitel'nost' termoparnogo psikhrometrichesko go vlagopotentsiometra, osnovannogo na effekte Pel't'ye),
W74-02303 2G

Determination of the Microlevel Temperatures During Lake Cooling, Ice Formation, Icemelt and the Break-up of the Ice cover of a Mountain Lake, Holland Lake, Missoula County,
W74-02447 2C

Thermal Regime of the Lower Reaches of the Danube River in Autumn and Winter,
W74-02605 2C

A Hydrogeothermal Description of Groundwater in Upper Cretaceous Deposits in the Southeast Aral Sea Area (Gidrogeotermicheskaya kharakteristika podzemnykh vod verkhnego mela Yugo-Vostochnogo Priaral'ya),
W74-02609 2F

TENNESSEE
The Effects on Runoff, Groundwater, and Land of Irrigating With Cattle Manure Slurries,
W74-02326 5D

Impact of Sewage Treatment Modifications on Water Quality of a Reservoir,
W74-02483 5D

TERRAIN ANALYSIS
Aerial Remote Sensing of Carbonate Terranes in Shelby County, Alabama,
W74-02467 7B

Recognition of Surface Lithologic and Topographic Patterns in Southwest Colorado with ADP Techniques,
W74-02562 7B

TERTIARY TREATMENT
Advanced Treatment of Purified Sewage for Production of High-Brightness Pulp and Paper,
W74-02280 5D

TESTING
A Summary Analysis of Nineteen Tests of Proposed Evaluation Procedures on Selected Water and Land Resource Projects.
W74-02188 6B

TEXAS
Severe Floods at New Braunfels, Texas, May 1972,
W74-02173 2E

City of Austin, Texas, Study of Wastewater Collection System: Phase I.
W74-02330 5D

Metropolitan Water and Sewer Plan, Lubbock Metropolitan Council of Governments.
W74-02331 3D

Annual Compilation and Analysis of Hydrologic Data for Urban Studies in the Houston, Texas Metropolitan Area, 1971,
W74-02471 2E

Annual Compilation and Analysis of Hydrologic Data for Little Elm Creek, Trinity River Basin, Texas, 1971,
W74-02477 2E

Annual Compilation and Analysis of Hydrologic Data for Calaveras and Escondido Creeks, San Antonio River Basin, Texas, 1971,
W74-02478 2E

Coleman V. Forister (Suit to Establish Right of Use of Land for Ingress and Egress to Creek Waterfront).
W74-02517 6E

Groundwater Resources of Val Verde County, Texas,
W74-02620 2F

Annual Compilation and Analysis of Hydrologic Data for Green Creek, Brazos River Basin, Texas, 1971,
W74-02626 4D

TEXTILE INDUSTRY
Stability and Removal of Commercial Dyes from Process Wastewater,
W74-02429 5B

TEXTILES
Effluent Treatment at Man-Made Fibre Production Units,
W74-02263 5D

THAWING
Determination of the Microlevel Temperatures During Lake Cooling, Ice Formation, Icemelt and the Break-up of the Ice cover of a Mountain Lake, Holland Lake, Missoula County,
W74-02447 2C

THERMAL PLUME
An Investigation of the Physical Effects of Thermal Discharges into Cayuga Lake,
W74-02178 5B

THERMAL POLLUTION
An Investigation of the Physical Effects of Thermal Discharges into Cayuga Lake,
W74-02178 5B

The Use of Power Plant Heat in a Physical-Chemical Domestic Wastewater Renovation System,
W74-02208 5D

Studies of the Sinking Plume Phenomenon,
W74-02644 5C

THERMAL POWER
Effect of a Cinder Settling Tank of a Thermal Electric Power Plant on the Quality of Subsurface Waters, (In Russian),
W74-02231 5B

THERMOCOUPLE PSYCHROMETERS
Design, Operation, and Temperature Sensitivity of A Thermocouple Psychrometer Moisture Potentiometer Based on the Peltier Effect, (Konstruktsiya, metodika primeneniya i temperaturnaya chuvstvitel'nost' termoparnogo psikhrometrichesko go vlagopotentsiometra, osnovannogo na effekte Pel't'ye),
W74-02303 2G

THIN LAYER CHROMATOGRAPHY
Separation and Identification of Metal Dithizonates by Thin-Layer Chromatography and its Application in Toxicological Analysis,
W74-02360 5A

TILAPIA-RENDALLI
Comparative Biology of Tilapia rendalli (Boulenger) (Pisces cichlidae) in Lake Itasy and Lake Mantasoa, (In French),
W74-02344 2H

TOMBIGBEE RIVER (MISSISSIPPI)
Tombigbee River Valley Water Management District, Tenth Annual Report.
W74-02332 6B

TOPOGRAPHY
Elevation Dependent Model for Estimating Annual Runoff,
W74-02317 2A

TOTAL NITROGEN
Quick-Time Instrumental Measurements of Wastewater Organic Characteristics,
W74-02170 5A

TOTAL ORGANIC CARBON
Quick-Time Instrumental Measurements of Wastewater Organic Characteristics,
W74-02170 5A

TOTAL OXYGEN DEMAND
Quick-Time Instrumental Measurements of Wastewater Organic Characteristics,
W74-02170 5A

TOXAPHENE
Toxaphene Accumulation in Fish in Lakes Treated for Rough Fish Control,
W74-02425 5C

TOXICITY
Measuring Stress in Fish Exposed to Pulp Mill Effluents,
W74-02276 5C

Laboratory and Controlled Experimental Stream Studies of the Effects of Kraft Effluents on Growth and Production of Salmonid Fish,
W74-02277 5C

Chlorodioxins in Pesticides, Soils, and Plants,
W74-02371 5B

TOXICITY

Current Status of the Environmental and Human Safety Aspects of Nitrilotriacetic Acid (NTA),
W74-02394 5B

TRACE ELEMENTS

Application of Activated Carbon for the Enrichment of Trace Elements and Their Determination by Atomic Absorption Spectrometry, (Uber die Verwendung von Aktivkohle zur Anreicherung von Spurenelementen mit nachfolgender Bestim mung durch Atomabsorptions-Spektrometrie,
W74-02433 5A

A Mass Balance Model of Trace Metals in Several Delaware Watersheds,
W74-02443 5B

Nitrogen, Phosphorus, and Trace Elements in Florida Surface Waters, 1970-71,
W74-02476 5A

TRACE LEVELS

Pyridine Ketoximes as Analytical Reagents: The Spectrophotometric Determination of Cobalt with 2-Pyridyl-2-Thienyl-Beta-Ketoxime,
W74-02364 5A

The Determination of Pentachlorophenol and Hexachlorophene in Human Adipose Tissue,
W74-02391 5A

Detection and Estimation of Isopropyl Methylphosphonofluoridate and O-Ethyl S-Diisopropylaminoethylmethylphosphonothioate in Seawater in Parts-Per-Trillion Level,
W74-02427 5A

Separation and Gas-Chromatographic Determination of Traces of Fluoride, (Abtrennung und gas-chromatographische Bestimmung von Fluoridspuren),
W74-02431 5A

TRACERS

Strontium, Calcium and the Isotopic Composition of Strontium in Underground Waters from the Scioto River Basin, Ohio,
W74-02218 2F

TRANSPIRATION

A Study of Items in the Groundwater Balance of Waterlogged Areas (Ob uzuchenii elementov balansa gruntovykh vod no zabolochennykh uchastkakh),
W74-02610 2D

TRAVELTIME

Probability Analysis in an Approximate Theory of Movement of Water Masses, (Veroyatnostnyy analiz v priblizhennoy teorii peremeshcheniya vodnykh mass),
W74-02305 2E

TREATMENT FACILITIES

Optimum Design Period for Water Pollution Control Plants,
W74-02222 5D

Purification of Effluents by Means of Reverse Osmosis, (Ochistka stochnykh vod metodom obratnogo osmosa),
W74-02258 5D

Ion Exchange and Allied Processes in Water Recovery,
W74-02268 5D

Experience with the Operation of Purification Equipment, (Opyt ekspluatatsii ochistnykh sooruzhenii),
W74-02272 5D

Water Quality Control Program at Publishers Paper Co.,
W74-02275 5D

Process Water Reuse and Upset Control Modifications at an Integrated NSSC Mill,
W74-02283 5D

Color Removal from Kraft Pulp Mill Effluents by Massive Lime Treatment,
W74-02284 5D

Regional Wastewater Facilities Study.
W74-02338 5D

The Impact of Water Pollution Abatement on Competition and Pricing in the Alabama Steel Industry,
W74-02437 5D

TREES

Moisture Regime of Southern Chernozem Within Shelterbelts, (Rezhim vlazhnosti yuzhnogo chernozema v sisteme lesnykh polos),
W74-02302 2G

TRICKLE IRRIGATION

Trickle Irrigation on Cotton,
W74-02347 3F

TRIEN

Amperometric Titration of Mercury (II) with EDTA, DTPA and Trien in the PPM-Range,
W74-02405 5A

TRINITY RIVER BASIN (TEX.)

Annual Compilation and Analysis of Hydrologic Data for Little Elm Creek, Trinity River Basin, Texas, 1971,
W74-02477 2E

TROPHIC LEVEL

Computer Simulation of Trophic Level Interrelationships in Cayuga Lake,
W74-02216 5C

TROPICAL STORMS

Hurricane Agnes Floods East Mahantango Creek,
W74-02174 2E

TSUNAMIS

Surface and Internal Waves, (Poverkhnostnyye i vnutrenniye volny),
W74-02299 2E

TUNNEL EROSION

Slope Aspect and Tunnel Erosion in the Loess of Banks Peninsula, New Zealand,
W74-02288 2J

TURBIDITY

Water Turbidity Detection Using ERTS-1 Imagery,
W74-02582 7B

Remote Sensing of Turbidity Plumes in Lake Ontario,
W74-02601 7B

TURBULENCE

Application of ERTS Data to the Detection of Thin Cirrus and Clear Air Turbulence,
W74-02585 7B

ULTRASONICS

Ultrasonic River Flow Measurement,
W74-02250 2E

ULTRAVIOLET RADIATION

Optical Constants of Water in the 200-nm to 200-Micrometer Wavelength Region,
W74-02167 2K

UNITED ARAB REPUBLIC

Factors Affecting the Manganese Status in Soils of the U.A.R.,
W74-02200 2G

UNITED ARAB REPUBLIC (LAKE MARIUT)

Quantitative Estimation of Bottom Fauna in Lake Mariut,
W74-02549 2H

UNITED KINGDOM (SOUTH WINTERBOURNE)

The Chemical Composition and Flow of the South Winterbourne in Dorset,
W74-02190 2K

UNITED KINGDOM (THAMES RIVER)

Ultrasonic River Flow Measurement,
W74-02250 2E

UNITED REPUBLIC OF TANZANIA

Proposed Water-Resources and Land-Capability Investigation, Arusha Region, Tanzania,
W74-02627 2A

UNITED STATES

Selected References, Ground-Water Contamination, The United States of America and Puerto Rico.
W74-02482 5B

River Basin Monetary Authorizations--Disaster Relief Act Amendments.
W74-02516 6E

Environmental Protection Act of 1973, First Session on S.1104.
W74-02518 6E

A Bill to Prescribe Procedures so as to make Administration of the National Environmental Policy Act of 1969 More Effective.
W74-02528 6E

Submerged Lands.
W74-02540 6E

UNSATURATED FLOW

Saturated-Unsaturated Seepage by Finite Elements,
W74-02313 2G

On Solving the Unsaturated Flow Equation: The Flux-Concentration Relation,
W74-02464 2G

UNSTEADY FLOW

A New Oscillating Water Tunnel,
W74-02160 2J

A Shear Plate for Use in Oscillatory Flow,
W74-02161 2E

URANIUM

Determination of Small Amounts of Uranium After Concentrating Through Extraction and Anionic Exchange in a Solvent Agent System Containing Tri-N-Octylphosphine Oxide. (Bestimmung geringer Uranmengen nach Konzentrierun g durch Extraktion und Anionenaustausch in einem tri-n-octylphoshinoxidhaltigen Losungsmittelsystem),
W74-02434 5A

URBAN DRAINAGE

Urban Storm Drainage Activities in New York,
W74-02171 4A

Genova V. City of Kansas City (Nuisance Action Brought by Landowner Against City for Damage to Property Allegedly Caused by Flow of Surface Waters from City-Owned Cemetery).
W74-02519 6E

URBAN HYDROLOGY
Computer Simulation of Storm Water Runoff,
W74-02310 2E

Annual Compilation and Analysis of Hydrologic Data for Urban Studies in the Houston, Texas Metropolitan Area, 1971,
W74-02471 2E

URBAN LANDSCAPES
A Study of Water Used on Urban Landscapes,
W74-02459 6B

URBAN RUNOFF
Water Quality Characteristics of Storm Sewer Discharges and Combined Sewer Overflows,
W74-02345 5B

URBANIZATION
City of Austin, Texas, Study of Wastewater Collection System: Phase I.
W74-02330 5D

A Study of Water Used on Urban Landscapes,
W74-02459 6B

UREA
Attempt at Mollusk Control by Increasing the Planktonic Biomass and by Molluscicidal Treatment: The Urea-N-Tritylmorpholine Association (In French),
W74-02226 5C

UREAS
An Automated Analysis for Urea in Seawater,
W74-02421 5A

URINE
The Determination of Methyl Mercury in Urine,
W74-02387 5A

UROCHROME
Cleanliness of Wells, Chemical Substances in Drinking Water and Their Relation to Caries (In Polish),
W74-02544 5C

URUGUAY
Agroclimatic Areas for Wheat and Bioclimatic Characteristics of its Cultivars in Uruguay, (In Spanish),
W74-02354 3F

USER RELATED STUDY
User Related Study of Three Michigan Rivers,
W74-02202 6B

USSR
Using the Adsorption Method on Activated Charcoal with Chloroform Extraction (CCE) for Evaluating Water Pollution by Organic Substances, (In Russian),
W74-02232 5B

Effect of Supernatant Fluid of the Ankistro-Desmus braunii Brunnth Culture on Development of Algae in Waste Waters of the Chernigov Chemical Fiber Industrial Group, (In Ukrainian),
W74-02245 5C

Design, Operation, and Temperature Sensitivity of A Thermocouple Psychrometer Moisture Potentiometer Based on the Peltier Effect, (Konstruktsiya, metodika primeneniya i temperaturnaya chuvstvitel'nost' termoparnogo psikhrometrichesko go vlagopotentsiometra, osnovannogo na effekte Pel't'ye),
W74-02303 2G

Thermal Regime of the Lower Reaches of the Danube River in Autumn and Winter,
W74-02605 2C

Storm Rainfall in the Carpathians in June 1969,
W74-02606 2B

Storm Rainfall in the Black Sea Region as a Factor in Soil Erosion,
W74-02607 2B

Total Isotopic Composition and Hydrochemical Characteristics of Natural Waters in Northwestern and Northern Fergana (Summarnyy izotopnyy sostav i gidrokhimicheskiye osobennosti prirodnykh vod Severo-Zapadnoy i Severnoy Fergany),
W74-02608 2K

A Hydrogeothermal Description of Groundwater in Upper Cretaceous Deposits in the Southeast Aral Sea Area (Gidrogeotermicheskaya kharakteristika podzemnykh vod verkhnego mela Yugo-Vostochnogo Priaral'ya),
W74-02609 2F

A Study of Items in the Groundwater Balance of Waterlogged Areas (Ob uzuchenii elementov balansa gruntovykh vod no zabolochennykh uchastkakh),
W74-02610 2D

Some Problems in Age Determination of Groundwater (Nekotoryye voprosy rascheta vozrasta podzemnykh vod),
W74-02611 2F

Chemical Characteristics of Surface Waters in the Upper Chirchik River Basin (Khimicheskaya kharakteristika poverkhnostnykh vod verkhney chasti basseyna r. Chirchik),
W74-02612 2K

Experience in a Quantitative Assessment of Organization of Snow Cover as a Natural System (Opyt kolichestvennoy otsenki organizatsii snezhnogo pokrova kak prirodnoy sistemy),
W74-02613 2C

Bear Glacier Has Come Alive (Lednik Medvezhiy ozhil),
W74-02614 2C

USSR (AZERBAYDZHAN)
Contribution to the Study of Zooplankton and Zoobenthos in the Mingechaur Reservoir, (In Russian),
W74-02341 2H

USSR (BARABA LOWLANDS)
Migration of Substances with Surface and Gravitational Waters in Soils of Geochemically Related Landscapes of Baraba, (Migratsiya veshchestv s pverkhnostnymi i gravitatsionnymi vodami v pochvakh geokhimicheski sopryazhennykh landshaftov Baraby),
W74-02300 2G

USSR (KAIBYSHEV RESERVOIR)
The Ability of Bacteria to Mineralize Algae Organic Matter, (In Russian),
W74-02252 5B

USSR (KAIRAK-KUM RESERVOIR)
Microflora and Chemical Composition of the Bottom Deposits of the Kairak-Kum Reservoir, (In Russian),
W74-02253 5B

USSR (KARSHI STEPPE)
Grasshoppers and Crickets in the Karshi Steppe, (In Russian),
W74-02239 3F

USSR (KOKCHETAV OBLAST)
Moisture Regime of Southern Chernozem Within Shelterbelts, (Rezhim vlazhnosti yuzhnogo chernozema v sisteme lesnykh polos),
W74-02302 2G

USSR (KONAKOV)
Effect of Heated Water from Konakov Hydro-Electric Station on Oxygen Content and Development of Phytoplankton in Ivan'Kovskoe Reservoir During Winter, (In Russian),
W74-02244 5B

USSR (KUIBYSHEV RESERVOIR)
The Age Group Distribution of Pelobates fuscus (Laur.) at the Kuibyshev Reservoir Shores (In Russian),
W74-02641 2H

USSR (NORTH CASPIAN SEA REGION)
Water Regime of Solonchak Solonetzes in Open Areas of Forests in the North Caspian Sea Region, (Vodnyy rezhim solonchakovykh solontsov na polyanakh lesnykh nasazhdeniy Severnogo Prikaspiya),
W74-02301 2G

USSR (RYBINSK STORAGE LAKE)
The Prospects of Using the Rybinsk Water Storage Basin for Fisheries, (In Russian),
W74-02241 8I

USSR (SHELON' RIVER BASIN)
An Airborne Gamma Survey of Moisture Content in the Surface Detention Layer, (Samoletnaya gamma-s'yemka zapasov vlagi v sloye poverkhnostnogo zaderzhaniya),
W74-02307 2G

USSR (TASKENT)
Lake Sary-Chelek and its Zooplankton, (In Russian),
W74-02261 2H

USSR (TAVDA)
Experience with the Operation of Purification Equipment, (Opyt ekspluatatsii ochistnykh sooruzhenii),
W74-02272 5D

USSR (VARUARA RESERVOIR)
Seasonal Variations in the Qualitative and Quantitative Composition of Young Fish Populations in the Varvara Reservoir, (In Russian),
W74-02560 2H

USSR (WEST SIBERIA)
Phytoindication of Saline Ground in Drying Up Shallow Lakes, (In Russian),
W74-02559 2H

VAL VERDE COUNTY (TEX)
Groundwater Resources of Val Verde County, Texas,
W74-02620 2F

VANADIUM
Extraction and Spectrophotometric Determination of Vanadium as a Mixed Ligand Complex of Oxine and Azide,
W74-02362 5A

VANADIUM

Atomic Absorption and Fluorescence Spectrometry with a Carbon Filament Atom Reservoir. Part XIV. The Determination of Vanadium in Fuel Oils,
W74-02400 5A

VEGETATION
Chlorodioxins in Pesticides, Soils, and Plants,
W74-02371 5B

Use of the Sri Electronic Satellite Image Analysis Console for Mapping Southern Arizona Plant Communities from ERTS-1 Imagery,
W74-02593 7B

VERDE RIVER (ARIZ)
Monitoring of Streamflow in the Verde River by ERTS-1 Data Collection System (DCS),
W74-02594 7B

VERMONT
Regional Wastewater Facilities Study.
W74-02338 5D

Kelly V. Alpstetten Association, Inc. (Action to Enjoin Termination of Water Service, Wherein Defendant Counterclaimed for Back Charges).
W74-02532 6E

VIRUSES
Concentration of Enteroviruses from Large Volumes of Water,
W74-02271 5F

VOLTAMMETRIC DETECTOR
Voltammetric Identification of Organochlorine Insecticides, Polychlorinated Biphenyls, Polychlorinated Naphthalenes and Polychlorinated Benzenes,
W74-02389 5A

VOLUMETRIC ANALYSIS
Applications, Involving the Iodide Ion. VIII. Direct and Indirect Determination of Mercury (I) and Analysis of Mixtures. Analysis of Chromium (VI)-Chromium (III) Mixtures. Determination of Hypochlorite,
W74-02395 5A

Amperometric Titration of Mercury (II) with EDTA, DTPA and Trien in the PPM-Range,
W74-02405 5A

Analysis by Means of Gas Bubble Electrification,
W74-02406 2K

WALTON COUNTY (GEO)
A Water and Sewer Plan: Walton County, Georgia.
W74-02337 5D

WASHINGTON
The Hydrology of Ten Streams in Western Washington as Related to the Propagation of Several Pacific Salmon Species,
W74-02297 8I

Water Resources of the Skokomish Indian Reservation, Washington,
W74-02623 2G

Puget Sound Resident Coho Salmon Study,
W74-02639 2L

WASTE DISPOSAL
Two Environmental Analyses Involving Agriculture,
W74-02166 5B

WASTE DISPOSAL WELLS
Determination of the Mechanical Compatibility of Porous Rocks with Waste Water in its Subsurface Disposal,
W74-02165 5B

WASTE DUMPS
Monitoring Vegetation Cover on Mine Dumps with ERTS-1 Imagery: Some Initial Results,
W74-02574 7B

WASTE IDENTIFICATION
Characterization of Waste Effluents from a Commercial Pimento Canning Operation,
W74-02379 5A

WASTE MANAGEMENT
The Effects on Runoff, Groundwater, and Land of Irrigating With Cattle Manure Slurries,
W74-02326 5D

WASTE WATER DISPOSAL
Water Quality Management in Groundwater Basins,
W74-02356 5B

WASTE WATER TREATMENT
Treatment of Tannery Effluents by Physical-Chemical Processes,
W74-02175 5D

Mathematical Relationships of BOD Removal in Activated Sludge Process,
W74-02176 5D

Cost Effectiveness in Pollution Control--Treatment of Glue Factory Wastes by Carbon Adsorption System,
W74-02177 5D

In Situ Treatment Methods for Hazardous Material Spills,
W74-02179 5D

The Use of Power Plant Heat in a Physical-Chemical Domestic Wastewater Renovation System,
W74-02208 5D

Manufacture of Capacitor Paper -- Some Problems with Fresh Water Preparation, (Erzeugung von Kondensatorpapier -- einige Probleme bei der Frischwasserherstellung),
W74-02247 5D

Use of Fibrous Materials for Removal of Iron and Iron Compounds From Thermoelectric Power Plant Water and Condensates, (Izpolzuvane na vlaknest material za ulavyane na zhelezo i zhelezni suedineniya ot vodite i kondenzatite na tets),
W74-02251 5D

Hylte Bruk: Newsprint and Environmental Protection, (Hylte Bruk: Zeitungsdruckpapier and Umweltschultz).

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Methods for chemical and biological identification and measurement of pollutants at the Analytical Quality Control Laboratory of the Environmental Protection Agency.
- Coastal pollution at the Oceanic Research Institute.
- Water treatment plant waste pollution control at American Water Works Association.
- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 7, NUMBER 6
MARCH 15, 1974

W74-02651 -- W74-03200

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $45 (domestic), $56.25 (foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Deoartment of the Interior

VOLUME 7, NUMBER 6
MARCH 15, 1974

W74-02651 -- W74-03200

e Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is neces-
ıry in the transaction of the public business required by law of this Department. Use of funds for printing this pe-
odical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ABSTRACT SOURCES

SELECTED WATER RESOURCES ABSTRACTS

01. NATURE OF WATER

1B. Aqueous Solutions and Suspensions

THE IONIC ACTIVITY FUNCTION OF WATER AND THE ACTIVITY COEFFICIENT OF THE HYDROGEN ION IN SEAWATER,
Sydney Univ. (Australia). Dept. of Physical Chemistry.
J. V. Leyendekkers.
Limnology and Oceanography, Vol 18, No 5, p 784-787, September 1973. 1 fig, 3 tab, 14 ref.

Descriptors: *Hydrogen ion concentration, *Sea water, *Water chemistry, *Ionization.
Identifiers: Ion activity function.

The activity coefficient of the hydrogen ion in seawater was calculated for the ranges S±5-48 parts per thousand and 0-40 deg C, on the basis of a simple ion interaction theory that accounts only for pairwise interactions. The ionic activity function of water was estimated and compared with the values in other salt solutions. (Knapp-USGS)
W74-02760

THERMAL RADIATIVE PROPERTIES OF A SMOOTH AIR-WATER INTERFACE,
Missouri Univ. Rolla. Dept. of Mechanical and Aerospace Engineering.
For primary bibliographic entry see Field 02K.
W74-02874

INFLUENCE OF SOLVATION FACTORS ON ACIDITY. VOLUMES OF IONIZATION OF THE META AND PARA ISOMERS OF NITROPHENOL AND FORMYLPHENOL IN WATER AT 25 DEG,
Georgia Inst. of Tech., Atlanta. School of Chemistry.
C. L. Liotta, A. Abidaud, and H. P. Hopkins, Jr.
Journal of the American Chemical Society, Vol 94, p 8624, August 1972. 1 tab, 14 ref. OWRR B-049-GA (8). 14-31-0001-3269.

Descriptors: Acids, *Ionization, *Phenols, Entropy, *Acidity, *Solvation, Solutes, Solvents, Volume, *Analytical techniques.

The volumes of ionization of meta- and para-nitro and formylphenol have been determined in water at 25 deg using high precision density measurements. The results are analyzed in terms of solute-solvent interaction mechanisms. Based upon the data it appears that the solvation contribution to differences in acidity of isomeric phenols may have their primary origin in solvation differences in the un-ionized forms. (See also W74-03140)
W74-03139

THERMODYNAMICS OF ACID-BASE EQUILIBRIA. III. IONIZATION OF SUBSTITUTED ANILINIUM IONS,
Georgia Inst. of Tech., Atlanta. School of Chemistry.
C. L. Liotta, E. M. Perdue, and H. P. Hopkins, Jr.
Journal of the American Chemical Society, Vol 95, p 2439-2445, 1973. 2 fig, 3 tab, 29 ref. OWRR B-049-GA (9). 14-31-0001-3269.

Descriptors: *Ionization, *Enthalpy, Entropy, *Acid-Base equilibrium, Ions, *Thermodynamics, Analytical techniques, Aqueous solutions.
Identifiers: Gibbs free-energy, Electrostatic theory, Calorimetrically, *Anilinium ions.

The standard enthalpies of ionization of 21 meta- and para-substituted anilinium ions have been determined calorimetrically in aqueous solution at 25 deg. Standard entropies of ionization have been calculated from the experimental enthalpies of ionization and the literature Gibbs free energies of ionization. Both the enthalpies and entropies of ionization show a good linear correlation with the Gibbs free energy of ionization. The experimental results have been analyzed in terms of Hepler's theory of substituent effects and have been compared to the predictions of electrostatic theory. (See also W74-03149)

MEAN RAINFALL AND MEAN RUNOFF IN SOUTH AFRICA; AN INVESTIGATION INTO PHASE DIFFERENCES,
Natal Univ., Durban (South Africa); and Saint Andrews Univ.
R. A. Preston-Whyte, and G. W. Whittington.
The South African Geographical Journal, Vol 54, p 133-137, 1972. 2 fig, 1 tab, 12 ref.

Descriptors: *Rainfall-runoff relationships, *Fourier analysis, *Time lag, *Runoff, Rainfall, Subsurface runoff.
Identifiers: *South Africa.

Monthly rainfall normals for 356 stations in South Africa, and mean monthly runoff values for 90 gauging stations, were subjected to harmonic analysis. The time lag between mean rainfall and mean runoff was then calculated from the curve maxima of contiguous stations, whereupon regional variations in lag were mapped. The lag is attributable to the delayed contribution of subsurface flow to channel runoff. (DWA)

A DECISION-THEORETIC APPROACH TO UNCERTAINTY IN THE RETURN PERIOD OF MAXIMUM FLOW VOLUMES USING RAINFALL DATA,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
D. R. Davis, L. Duckstein, C. C. Kisiel, and M. M. Fogel.
Paper presented at Symposium on Design of Water Resource Projects with Inadequate Data, UNESCO, Madrid, Spain, June 1973. 12 p. OWRR B-032-ARIZ (2). 14-31-0001-3858.

Descriptors: *Rainfall-runoff relationships, *Risks, Watershed management, *Decision making, Optimization, Mathematical models, Stochastic processes, Simulation analysis, Systems analysis, *Distribution patterns, *Rainfall disposition, Simulated rainfall.

The maximum seasonal runoff volume for an ungaged stream site is derived using (1) an event-based rainfall model for thunderstorms, and (2) a linear rainfall-runoff model. Major emphasis is placed on effect of uncertainty in parameters of rainfall inputs on the return period of maximum runoff volumes in a season. The event-based rainfall model derives a correct distribution function for the return period under uncertainty, and demonstrates the necessity of following this approach for a decision-theoretic analysis of a water resource design problem. The approach enables us to design structures, relying only on rainfall data, on watersheds with ungaged streams by taking into account uncertainty of design site parameters. Also, the design can be tailored to a specific problem rather than using a pre-specified design flood, such as the 100-year flood. (See also W74-03137)

HIGH REYNOLDS NUMBERS UNSTEADY CONVECTIVE MASS TRANSFER FROM FLUID SPHERES,
New York Univ., N.Y.
V-D. Dang, and E. Ruckenstein.
International Journal of Heat and Mass Transfer, Vol 16, No 7, p 1371-1384, 1973. 8 fig, 2 tab, 15 ref, append.

Descriptors: *Heat transfer, *Mass transfer, *Convection, Fluid mechanics, Hydraulics, Flow, Diffusion, Chemical reactions, Mathematics, Equations, Model studies, *Reynolds number.
Identifiers: *Fluid spheres, Sherwood Number, Schmidt Number, First order reaction.

Unsteady state mass transfer between a single or binary component fluid sphere and the continuous phase at high Reynolds number flow is examined when diffusion is accompanied (or not) by a first order chemical reaction. The velocity distribution derived by Chao is used in the calculations. The similarity transformation suggested by Ruckenstein is applied to find the mass transfer in the absence of chemical reactions from a single component fluid sphere. For mass transfer with or without chemical reactions from a binary fluid sphere, the same transformation is combined with Duhamel's theorem in order to obtain the solution. Asymptotic expressions for the Sherwood number for pure mass transfer from a single component fluid sphere and for the case in which diffusion is accompanied by a first order irreversible chemical

reaction are derived. For binary component fluid spheres the quasi steady state assumption (QSSA) is examined and its resultscompared with exact analysis. (Jerome-Vanderbilt)
W74-02891

THE CONTENT OF WATER VAPOUR IN THE ATMOSPHERE OVER SOUTHERN AFRICA,
Natal Univ., Pietermaritzburg (South Africa).
O. S. McGee.
South African Geographer, Vol 4, No 1, p 25-33, September 1972. 8 fig, 6 ref.

Descriptors: *Precipitable water, *Water vapor, *Precipitation (Atmospheric), *Radiosondes, Atmosphere, Meteorology, Moisture content.
Identifiers: *Specific humidity, Vapor content, Aerological stations, South Africa.

All available radiosonde data from 7 aerological stations in South Africa were used to obtain daily values of specific humidity at the earth's surface and at standard reporting levels extending to the 300 mb level (10,000 m). These data were used to analyze the distribution of precipitable water over the subcontinent, the annual march of mean monthly precipitable water, the levels below which stipulated percentages of mean monthly precipitable water vapor occurred, and the variability of precipitable water vapor within each month. The mean specific humidity and the diurnal variations of water vapor content were also analyzed. The atmosphere's vapor content bears no resemblance to measured precipitation. Little hope exists for fomalizing any mutual relationship unless some measure of rainfall - producing mechanisms can be incorporated. (DWA)

COASTAL STORMS OF THE EASTERN UNITED STATES,
Thornthwaite (C.W.) Associates, Elmer, N.J. Lab. of climatology.
J. R. Mather, H. Adams, III, and G. A. Yoshioka.
Journal of Applied Meteorology, Vol 3, No 6, p 693-706, December 1964. 8 fig, 4 tab. ONR Contract Nonr 4043 (00).

Descriptors: *Storms, Damages, Hurricanes, *Seasonal, Coasts, Cyclones, *Waves (Water), United States.
Identifiers: *Geographic distribution.

Storms resulting in damage to the East Coast of the United States over the past 42 years have been classified into eight different synoptic situations: hurricanes; wave developments well east of the southeast coast or in the vicinity of Cuba; wave developments over Florida or the nearby Atlantic coastal waters; wave developments in the Gulf of Mexico west of 85W longitude; inland depressions that deepen upon reaching the coast; secondary cyclonic disturbances in the Hatteras area; intense cyclones moving northeastward, west of the coast; and strong cold fronts with associated squall lines. The seasonal and geographical distributions of these storm types are investigated. Coastal storms of moderate to severe intensity might be expected at any place along the East Coast of the United States on an average of once every 1.4 years in New York and New Jersey, the area of most frequent occurrence, to once every 4.2 years in Georgia, the area of least frequent occurrence. UNCERTAINTY IN THE RETURN PERIOD OF MAXIMUM EVENTS: A BAYESIAN APPROACH,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
D. Davis, L. Duckstein, C. Kisiel, and M. Fogel.
Paper presented at International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, Dec. 11-14, 1972. 10 p, 2 fig, 1 tab, 16 ref. OWRR B-032-ARIZ (1). 14-31-0001-3858.

Descriptors: *Rainfall disposition, *Distribution patterns, Watershed management, Decision making, Optimization, Mathematical models, Stochastic processes, Simulation analysis, Systems analysis, *Risks, *Simulated rainfall, Probability, Rainfall-runoff relationships.
Identifiers: *Bayesian approach.

Previous work determined that the return period of maximum point rainfall could be derived from the following event-based process valid for the summer precipitation season: (a) the number of events per season is Poisson distributed, (b) the amount of point rainfall per event may be exponentially distributed, (c) the above two random variables are independent. The purpose of this paper is (1) to obtain a correct distribution function of the return period when uncertainty arises in the parameters of the Poisson and exponential distributions and (2) to obtain the probability density function of the event corresponding to a given return stemming from the same uncertainty. The methodology employs conjugate distributions for the Poisson and exponential distributions to permit direct computation of posterior distributions of rainfall amounts given point rainfall data. Computer simulation shows that errors in estimated return periods lead to underdesign even with 20 years of data (for the example used in the analysis). Extensions of the method are possible to encompass effects of uncertainties in rainfall data samples on runoff estimates and associated economic factors. (See also W74-03138)

ABLATION CHARACTERISTICS OF AN ALPINE SNOW FIELD IN SUMMER,
Forest Service (USDA), Provo, Utah. Intermountain Forest and Range Experiment Station.
L. R. Bartos, and P. A. Rechard.
Available from the National Technical Information Service as PB-226 320 $2.75 in paper copy, $1.45 in microfiche. Partial Completion Report, (1973). 9 p, 2 fig, 9 ref. OWRR C-3129 (no 3690) (1). 14-31-0001-3690.

Descriptors: *Ablation, *Wyoming, Alpine, *Snow, Snowmelt, Seasonal.

Ablation characteristics of a summer alpine snow field in the Klondike Lake area, Medicine Bow Mountains, Wyoming, were investigated, and it was found that the mean summer ablation rate was 6.00 plus or minus 0.5 cm/day. The total change in volume of water in the snow field was determined using two techniques, mean surface ablation and area-elevation relationship based on topographic survey. Physical characteristics of the subsurface snow, such as snow density, and free water content were also evaluated.

SNOW SURVEY MEASUREMENTS THROUGH 1970,
California State Dept. of Water Resources, Sacramento. Snow Surveys and Water Supply Forecasting Section.
V. H. Lemons.
Available from State of California, Documents Section, P. O. Box 20191, Sacramento, Calif. 95820 Price $5.00. Bulletin No 129-70, September 1971. 504 p, 16 plate.

Descriptors: *Snow surveys, *Snow cover, *Water equivalent, *California, Data collections, Measurement, Snowpacks, Snowfall, Depth, Density, Analytical techniques, Cores, Snowmelt, Runoff, Water resources.

This publication makes available to cooperators in the California Cooperative Snow Surveys Program, and others concerned with snow hydrology, an updated summary of historical snow course and aerial snow depth marker data through 1970 which is compatible with data currently being collected. This summary supersedes that published in March 1965. Snow data include that obtained by standard snow survey methods on established courses as well as supplementary measurements obtained from aerial snow depth markers. (Data obtained from automatic snow sensors are published in a separate summary). Prior to 1966 water contents for aerial snow depth markers were not estimated. Data tables are arranged in order to hydrographic area, river basin, and elevation of snow courses or aerial markers within the basin. Location of snow courses and aerial snow depth marks are shown on the basin maps. (Woodard-USGS)

ADVANCES IN NORTH AMERICAN AVALANCHE TECHNOLOGY: 1972 SYMPOSIUM.
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.

Proceedings of USDA Forest Service National Avalanche Training Program, Reno, Nev, November 16-17, 1972: Forest Service General Technical Report RM-3, September 1973.

Descriptors: *Avalanches, *Snowpacks, Stress, Strain, Conferences, Explosives, Failure (Mechanics), Strength, Density, Elasticity (Mechanical), Creep, Deformation, Forecasting.
Identifiers: *Snow mechanics.

As part of its National Avalanche Training Program, the USDA Forest Service hosted a symposium at Reno, Nevada, on November 16 and 17, 1972. The opening contribution by W. St. Lawrence and C. Bradley reports on acoustic signals emitted by snow under stress. One breakthrough is mentioned-the discovery of the Kaiser acoustic effect in snow. St. Lawrence and Bradley envision that acoustic emission phenomena, including the Kaiser effect, amay have important applications for testing the struc-

tural integrity of avalanche slopes. The next four contributions discuss various aspects of snow slab mechanics. This research is motivated by needs of the ski industry to control the slab avalanche problem. Since the basic mechanics of slab release are unknown, many uncertainties exist about how to artifically release slab avalanches with explosives. The paper by M. Mellor is a start in explaining how explosives can be used rationally and systematically in avalanche technology. Canadian research, however, has looked into the problems of avalanche dynamics. In a brief report P. A. Schaerer presents a practical way of computing impact pressure of moving avalanches. (See W74-02741 thru W74-02747) (Knapp-USGS)

ULTRASONIC EMISSIONS IN SNOW,
Montana State Univ., Bozeman. Dept. of Earth Sciences.
W. St. Lawrence, and C. Bradley.
In: Proceedings of USDA Forest Service National Avalanche Training Program, Reno, Nev, November 16-17, 1972: Forest Service General Technical Report RM-3, p 1-6, September 1973. 3 fig, 6 ref. Army Grant DA-ARO-D-31-124-71-G59.

Descriptors: *Acoustics, *Snowpacks, *Avalanches, *Sound waves, *Ultrasonics, Stress, Strain, Slopes, Snow cover, Failure (Mechanics), Deformation.
Identifiers: *Snow mechanics.

Burst-type acoustic signals were monitored in snow subjected to various load and deformation histories over a wide range of frequencies. The pattern of the acoustic response is closely related to the particular load or deformation history applied. Examination of the emission pattern suggests a description of the deformation of snow in terms of a structural mechanism. A possible application of the acoustic emission technique is making in situ measurements of the state of stress in an active snow slope. These measurements may be useful for use in predicting and controlling avalanches. (See also W74-02740) (Knapp-USGS)
W74-02741

INCORPORATION OF GLIDE AND CREEP MEASUREMENTS INTO SNOW SLAB MECHANICS,
Washington Univ., Seattle. Dept. of Civil Engineering.
C. B. Brown, R. J. Evans, and D. McClung.
In: Proceedings of USDA Forest Service National Avalanche Training Program, Reno, Nev, November 16-17, 1972: Forest Service General Technical Report RM-3, p 7-13, September 1973. 3 fig, 7 ref.

Descriptors: *Avalanches, *Snowpacks, *Creep, *Shear, Stress, Strain, Slopes, Snow cover, Strength of materials, Failure (Mechanics), Deformation.
Identifiers: *Snow mechanics.

The conventional field measurements in slab avalanche control include snow strength, creep, and glide. On a gliding interface in the snow material a continuous process involves healing and fracture, associated with regelation. Creep speeds are of the same order as glide speeds. Both features are therefore equally important in any analytical formulation. One avenue of avalanche prediction concerns the attenuation of basal shear capacity. With regelation and a steady rate of strain over a substantial total interface area, some part of the interface will be melted and some frozen. Additionally, separation may occur. Averaged over the interface, this will account for some regions slipping locally and some just on the point of slipping. When the glide speed increases with no additional evidence of increase in snow strength, then conditions of incipient avalanching should be expected. (See also W74-02740) (Knapp-USGS)
W74-02742

MATERIAL PROPERTY AND BOUNDARY CONDITION EFFECTS ON STRESSES IN AVALANCHE SNOWPACKS,
Colorado State Univ., Fort Collins. Dept. of Mechanical Engineering.
J. O. Curtis, and F. W. Smith.
In: Proceedings of USDA Forest Service National Avalanche Training Program, Reno, Nev, November 16-17, 1972: Forest Service General Technical Report RM-3, p 14-23, September 1973. 8 fig, 4 ref.

Descriptors: *Avalanches, *Simulation analysis, *Stress, *Snowpacks, Computer programs, Strain, Shear, Deformation, Finite element analysis, Failure (Mechanics), Mathematical models, Strength of materials, Youngs modulus, Shear strength, Tensile strength.
Identifiers: *Snow mechanics.

A mathematical model was developed for the prediction of stresses and displacements in an avalanche snowpack. The finite element model only accounts for elastic effects and therefore ignores the realistic effects of creep and plasticity. In spite of this limitation a considerable amount of insight to the stress distribution may be gained by such analysis. The analytical model was applied to a multilayered snowpack on Berthoud Pass, Colorado. The finite element computer program, utilizing triangular constant strain elements, was applied with the following assumptions: plain strain conditions exist in the snowpack; the top surface is stress free; each layer is isotropic; and a constant value of Young's modulus and Poisson's ratio exists throughout the snowpack. Layers of variable density snow influence the variation of stresses as a function of depth. Density will play an even greater part when Young's modulus and Poisson's ratio are made functions of this parameter. A shear failure in the bottom layer of snow below an observed fracture line was predicted by the model. Post-release investigations of the actual snowpack revealed that such a failure did take place. Through shear failure simulation, large tensile stresses parallel to the snow surface can be predicted within the top layer of snow. This condition might lead to tensile failure in the critical region. Field observation verified such an occurrence. (See also W74-02740) (Knapp-USGS)
W74-02743

ON THE MECHANICS OF THE HARD SLAB AVALANCHE,
Montana State Univ., Bozeman. Dept. of Civil Engineering and Engineering Mechanics.
T. E. Lang, and R. L. Brown.
In: Proceedings of USDA Forest Service National Avalanche Training Program, Reno, Nev, November 16-17, 1972: Forest Service General Technical Report RM-3, p 24-28, September 1973. 3 fig, 10 ref.

Descriptors: *Avalanches, *Snowpacks, *Creep, *Buckling, *Shear, Stress, Strain, Slopes, Snow cover, Strength of materials, Failure (Mechanics), Deformation.
Identifiers: *Snow mechanics.

The buckling of snow slabs is proposed as a failure mechanism of avalanche slopes. Buckling may initiate and grow under a wide range of conditions. Using a simplified analytical model and nominal material properties, the times computed for buckle mode growth are at least of the same order as times associated with the avalanche phenomenon. The possiblity exists for void formation and growth, depending upon the relative rates of snowpack settlement and slope-parallel creep, coupled with the necessity of a structurally weakened basal-plane zone. (See also W74-02740) (Knapp-USGS)
W74-02744

STATISTICAL PROBLEMS IN SNOW MECHANICS,
Forest Service USDA, Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
R. A. Sommerfeld.
In: Proceedings of USDA Forest Service National Avalanche Training Program, Reno, Nev, November 16-17, 1972: Forest Service General Technical Report RM-3, p 29-36, September 1973. 4 fig, 1 tab, 14 ref.

Descriptors: *Avalanches, *Snowpacks, *Statistics, *Statistical methods, Density, Water equivalent, Strength, Tensile strength, Shear strength, Failure (Mechanics), Deformation.
Identifiers: *Snow mechanics.

Different types of statistical treatments are appropriate for evaluating measurements of different physical properties of snow. For density measurements, the mean and standard deviation of the measurements are meaningful parameters. In the case of strength measurements, the mean is not a very useful parameter, and some type of extreme-value statistics should be used. Weibull statistics appear to be appropriate for tensile strength data, while the thread bundle statistics of Daniels appear appropriate for the evaluation of shear strength data. (See also W74-02740) (Knapp-USGS)

W74-02746

OBSERVATIONS OF AVALANCHE IMPACT PRESSURES,
National Research Council of Canada, Ottawa, (Ontario). Div. of Building Research.
P. A. Schaerer.
In: Proceedings of USDA Forest Service National Avalanche Training Program, Reno, Nev, November 16-17, 1972: Forest Service General Technical Report RM-3, p 51-54, September 1973. 2 fig, 1 tab, 3 ref.

Descriptors: *Avalanches, *Pressure, Flow, Loads (Forces), Density, Velocity.
Identifiers: *Snow mechanics.

Observations were made of impact pressures produced by well developed dry snow avalanches. There is a strong variation of pressure during the passage of an avalanche. For practical purposes the impact pressure produced by dry snow avalanches is proportional to the square of the speed of the avalanche front and to the density of the deposited snow. SNOWMELT LYSIMETERS PERFORM WELL IN COLD TEMPERATURES IN CENTRAL COLORADO,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
R. W. Schultz.
USDA Forest Service Research Note RM-247, September 1973. 8 p, 1 tab, 8 fig, 9 ref.

Descriptors: *Snowmelt, *Lysimeters, *Rocky Mountain Region, Instrumentation, Measurement, Watersheds (Divides), Winter, Temperature, Seasonal, Water types, Water sources, Costs.

The snowmelt lysimeter designed by H. F. Haupt (1969) has performed well in northern Idaho forests where relatively mild winter temperatures prevail. Compared with snow-tube measurements of melt rates, it provided reliable data on snowmelt also in the central Rocky Mountains under severe winter conditions, when field-tested above 3000 m altitude on the West St. Louis Creek watershed. The design and operation of the lysimeter are described. The cost of materials for each unit is estimated below $100, excluding the water level recorder. (Brown-IPC)

A STUDY OF EVAPOTRANSPIRATION FROM A DOUGLAS FIR FOREST USING THE ENERGY BALANCE APPROACH,
British Columbia Univ., Vancouver. Dept. of Soil Science.
K. G. McNaughton, and T. A. Black.
Water Resources Research, Vol 9, No 6, p 1579-1590, December 1973. 4 fig, 1 tab, 27 ref.

Descriptors: *Evapotranspiration, *Interception, *Forests, *Water balance, *Energy budget, Douglas fir trees, Winds, Evaporation, Transpiration.

Energy balance measurement of evapotranspiration from a young Douglas fir forest were made in a period of 18 days in July 1970 when soil water was not limiting. Peak daily evapotranspiration rates characteristically occurred 2-3 hours after solar noon, and evapotranspiration showed a short-term independence from net radiation. This behavior is as a consequence of the large forest roughness. Daily evapotranspiration and net radiation were well correlated. Values of surface diffusion resistance were calculated from Monteith's combination formula. Daytime values showed significant day-to-day differences, and an attempt to define a potential evapotranspiration rate by assuming a constant daytime surface resistance was not successful. Comparison of evapotranspiration measurements with a potential evaporation formula for wet surfaces developed by Priestley and Taylor suggests that evaporation of intercepted water proceeds 20% more rapidly than evapotranspiration from the nonwetted canopy. (Knapp-USGS)
W74-02764

FOREST TRANSPIRATION GREATLY SPEEDS STREAMFLOW RECESSION,
Forest Service (USDA), Durham, N.H. Northeastern Forest Experiment Station.
C. A. Federer.
Water Resources Research, Vol 9, No 6, p 1599-1604, December 1973. 3 fig, 2 tab, 12 ref.

Descriptors: *Transpiration, *Recession curves, *Base flow, *Rainfall-runoff relationships, Evapotranspiration, Water balance, Hydrologic budget, Forests, Temperature, Hydrograph analysis.
Identifiers: Hubbard Brook experimental watershed.

Streamflow recessions from a 42-ha forested watershed in New Hampshire are greatly affected by transpiration. In the dormant season, recession flow continues for many days at rates around 1 mm/day, whereas, in the growing season, streamflow rate declines in several days to less than 0.05 mm/day. Transitions between the two regimes occur in June and late September or early October, corresponding to the leaf out and color change phenology of the area. Elimination of transpiration by cutting and herbiciding a 16-ha watershed changed the rate of its summer recession from the rapid decline associated with transpiration to the slow recession characteristic of no transpiration. The recession without transpiration is probably maintained by slow drainage of unsaturated soil, since groundwater exists only during snowmelt on these steep watersheds. Rapid recession occurs when transpiration over the whole watershed removes soil water that would otherwise drain and become streamflow. (Knapp-USGS)
W74-02766

UNSATURATED FLOW PROPERTIES USED TO PREDICT OUTFLOW AND EVAPOTRANSPIRATION FROM A SLOPING LYSIMETER,
Forest Service (USDA), Tempe, Ariz. Forest Hydrology Lab.
D. G. Scholl, and A. R. Hibbert.
Water Resources Research, Vol 9, No 6, p 1645-1655, December 1973. 12 fig, 6 ref.

Descriptors: *Unsaturated flow, *Evapotranspiration, *Lysimeters, Hydraulic conductivity, Water balance, Soil water movement, Soil moisture, Rainfall-runoff relationships, Hydraulic models, Model studies.

Field measurements of soil moisture content and pressure potential were used to determine the moisture flux, hydraulic gradients, and dynamic conductivity of a 200-foot sloping soil lysimeter. These measurements were then used to predict outflow and evapotranspiration. A vertical unsaturated Darcian analysis was used to evaluate conductivity during the first study phase, in which evapotranspiration was eliminated by sealing the model surface with a plastic sheet. The moisture flux term in the Darcy equation was determined by evaluating moisture content change in depth and time. Moisture flux determined in this way agreed with measurements of actual outflow. Conductivities were solved from flux and hydraulic gradients and corresponding water contents were assigned. Conductivity curves were highly significant and agreed with those obtained when the model was uncovered. Evapotranspiration was solved during the second study phase (cover removed and grass established) by using a water balance based on moisture content and potential, rainfall, and conductivity (from the first study phase). Results at the deepest level in the profile agreed well with those based on actual outflow. (Knapp-USGS)

COMPARATIVE TRANSPIRATION STUDIES OF SOME CAPE PROTEAS,
Cape Town Univ. (South Africa). Dept. of Botany.
K. H. Schutte.
South African Journal of Science, Vol 69, No 2, p 57-58, February, 1973. 1 fig, 2 tab, 2 ref.

Descriptors: *Transpiration, *Specific conductivity, Measurement.
Identifiers: *Proteas.

The transpiration and specific conductivity of 16 species of Protea were measured for the first time in the laboratory. Twigs cut from comparable one year old branches which had stood in water overnight were placed in flasks of water whose surface was then covered with oil. Leaf area was then determined. The flasks were then placed in controlled transpiration chambers and the transpiration at various temperatures between 20C and 45C was determined as the rate of loss of weight of the flasks per unit leaf area. The relative humidity was maintained at 75 plus or minus 3%. For reasons unknown the transpiration rate of some specimens proved to be much more temperature - dependent than that of the others. The specific conductivity, defined as the volume of water conducted by 1 cm 2 of wood in a 15 cm long twig in 15 minutes, was then determined for 8 Protea species using Farmer's method. Considerable variation was found between species, and for the same species at different times. Some of the Proteas had conductivities characteristic of evergreens, the others being intermediate between the conductivities of evergreens and deciduous plants. (DWA)

Israel Journal of Agricultural Research, Vol 22, No 2, p 99-107, July 1972. 2 figs, 1 tab, 13 refs.

Descriptors: Air temperature, *Heat transfer, Radiation, *Heat flow, Turbulence, Environmental effects, Condensation, *Micrometeorology, Soil temperature, *Diurnal, *Nocturnal, Meteorology.
Identifiers: *Israel, Sensible heat flux.

In addition to calculating the horizontal and vertical components of the wind and other quantities of interest in dynamic meteorology, the author and Y. Mahrer have calculated some quantities of interest in micrometeorology, e.g. the vertical flux of sensible heat to and from the ground. Results of a theoretical computation of the vertical heat transfer to and from the central coastal plain of Israel are related to net radiation balance measurements conducted by the Israel Meteorological Service. By linking the aforementioned two fluxes, estimates are formed of the vertical flux of sensible heat in the soil. Processes of evaporation/condensation from the plain as a whole are believed to be unimportant in summer. Results suggest that the diurnal cycle can be divided into four phases according to the direction of the heat fluxes of sensible heat in air, and sensible heat in soil. Computations for daylight hours work out satisfactorily. Although the resulting value for the alternating heat storage is reasonable, the hour-to-hour balances, as distinct from the balance for three daylight phases, are not good. The balance for the night hours is not satisfactory and the most likely

cause of this imbalance lies in the fact that the physics of turbulent transfer under highly stable conditions is not understood, even to the limited extent which applies to other conditions of static stability. (Black-Arizona)

AN INVESTIGATION OF THE DEFORMATION AND BREAKING OF SOLITARY WAVES,
Stanford Univ., Calif. Dept. of Civil Engineering.
F. E. Camfield, and R. L. Street.
Available from NTIS as AD-664 249, $6.00 in paper copy. Technical Report No 81, December 1967. 132 p, 30 fig, 36 ref, 2 append. Nonr-225 (85), NR 089-041.

Descriptors: *Beaches, *Waves (Water), Bores, Deformation, *Profiles.
Identifiers: *Shoaling, *Solitary waves, Wave run-up, Wave generation, *Breakers.

It is proposed that solitary waves can be used as the initial wave shape to simulate the shoaling, breaking and run-up of large, long waves on a beach. Experiments were conducted with solitary waves to determine criteria for wave growth, celerity, breaking height and run-up on various beach slopes. In addition, limited investigations were made of reflected bores, effects of variations in the bottom profile, and the effect of multiple slopes, i.e., one slope followed by a second, higher slope, on the breaking and run-up of solitary waves. Further considerations are given to the method of characteristics as a means of analyzing shoaling waves. A qualitative analysis is presented of the effect of vertical acceleration terms on the solution. A comparison is made with other analytical solutions for shoaling waves. The experimental results are tabulated and plotted comparisons of the experimental results and the various analytical methods for shoaling waves are presented. It is concluded that the present analytical methods do not adequately represent shoaling solitary waves and current design criteria for breaking heights and run-up of waves need to be improved. INVESTIGATIONS OF MARINE PROCESSES AND COASTAL LANDFORMS NEAR CRESCENT CITY, CALIFORNIA. VOLUME I. TECHNICAL DISCUSSION,
Atmospheric Research Group, Altadena, Calif.
J. A. Roberts, D. M. Bleistein, and R. Dolan.
Available from NTIS as AD-655 007, $6.00 in paper copy. Final report prepared for Army Natick Laboratories, Earth Sciences Division, July 1967. 83 p, 48 fig, 36 ref, 3 maps. DA 19-129-AMC-684 (N).

Descriptors: *California, *Beaches, Geomorphology, Winds, *Waves (Water), Tides, Profiles, Seasonal, *Sedimentation.
Identifiers: Crescent City (Calif), Littoral currents.

Results are presented of a study of the dynamics of South Beach located adjacent to Crescent City, California. The objectives were twofold: (1) to relate the beach dynamics to the overall morphology of the Smith River Plain, the region in which the beach is situated, and (2) to develop techniques to accomplish the study. The Smith River Plain is a lowland segment of the Klamath Mountains Province. The structure of the Plain is controlled by diastrophism. The general configuration of the Plain is controlled by location, orientation, and exposure of bedrock. To conduct the study within the scope of the project necessitated the selection of several key sites and the utilization of specialized sampling techniques for seasonal profiling and for short, intensive study. South Beach is an arcuate beach, about four miles in length, composed principally of medium to fine grained sands. The beach reflects only minor seasonal or tidal variability, and its configuration is controlled by its exposure to wave forces by local geomorphology. (Sinha-OEIS)

WATER WAVE RUN-UP ON A BEACH,
Service Bureau Corp., New York.
J. B. Keller, and H. B. Keller.
Available from NTIS as AD-608 864, $6.00 in paper copy. Research Report, June 1964. 21 p, 5 fig, 1 tab, 6 ref, 1 append. NONR-3828 (00).

Descriptors: *Shallow water, *Waves (Water), Tsunamis.
Identifiers: *Wave run-up, Linear theory, *Incident waves, *Bottom slope.

While investigating the Tsunami wave project, a numerical method was devised to solve the initial boundary value problem for the equations of the non-linear shallow water theory. The case of one horizontal dimension was considered in a domain bounded by a shore at one end, with the motion of the shoreline taken into account. In addition, this method enabled the incident wave to be introduced at the seaward end of the domain. The water was assumed to be at rest in the domain until the incident wave arrived, and the bottom was assumed to slope uniformly. (Sinha-OEIS)

ENERGY MEASUREMENTS IN THE SWASH--SURF ZONE,
University of Southern California, Los Angeles. Dept. of Geology.
A. Schiffman.
Limnology and Oceanography, Vol 10, No 2, p 255-260, April 1965. 6 fig, 1 tab, 7 ref.

Descriptors: *Energy, *Beaches, Sediments, *Waves (Water), Sampling, Surf, *Dynamometers, Flow, Instrumentation.
Identifiers: Breaker zone, Swash, *Fluid flow.

A technique has been devised for obtaining energy and sediment data in the swash-surf zone of a beach. The instruments used are a bidirectional compression spring dynamometer and a rapid surface sand sampler that have been designed specifically for use shoreward of the breakers. On the basis of the information gathered to date, three distinct depositional environments have been defined inside the breaker zone. These are: (1) the swash zone, (2) the surf zone, and (3) a well defined transition zone separating the first two. (Sinha-OEIS)

BREAKER TYPE CLASSIFICATION ON THREE LABORATORY BEACHES,
Army Coastal Engineering Research Center, Washington, D.C.
C. J. Galvin, Jr.
Journal of Geophysical Research, Vol 73, No 12, p 3651-3659, June 15, 1968. 6 fig, 7 tab, 23 ref.

Descriptors: *Waves (Water), *Beaches, *Hydrodynamics, Coasts.
Identifiers: *Breakers, Spilling breakers, Plunging breakers, Collapsing breakers, Surging breakers.

Breaker types on three laboratory beaches are quantitatively classified. This classification is made empirically by correlating dimensionless steepness parameters, based on wave height, wave period, and beach slope, with the breaker type obtained from films of a wide range of conditions. Breaker type, for waves on smooth concrete slopes depends on beach slope, wave period, and either deep-water or breaker height. For forty-three varied laboratory conditions, breaker type can be sorted fairly well by either of two dimensionless combinations of these variable, an offshore parameter, or an inshore parameter. As either of these parameters increases, breaker type changes from surging or collapsing to plunging to spilling. For the offshore and inshore parameters, respectively, the surge-plunge transition values are about 0.09 and 0.003 and the plunge-spill transition values are about 4.8 and 0.068. The deep-water heights in the offshore parameter were computed from linear, wave-generator theory. Breaker type data were obtained from films of breaking waves for conditions that produced a dominant breaker type, free from interference by secondary waves. (Sinha-OEIS)

A NUMERICAL MODEL OF COASTAL UPWELLING,
National Center for Atmospheric Research, Boulder, Colo.
J. J. O'Brien, and H. E. Hurlburt.
Journal of Physical Oceanography, Vol 2, No 1, p 14-26, January 1972. 19 fig, 1 tab, 22 ref.

Descriptors: *Coasts, *Upwelling, Stratification, *Model studies, *Water circulation, Continental shelf, *Oregon.
Identifiers: Numerical models, Baroclinic surface jet, *Wind stress, *Pynocline, Ekman drift.

A wind-driven model of coastal upwelling induced into a stratified, rotating ocean is solved numerically. The circulation is on an f plane and longshore variations are neglected. A multilevel model is derived, but only solutions for a two-layer model are discussed. A longshore baroclinic surface jet is discovered. The time-dependent geostrophic jet is dynamically explained by conservation of potential vorticity. The existence of the jet depends critically on stratification and non-zero wind stress at the coast. Coastal upwelling is confined to within 30 km of the shore. The model exhibits no deep countercurrent during active coastal upwelling. A time scale of the order of 10 days or longer is required for a pycnocline at 50 m depth to penetrate the surface. Solutions for a wide coastal shelf, an irregular shallow shelf, and a continental slope region are illustrated. A secondary upwelling region is found offshore at sharp breaks in the shelf topography. In all cases, the offshore flow is a simple Ekman drift and downd-

welling offshore is created by Ekman pumping caused by negative wind-stress curl. (Sinha - OEIS)

INVESTIGATION OF CORRELATION OF ANNUAL RUNOFF FOR APPALACHIAN RIVERS (ISSLEDOVANIYE KORRELYATIVNOY SVYAZI GODOVOGO STOKA APPALACHSKIKH REK),
Moscow State Univ. (USSR). Dept. of Hydrobiology.
V. N. Busarov.
Vestnik Moskovskogo Universiteta, Seriya V, Geografiya, No 3, p 102-105, May-June 1973. 2 fig, 5 ref.

Descriptors: *Runoff, *Annual, Rivers, Mountains, *Correlation analysis, Variability, Seasonal, Maps, *Appalachian mountain region.
Identifiers: USSR.

Investigation of relation of annual runoff of mountain streams in different regions of the Appalachians has revealed the presence of zones of synchronous and asynchronous runoff. A change in the coefficient of correlation is irregular in all directions from the sample river. Areas of close correlation of annual runoff, bounded by isocorrelates 0.9, 0.8, and 0.7, can be identified about the sample rivers. The boundary of the isocorrelates does not correspond to the boundaries of individual river basins but encompasses larger areas. Rivers in the four regions bounded by isocorrelate 0.7 have a synchronous seasonal runoff distribution with the sample river and with each other. Rivers in other regions differ significantly in seasonal variation of runoff. Correlative association of annual runoff can be used to divide an area into hydrologic regions. (Josefson-USGS)

ROLE OF DEPTH OF CHANNEL DOWNCUTTING IN THE FORMATION OF LOW FLOW IN MOUNTAIN STREAMS (ROL' GLUBINY VREZA RUSEL V FORMIROVANII MAZHENNOGO STOKA GORNYKH REK),
Moscow State Univ. (USSR). Dept. of Hydrobiology.
V. M. Mikhaylov.
Vestnik Moskovskogo Universiteta, Seriya V, Geografiya, No 3, p 98-102, May-June 1973. 2 fig, 1 tab, 2 ref.

Descriptors: *Low flow, *Channel morphology, *Streams, *Mountains, Elevation, Watersheds (Basins), Hydrogeology.
Identifiers: *USSR (Pamirs-Tien Shan).

Investigation of the relation of low-flow runoff to basin elevation was based on water-regime data and morphometric parameters for 53 streams in the Pamirs and Tien Shan. On the basis of low flows and channel morphology, the area was divided into three regions: (1) southwestern part of the Pamir-Alay Mountains; (2) Western Tien Shan; and (3) Inner Tien Shan (excluding the Issyk-Kul' Depression) and the Eastern Pamirs. An increase in low flow with increasing basin elevation is observed only to certain heights, after which an increase in elevation is accompanied by reduced low flows. Hydrogeological conditions in a basin have a significant effect on low-flow values. (Josefson-USGS)

KARST WATERS OF THE CAUCASUS (KARSTOVYYE VODY BOL'SHOGO KAVKAZA),
L. A. Vladimirov, and G. N. Gigineyshvili.
Vsesoyuznoye Geograficheskoye Obshchestvo Izvestiya, Vol 105, No 4, p 358-362, July-August 1973. 3 ref.

Descriptors: *Karst, *Karst hydrology, *Mountains, Groundwater, Subsurface drainage, Limestones.
Identifiers: *USSR, *Caucasus, Karst processes, Karst springs, Karst lakes.

In hydrographic features and conditions of supply, karst waters of the Caucasus are divided into springs, underground streams, intermittent underground-surface streams, surface streams that reflect the influence of karst processes, and karst lakes. Karst springs are abundant in the eastern part of the Western Caucasus, where karst processes are strongly developed on the Arabika, Rikhva, Bzybi, and Okhachkuye massifs. The largest springs in the Caucasus are the Mchishta Spring which has an average annual discharge of 9,500 liters a second and the Kyafar-Agur Spring which has an average annual discharge of 7,500 liters a second. Fifty springs on the southern slope of the Caucasus have a discharge exceeding 100 liters a second. Of these, only 3 (Apenistskaro, Patmasuri, and Zinobani) are located in the Eastern Caucasus, while the remainder are almost evenly divided between the Western and Middle Caucasus. Underground karst streams are divided into streams that obtain their supplies from a karst basin; streams formed by interception; and streams formed as a result of total collapse of the surface stream. Three types of surface karst streams are found in mountainous areas: (1) small streams formed from karst springs; (2) small streams which are a surface continuation of an underground stream; and (3) small streams formed outside a karst region but whose discharge and regimen are influenced by karst processes. The number of karst lakes in the Caucasus is small. (Josefson-USGS)

DISPERSAL PROCESSES OF FRESHWATERS IN THE PO RIVER COASTAL AREA,
Osservatorio Geofisico Sperimentale, Trieste (Italy).
G. Grancini, and B. Cescon.
Limnology and Oceanography, Vol 18, No 5, p 705-710, September 1973. 6 fig, 2 tab, 17 ref.

Descriptors: *Dispersion, *Saline water-freshwater interfaces, Mixing, Salinity, Density stratification, Saline water intrusion, Estuaries.
Identifiers: Po River (Italy).

Tidal effects on the vertical structure and dynamic pattern of freshwater plume in the Po River coastal area were evaluated. A large vertical density gradient just below the surface and a lateral density front separate the fresh and seawaters. The horizontal extent of the river waters was traced by analyzing nitrates. The effluent from the Po River produces in the coastal area a surface pool of low salinity water that is moved by wind, tidal, and hydraulic forces. Changes of the vertical structure resemble an internal tidal wave. (Knapp-USGS)

USE OF CENSORED DATA IN THE ESTIMATION OF GUMBEL DISTRIBUTION PARAMETERS FOR ANNUAL MAXIMUM FLOOD SERIES,
Institute of Hydrology, Wallingford (England).
M. N. Leese.
Water Resources Research, Vol 9, No 6, p 1534-1542, December 1973. 2 tab, 10 ref, append.

Descriptors: *Floods, *Statistics, *Statistical methods, *Data collections, *Sampling, Probability, Flood forecasting, Flood recurrence interval, Flood data, Flood frequency.

Maximum likelihood equations for the estimation of Gumbel distribution parameters from censored samples are derived, and expressions for their large sample standard errors are given. Censored samples arising in annual maximum flood series are described, and it is shown that a set of historic floodmarks may, under certain assumptions, be combined with recent noncensored data, to form what is essentially a censored sample. Maximum likelihood methods are applied to such a sample and the resulting estimates are compared with those obtained from the recent data alone. The estimates agree closely, and the use of the extra information contained in the historic floodmarks is shown to lead to a reduction in the large sample standard errors of the estimates. APPLICATION OF THE IMPLICIT METHOD TO SURGES IN OPEN CHANNELS,
Rummel, Klepper and Kohl, Baltimore, Md.
Y. M. Chaudhry, and D. N. Contractor.
Water Resources Research, Vol 9, No 6, p 1605-1612, December 1973. 8 fig, 17 ref.

Descriptors: *Open channel flow, *Surges, *Waves (Water), Numerical analysis, Gradually varied flow, Unsteady flow, Bores, Seiches, Finite element analysis.

A technique is proposed by which continuous numerical computation of flows with surges in open channels can be handled with an implicit formulation. The one-dimensional gradually varied flow equations of continuity and momentum are written in finite difference form. A computer program was written to solve the problem in which the discharge hydrograph is given at the upstream end of a channel and a stage-discharge relationship is specified at the downstream end. This program was applied to different flow situations in laboratory channels and natural rivers. A weighting parameter (theta) ± 0.5 produced results with a steep wave front but with considerable numerical instability. The use of theta ± 1.0 gave results with considerable diffusion of the wave front. The use of theta ± 0.60 produced results that had a steep wave front and only a minor degree of numerical instability. This value of theta resulted in good agreement between calculated and measured hydrographs at the downstream end of the channel in most applications. However, the optimum value of theta depends on channel friction and the steepness of the wave front. (Knapp-USGS)

COMPARISON OF METHODS OF DERIVING UNIT HYDROGRAPHS,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
K. Jawed.
Available from the National Technical Information Service as PB-226 571 $11.25 in paper copy, $1.45 in microfiche. M Sc Thesis, August 1973. 166 p, 26 fig, 15 tab, 72 ref, 6 append. OWRR B-064-COLO (8), Agreement A-31-001-3565.

Descriptors: *Rainfall-runoff relationships, *Streamflow forecasting, *Hydrographs, Methodology, Model studies, Correlation analysis, Evaluation, Storm runoff, Peak discharge, Watersheds (Basins), Hydrology.

The suitability of using various methods for deriving unit hydrographs for small rural watersheds was investigated. The flood events were selected from the Colorado State University small watershed data file. The catchment areas for the watersheds in the data file range from 0.1 to 40 square miles. Two approaches--parametrid system synthesis (routing techniques) and nonparametric system analysis (convolution techniques) were used. The routing techniques give nonoscillating unit hydrographs which are physically realizable. The peak rate of discharge and the time to peak are well defined by these methods. Thus, these parameters can be better used for further studies, such as correlations with watershed parameters, sensitivity to storm characteristics, etc. (Woodard-USGS)

RIVERS AS DYNAMIC SYSTEMS,
Army Engineer District, Vicksburg, Miss.
B. R. Winkley, D. B. Simons, and S. A. Schumm.
American Society of Civil Engineers Task Committee Report, New York, January 1973. 24 p, 3 fig, 39 ref.

Descriptors: *Rivers, *Potamology, *River flow, *Geology, *Geography, Geomorphology, Meanders, River beds, Streams, Dynamics.
Identifiers: *River system dynamics.

A river is frequently considered to be static in shape, dimension, pattern and location; while in actuality, an alluvial river is generally continuously changing its character. The movement of a river can be caused either by natural conditions or by changes brought about by man. Both types of changes are governed by the same basic forces and the river engineer should have competent knowledge about: (1) geological factors, including soil conditions; (2) hydrologic factors, including impending changes in flows, runoff, and possible effects of changes in land use; (3) geometric characteristics of the stream; and (4) hydraulic characteristics of streams. Although most stream changes will be gradual, movements of stream beds at a rate of 2,500 feet per year have been recorded. Even for the Mississippi River, rates of 630 feet a year have been noted near Rosedale, Mississippi. River movement on a certain stream, at a specific location, may vary considerably over a period of years. Mathematical modeling of river dynamics provides a method of predicting both short-term and long-term time changes. Practical solutions involve mathematical modeling; further development of these models should increase their usefulness. (Poertner)

CURRENTS AND WATER MASSES,
Ministry of Agriculture, Fisheries and Food, Lowestoft, (England).
H. W. Hill.
In: North Sea Science; Proceedings of NATO North Sea Science Conference, November 15-20, 1971, Aviemore, Scotland: Massachusetts Institute of Technology, p 17-42, 1973. 12 fig, 27 ref.

Descriptors: *Ocean currents, *Currents (Water), Thermal stratification, Oceanography, *Ocean circulation, Data collections, Density stratification, Tides.
Identifiers: *North Sea, Water masses.

The three primary and five secondary water masses in the North Sea are the North Atlantic, Channel, and Skagerrak (primary) and Scottish Coastal, English Coastal, Continental Coastal, Northern North Sea, and Central North Sea (secondary). The main influx probably occurs during the months of September to February. All but the Skagerrak water mass occupy the whole water column. In general, the northern North Sea, away from the coastal areas, is thermally stratified in summer, and in the Skagerrak and eastern and central North Sea there is seasonal or annual haline stratification. The main inflows are from the north, through the Straits of Dover and from the Baltic, while the main outflow is probably along the Norwegian coast. Some eddy systems are probable between these major streams. Bottom currents are broadly similar, but a seasonal variability is evident around the southwest Dogger Bank and towards the Lincolnshire coast. Recent current measurements suggest that there is a considerable degree of variability in space and time in surface and subsurface residuals. (Knapp-USGS)

THE SURFACE WATERS OFF THE COAST OF KERALA, SOUTH-WEST INDIA,
M. Darbyshore.
Deep-Sea Research, Vol 14, p 295-320, June 1967. 28 fig, 9 ref, append.

Descriptors: *Thermocline, *Seasonal, *Salinity, *Currents (Water), Freshwater, Coasts, *Monsoons, Hydrography, Sea Water.
Identifiers: *India (Kerala), Arabian Sea Water, Equatorial Sea Water, Water masses.

The surface waters between the coast of Kerala and the meridian 72 degrees E are studied. T-S diagrams and temperature-depth profiles are drawn. A sharp thermocline is found to be associated with the Arabian Sea Water. This occurs immediately below the surface in summer, but in winter the upper limits sink to a depth of about 100 m and the top layer is occupied by a water mass of considerably lower salinity which is termed here Equatorial Surface Water. The movements of this water mass can be correlated with the current system of the north equatorial region. During the latter part of the monsoon season and for a few weeks afterwards, there is a very strong flow of fresh water from the backwater which extend seawards as as tongues of a very low salinity water at the surface. The effect of the freshwater influx on the annual salinity pattern is discussed. (Sinha-OEIS)

DRAWDOWN DISTRIBUTION DUE TO WELL FIELDS IN COUPLED IN COUPLED LEAKY AQUIFERS, 1. INFINITE AQUIFER SYSTEM,
Illinois Univ., Chicago. Dept. of Geological Sciences.
Z. A. Saleem, and C. E. Jacob.
Water Resources Research, Vol 9, No 6, p 1671-1678, December 1973. 1 fig, 14 ref.

Descriptors: *Drawdown, *Artesian aquifers, *Aquifer systems, Leakage, Mathematical studies, Equations, Aquifer characteristics, Confined water.
Identifiers: *Leaky artesian aquifers.

Solutions for drawdown distribution caused by the pumping of well fields in single aquifers were obtained for a limited number of cases. However, most of the aquifers in nature are not single isolated aquifers. Consequently, the use of presently available solutions can yield unreasonable results. Equations for the drawdown distribution caused by the pumping of well fields in two coupled leaky aquifers are presented. Two cases of the system are analyzed. Case 1 is the upper aquifer when it is confined or unconfined and the drawdown in it is very small in comparison with its saturated thickness; in case 2 the drawdown in the upper unconfined aquifer can be significant. Approximate solutions for relatively short and long times, as well as solutions for special cases, are presented. The solutions involve integrals that can be evaluated by using a digital computer. GROUND-WATER BASIC DATA FOR GRIGGS AND STEELE COUNTIES, NORTH DAKOTA,
Geological Survey, Bismarck, N.Dak.
J. S. Downey, R. D. Hutchinson, and G. L. Sunderland.
North Dakota State Water Commission County Ground-Water Studies 21--Part II, and North Dakota Geological Survey Bulletin 64--Part II, 1973. 468 p, 2 fig, 4 tab, 25 ref.

Descriptors: *Groundwater resources, *Hydrogeology, *Well data, *Water quality, *North Dakota, Aquifer characteristics, Water wells, Lithologic logs, Water levels, Chemical analysis, Basic data collections, Hydrologic data.
Identifiers: *Griggs and Steele Counties (ND).

Data on the hydrologic investigation in Griggs and Steele Counties, N. Dak., were collected chiefly between 1969 and 1972, and consists of the following: (1) geologic and hydrologic data for 1,190 wells and test holdes; (2) water-level measurements in 155 observation wells; (3) lithologic and geophysical logs of 414 test holes and wells; and (4) chemical analyses of 297 water samples. The mineral constituents and physical properties of water include the concentrations of silica, iron, manganese, calcium, magnesium, sodium, potassium, bicarbonate, carbonate, sulfate, chloride fluoride, nitrate, boron, and dissolved solids. Values for hardness, noncarbonate hardness, sodium-adsorption ratio, percent sodium, specific conductance, pH, and water temperature are also given. (Woodard-USGS)

PROPER HYDRATION OF CLAYS FOR ROCK PROPERTY DETERMINATIONS,
Core Lab., Inc., Dallas, Tex.
D. C. Bush, and R. E. Jenkins.
Journal of Petroleum Technology, Vol 22, No 7, p 800-804, July, 1970. 4 fig, 1 tab, 15 ref.

Descriptors: *Sandstones, *Porosity, *Permeability, *Porous media, *Clays, Sand aquifers, Cores, Adsorption, Bound water, Expansive clays, Montmorillonite, Laboratory tests, Humidity.
Identifiers: *Core analysis procedures.

Most sand formations have some clay minerals associated with the sand particles. In the use of core analysis data for the calibration of down-hole logging tools whose responses are interpreted in terms of rock properties, pore water should be distinguished from the adsorbed (nonliquid) water associated with clays. Porosity and permeability measurements are affected also by adsorbed water. A survey of the literature on adsorption of water by clays indicates that one to two molecular layers of adsorbed water is the proper amount to consider as part of the rock volume. The porosity equivalent represented by the last two layers of adsorbed water is about 0.33 percent porosity for one percent montmorillonite in the sample. The recommended procedure for clayey samples is to dry the specimen in a controlled 40 percent relative humidity at a temperature of 140 to 145F to constant weight. Tests were made on sandstone cores to show the effect of further drying at 175 to 180F. In general, the permeability (to air) of the dry samples showed an increasing error with decreasing permeability. Similarly, there was an increasing error in dry porosity values with decreasing porosity values. At a value of 20 percent porosity (partially humidified condition) the error in a completely dried sample containing about 10 percent swelling clay was about 25 percent of the value, or 5 porosity percent. Error was only 4 percent in a relatively clay-free sandstone. (Gray-NWWA)

SEISMIC-REFRACTION AND EARTH-RESISTIVITY INVESTIGATION OF HYDROGEOLOGIC PROBLEMS IN THE HUMBOLDT RIVER BASIN, NEVADA,
Nevada Univ., Reno. Desert Research Inst.
W. W. Dudley, Jr., and L. D. McGinnis.
Technical Report No 1, April 1, 1962. 29 p, 10 fig, 19 ref.

Descriptors: *Groundwater, Geophysics, *Seismic studies, *Resistivity, Electrical studies, Subsurface investigations, *Nevada.
Identifiers: *Humboldt River Basin (Nev), *Test-well drilling, Basalt, Consolidated sediments, Alluvial sediments, Flood plain deposits, Valley fill.

Experiments with seismic refraction and electrical resistivity instruments were conducted in the vicinity of Winnemucca, Nevada, an area in which the detailed geology is well-known, to determine the value of the geophysical methods in ground water studies. It was concluded that the seismic refraction method can be used to predict depth to bedrock and thickness of valley fill with considerable accuracy. Determination of the lithology and hydrologic characteristics of earth materials is less certain. The earth resistivity method is not as useful as seismic refraction but it may aid in interpreting lithology if used with sufficient control. Conjunctive use of the two methods does not produce as much useable information as test-well drilling but can result in material reduction of the number and depth of test wells necessary for acquiring needed information. Reconnaissance geophysics early in an investigation aids greatly in defining areas where test drilling is most needed. (Hunt-NWWA)

PLANNING AND ANALYSIS OF PULSE-TESTS,
Continental Oil Co., Ponca City, Okla.
W. E. Brigham.
Journal of Petroleum Technology, Vol 22, No 5, p 618-624, May, 1970. 6 fig, 2 tab, 4 ref.

Descriptors: *Transmissivity, *Storage coefficient, *Aquifer characteristics, Porous media, Porosity, Permeability, Flow, Testing, *Testing procedures.
Identifiers: *Pulse test, Well pair, Buildup, Interference.

Approximate equations are developed for the analysis of pulse-test data. Graphs illustrate the pulse-test pressure response and the effect of pulse time. The over-all range of pulse time is only about ten-fold. The pulse-test should be designed so that pulse times fall about in the middle of the effective range. An example problem shows how to predetermine pulse time. Inhomogeneities, geometry and boundaries are recognized as factors that affect the magnitude and timing of the response but they are not included in the simplified treatment given. If the pulse-test is planned so that production times and shut-in times are equal, the response can be determined by the equations given. The calculations can be made rapidly. Transmissibility and storage include the properties of compressibility, viscosity, porosity, permeability and reservoir thickness. Because specific values for only two of these properties can be determined by pulse-testing, the other three must be determined by other means. The time required to make a pulse-test is about the same as for a conventional interference test. (Gray-NWWA)

THE MEASUREMENT OF THE HEAT OF REACTION BETWEEN PROTEINS AND CLAY MINERALS BY MICROCALORIMETRY,
New Hampshire Univ., Durham. Inst. of Natural and Environmental Resources.
B. M. Kilcullen.
Available from the National Technical Information Service as PB-226 416 $5.75 in paper copy, $1.45 in microfiche. M Sc Thesis, May 1973. 65 p, 11 fig, 15 tab, 33 ref, 3 append. OWRR A-020-NH (2).

Descriptors: *Thermal properties, *Clay minerals, *Proteins, *Heat, Measurement, Analytical techniques, Equipment, Data collections, Correlation analysis.
Identifiers: Microcalorimetry.

The heat of reaction during the adsorption of proteins by clay minerals was investigated. All measurements were obtained with a Calvet Microcalorimeter. The sensitivity of this microcalorimeter (plus or minus 0.001 C) required careful evaluation of all experimental procedures used. The colloidal character of the protein (Lysozyme, M.W. 14, 400; Isoelectric Point 11-11.2) and the clay mineral (sodium-smectite) used required adequate mixing in the calorimeter cell to allow complete reaction. The net heat of reaction between Lysozyme (40 mg/ml; 60 mg/ml; 100 mg/ml) and a sodium-smectite was determined. The corresponding heats of dilution of the protein also were measured. (Woodard-USGS)

PRESSURE BOMB MEASUREMENTS INDICATE WATER AVAILABILITY IN A SOUTHWESTERN RIPARIAN COMMUNITY,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
C. J. Campbell.
USDA Forest Service Research Note RM-246, August 1973. 4 p, 1 tab, 5 ref.

Descriptors: *Soil moisture, *Riparian plants, Plant physiology, *Moisture stress, *Microclimatology, Microenvironment, *Water loss, Evapotranspiration, Measurement, *Pressure measuring instruments, *Arizona, Deciduous trees, Shrubs, Cacti, Vegetation.
Identifiers: Pressure bomb.

The microclimate of a riparian community was studied in 1970 and 1971 on a one-acre plot at Sycamore Creek near Sunflower, Arizona, occupied by a mixed stand of several deciduous trees, shrubs, and cactus. In spring and summer, soil moisture availability is the most important environmental variable affecting plant moisture stress. The Scholander pressure-bomb technique was used to detect differences in plant moisture stress between and among species, thereby delineating areas of high or low potential evapotranspiration within a riparian zone. EFFECT OF DRYING ON WATER RETENTION OF A PUDDLED SOIL,
Agricultural Research Service, Auburn, Ala. Soil and Water Conservation Research Div.
H. M. Taylor.
Soil Sci Soc Am Proc, Vol 36, No 6, p 972-973, 1972.
Identifiers: *Drying, *Puddled soils, Soils, *Water retention.

Water retention of a silty clay loam soil was increased by puddling. If the puddled samples were dried at 110C prior to testing, water retention at all potentials between -1/5 and -15 bars was similar to nonpuddled soil. If samples were predried to any water potential below the test value, then rewet, their water retention reverted toward that of samples in the non-puddled state.--Copyright 1973, Biological Abstracts, Inc.

SURFACE CIRCULATION OF LAKES AND NEARLY LAND-LOCKED SEAS,
Woods Hole Oceanographic Institution, Mass.
K. O. Emery, and G. T. Csanady.
Proceedings of the National Academy of Sciences, Vol 70, No 1, p 93-97, January 1973. 3 fig, 48 ref.

Descriptors: *Water circulation, *Lakes, *Estuaries, *Winds, *Upwelling, *Temperature.
Identifiers: Northern Hemisphere, Surface circulation, Counterclockwise circulation.

The pattern of surface circulation has been mapped for more than 40 lakes, marginal seas, estuaries, and lagoons. All are within the northern hemisphere, and all except one are known to have a counterclockwise pattern. This consistent pattern is attributed to the drag of wind blowing across the bodies of water. Warmer surface water is displaced to the right-hand shore zone (facing downwind), where it produces greater surface turbulence and, thus, greater wind drag. This effect leads to counterclockwise water circulation regardless of the direction and, within limits, the duration of the wind. (Sinha - OEIS)

TRACE METALS IN A TUNDRA POND: VARIATIONS IN CONCENTRATION AND THEIR EFFECT ON PHYTOPLANKTON POPULATIONS,
Alaska Univ., College. Inst. of Marine Science.
R. J. Barsdate.
In: Pathways of Trace Elements in Arctic Lake Ecosystems: Progress Report 8 to Atomic Energy Commission, p 3-19, 1972. 4 fig, 4 tab, 9 ref.

Descriptors: *Water analysis, *Trace elements, *Phytoplankton, *Ponds, *Alaska, Arctic, Tundra, Correlation analysis, Chemical analysis, Heavy metals, Analytical techniques, Data collections, Evaluation, Chemical reactions, Ecosystems.
Identifiers: *Barrow (Alaska).

During an investigation of trace metal complexation in arctic waters, high concentrations of copper and lead were found in a small tundra pond occupying a low-centered polygon near Barrow, Alaska. These metal levels appeared anomolous when compared with trace metal data previously compiled for high latitude lakes and ponds. Investigations of the phytoplankton sensitivity to trace metal additions in the pond suggested that the trace metal concentrations observed might affect the pond's phytoplankton population. Trace metal results are presented along with primary productivity, algal biomass, and species composition data. Analytical techniques are described. (See also W74-01401) (Woodard-USGS)
W74-02726

THE INFLUENCE OF DISSOLVED HUMIC SUBSTANCES ON TRACE METAL PHOTOTOXICITY,
Alaska Univ. College. Inst. of Marine Science.
R. J. Barsdate.
In: Pathways of Trace Elements in Arctic Lake Ecosystems: Progress Report to Atomic Energy Commission, p 20-36, 1972. 1 fig, 4 tab, 13 ref.

Descriptors: *Water analysis, *Trace elements, *Organic compounds, *Lakes, *Alaska, Dissolved solids, Correlation analysis, Chemical analysis, Heavy metals, Sampling, Data collections, Evaluation, Arctic, Tundra, Phytoplankton, Chemical reactions, Ecosystems.

Work on the interrelationships between trace metals and biota in high latitude aquatic systems has provided information on rates of metal assimilation, possible changes in metal speciation resulting from biochemical interactions, and the effects of metals on primary producers. Dissolved organic compounds (humic materials) which can complex metals have been found in abundance in some Alaskan lakes, and it is likely that in these lakes the effects of trace metals on plankton algae may be altered substantially by complexation. Water samples were taken from three Alaskan lakes, for which general limnology, trace metal concentration, and organic complexation data previously had been obtained. In lakes with high natural concentrations of humic complexing agents the suppression of phytoplankton production by the addition of trace metals was more pronounced than in a lake with a very low dissolved organic content. The experimental additions of a metal-free humic preparation to lake water naturally low in organics also resulted in an increased sensitivity to metals. These observations suggest that metals complexed by dissolved humic substances are available physiologically to the phytoplankton. (See also W74-01401) (Woodard-USGS)
W74-02727

LAGOON CONTRIBUTIONS TO SEDIMENTS AND WATER OF THE BERING SEA,
Alaska Univ. College. Inst. of Marine Science.
R. J. Barsdate, M. Nebert, and C. P. McRoy.
In: Pathways of Trace Elements in Arctic Lake Ecosystems: Progress Report to Atomic Energy Commission, p 38-71, 1972. 6 fig, 4 tab, 31 ref. AEC Contract AT (45-1)-2229 No 2.

Descriptors: *Water analysis, *Heavy metals, *Lagoons, *Arctic, Sedimentology, Chemical analysis, Sampling, Pondweeds, Correlation analysis, Inflow, Discharge (Water), Oceans, Organic compounds, Sediments, Data collections, Ecosystems, Hydrobiology, Alaska, Tundra, Chemical reactions, Trace elements.
Identifiers: *Bering Sea, Eelgrass.

Izembek Lagoon is an embayment of the Bering Sea at the tip of the Alaska Peninsula and has been the principal site for sea grass community studies in the eastern Bering Sea since 1963. This study of the lagoon suggests that through biogenic modifications the water flowing from the lagoon is as different in many important geochemical parameters as is river water entering the sea from terrestrial sources. The vast eelgrass meadows of the lagoon annually produce 166,000 metric tons of particulate carbon, 7,400 metric tons of nitrogen, 1,660 metric tons of phosphorus, 3.45 metric tons of copper, and 386 metric tons of silica. Only a small fraction of the total production is recycled within the lagoon. In addition to elements incorporated in detached floating eelgrass, the lagoon exports substantial quantities of dissolved carbon, nitrogen, and phosphorus. Dissolved copper and silica, on the other hand, are lost to the lagoon from the Bering Sea at rates which may exceed 200 metric tons of copper per year and 600 metric tons of silica per year. Lead also is removed from the Bering Sea but in somewhat smaller quanitities. The fixed carbon and other elements from sea grasses which eventually are incorporated in the detrital organics of Bering Sea sediments may form an important component of Bering Sea food webs. (See also W74-01401) (Woodard-USGS)
W74-02728

ELECTROCHEMICAL MEASUREMENT OF ZINC IN ORGANIC-RICH WATER,
Alaska Univ. College. Inst. of Marine Science.
R. J. Barsdate.
In: Pathways of Trace Elements in Arctic Lake Ecosystems: Progress Report to Atomic Energy Commission, p 72-85, 1972. 4 fig, 3 tab, 4 ref. AEC Contract AT (45-1)-2229 No 2.

Descriptors: *Water analysis, *Zinc, *Organic compounds, *Lakes, *Arctic, Chemical analysis, Analytical techniques, Electrochemistry, Sampling, Data collections, Chemical reactions, Ecosystems, Alaska, Tundra, Trace elements.

In the organic-rich lakes investigated in the Alaska Arctic region, it appears that a large fraction of the total zinc present is in the form of dissolved complexes or perhaps colloidal complexes, which are not retained on a 0.45 micrometer membrane filter, and that in many cases a smaller fraction is present in simple inorganic forms. Additional small quantities of zinc added as the chloride are distributed between complexed and free zinc without changing the relative abundance of the distribution of zinc-65 between lake water and organic-free solutions separated by dialysis membranes (Barsdate, 1970). Results of electrochemical determinations of zinc in these waters appear to confirm these conclusions, as additions of zinc chloride produce smaller increases in analytically detectable zinc than do similar additions to organic-free media, and the increase in detectable zinc varies linearly with added zinc. (See also W74-01401) (Woodard-USGS)
W74-02729

A MORPHOMETRIC DESCRIPTION OF LAKE ISSYK-KUL' (MORFORMETRICHESKAYA KHARAKTERISTIKA OZERA ISSYK-KUL'),
G. V. Kodyayev.
Vsesoyuznoye Geograficheskoye Obshchestvo Izvestiya, Vol 105, No 4, p 362-365, July-August 1973. 1 fig, 2 tab.

Descriptors: *Lakes, *Lake morphometry, *Dimensions, *Measurement, Lake shores, Lake basins, Slopes, Curves.
Identifiers: *USSR, *Lake Issyk-Kul', Planimetry, Isobaths.

The length of Lake Issyk-Kul' in northeast Kirgizia (Soviet Central Asia) is 178.0 km. The maximum width of the lake is 60.1 km, and the mean width is 35.0 km. Maximum depth of the lake is 668 m, and mean depth is 278.4 m. The surface area of the lake, determined by planimetry, is 6,236.0 plus or minus 5.6 sq km. The lake volume is 1,738 cu km, and the shoreline length is 688 km. The lake basin is described as a frustum of a cone with an almost flat lower base. Minimum bottom slopes occur on the east and west. The distance from the shore to a depth of 600 m in these regions is 50-60 km, and the bottom slope is about 0 deg 04 min. Maximum slopes occur near the southern shore where they reach 7 deg 30 min. The maximum bottom slope (10 deg 11 min) was measured at the southern shore west of Tamga near Tossor village. The mean water level of the lake in 1968 was 1,607.6 m above sea level. (Josefson-USGS)
W74-02755

ON THE MEAN DRIFT IN LARGE LAKES,
Massachusetts Inst. of Tech., Cambridge.
C. Wunsch.
Limnology and Oceanography, Vol 18, No 5, p 793-795, September 1973. 1 fig, 5 ref. ONR N00014-67-A-0204-0048.

Descriptors: *Lakes, *Water circulation, Limnology, Internal waves, Currents (Water), Winds, Thermal stratification.
Identifiers: *Kelvin waves, *Lake circulation.

Large northern hemisphere lakes show an apparent mean surface drift in the counterclockwise direction. The effect can be explained by the Lagrange dirft induced at second order by internal Kelvin waves. Reversals of the mean drift with depth are predicted. (Knapp-USGS)

A MICROBENTHOS STUDY OF ROTATORIA,
Lund Univ. (Sweden). Limnological Inst.
BrunoBerzins.
Hydrobiologia. 40 (3): 447-452. Illus. 1972. (English summary).
Identifiers: *Benthos, Lakes, Micro-benthos, *Rotatoria, *Sweden (Lake Straken).

In Lake Straken, in southern Sweden, an investigation was carried out on bare sand bottoms, sand bottoms covered with very short Juncus and stone surfaces. All unfixed organisms were sucked up into a sample bottle through a funnel. Only Rotifera were examined quantitatively. The investigation showed that a funnel with a diameter of 3 cm gave quantitatively acceptable results, but when using one with a diameter of 5 cm the central part of the sample area was not completely depleted of organisms. The total number of species was 20:15, and the number of individuals 37:23. The bottom was investigated to a depth of 50 cm. During the whole investigation the weather was completely calm. The numbers from the different depths on bare sand bottoms from sandy bottoms covered with Juncus and from the stone surfaces are presented. The bare sand bottoms were the poorest, probably because the Rotifera there have to migrate long distances horizontally when the water level fluctuates. On stone surfaces the Rotifera fauna was more abundant, probably because when the water level fluctuates the fauna has to migrate only a short distance to find protection. The sample area of 10 x 7 cm from each biotope is sufficient to get an adequate picture of the distribution of Rofifera in a lake. To be able to compare different lakes, however, an enlargement of the sample area would be necessary.--Copyright 1973, Biological Abstracts, Inc.

DETERMINATION OF THE HEAT CAPACITY OF LAKE KARIBA,
Rhodes Univ., Grahamstown (South Africa). Dept. of Zoology and Entomology.
K. A. J. King.
South African Journal of Science, Vol 69, No 4, p 119-120, April 1973. 2 fig, 1 tab, 3 ref.

Descriptors: *Heat budget, *Energy budget, *Thermal capacity, *Reservoirs, *Water temperature, Heat balance, Thermocline, Epilimnion, Radiation, Thermal stratification, Lakes.
Identifiers: *Lake Kariba.

The total heat income integrated over the total depth of Lake Kariba was derived graphically from the maximum summer and minimum winter temperatures at various depths and the corresponding area of water at those depths. Compared with lakes elsewhere in the world Lake Kariba has a relatively low heat budget. This is due in part to its comparative shallowness, its depth averaging only 30 m. The thermocline is situated at 20 m for most of the year, the overlying epilimnion storing most of the heat supplied to the lake in summer. The relatively high mean annual temperature of Lake Kariba implies that heat losses from radiation will be correspondingly high. The annual heat income for Basin 5, the portion of the lake with the most reliable hydrological records, was calculated to be 13,100 cal sq cm, equivalent to a retention of only 6.5% of the total heat available. (DWA)

PRELIMINARY REPORT ON SMALL FISHES FROM THE HENDRIK VERWOED DAM, ORANGE RIVER,
J. L. B. Smith Inst. of Ichthyology, Grahamstown (South Africa).
P. B. N. Jackson.
South African Journal of Science, Vol 69, No 3, p 85-87, March 1973. 3 fig, 9 ref.

Descriptors: Aquatic life, Freshwater fish, Fish populations, *Fish reproduction, Spawning.
Identifiers: Hendrik Verwoerd Dam, *Orange River (South Africa).

The first sample of juvenile fish from the Hendrik Verwoerd Dam since its closure was collected on October 4, 1972 using a small seine net. The fish were obtained by only two hauls, one partly ineffective, in about 60 cm of water and comprised 22 Labeo capensis, 86 Labeo umbratus, 1 Cyprinus carpio and 145 Barbus anoplus, the first three being young of large species of commercial importance. The preliminary data support earlier findings on the high reproduction rates and a high survival rate of juveniles of the species studied in a newly impounded lake. (DWA)

ON ENVIRONMENTAL FACTORS OF EEL PONDS: CHEMISTRY OF WATER AND SOIL AND PLANKTON IN MARCH AND JUNE 1967, (IN JAPANESE),
Freshwater Fisheries Research Lab., Tokyo (Japan).
T. Ito, J. Toi, and Y. Satomi.
Bull Freshwater Fish Res Lab Tokyo. Vol 21, No 1, p 15-19. 1971. Illus.
Identifiers: Chemistry, *Eel ponds, *Environmental factors, Plankton, Ponds, Soils, *Zooplankton.

Ecological conditions in an eel pond during the overwintering period (March) and in the feeding period (June) are compared. In March the water pH is most often above 9 and sometimes above 10. Severe burns of the gills and unraveling of the fins which is predominant in March is due to the high pH. Alkalinity and NH4-H content of the water are lower in March than in June. Number of species and individuals of zooplankton is lower in March than in June although the difference is not large.--Copyright 1973, Biological Abstracts, Inc.

HENNEGUYA SP. (SPOROZOA:MYXOSPORIDA) AS A PROBABLE CAUSE OF DEATH OF ESOX NIGER IN BROME LAKE, QUEBEC,
Noranda Research Centre, Pointe Claire (Quebec).
C. E. Delisle.
Can J Zool. Vol 50, No 11, p 1499-1500. 1972. Illus.
Identifiers: *Canada (Brome Lake-Que.), *Esox-Niger, Gill filament, *Henneguya-Sp, Infection, Lakes, Myxosporida, Sporozoa, Parasites.

Fantham et al. had studied and proposed H. esocis in 1939. Since that time, no other study was carriedout on this subject. The parasite described was also found in Brome Lake (Canada) chain pickerel and caused a gill filament infection as described by Fantham et al. However, the morphology of the parasite is somewhat different than H. esocis and moreover, the infection is serious enough to be the probable cause of death of the hosts. All specimens autopsied were found heavily infected by Henneguya sp.--Copyright 1973, Biological Abstracts, Inc.

ACTON LAKE: BIOLOGY OF ITS BENTHOS AND NOTES ON ITS PHYSICAL LIMNOLOGY 1959-1970,
Miami Univ., Oxford, Ohio. Dept. of Zoology.
P. M. Daniel.
Ohio J Sci, Vol 72, No 5, p 241-253, 1972, Illus.
Identifiers: *Benthos, Biology, Biomass, Chemical studies, Lakes, *Limnology, *Ohio (Acton Lake), Stratification, Thermal, Benthic fauna.

Acton Lake is a 253-ha impoundment located in a heavily used state park in south-western Ohio. The length from inflow stream to spillway is 4.3 km, the total shoreline length if 13.9 km, the mean depth is 4.3 m and the maximum depth is 10.4 m. Sediment accumulation averaging 0.023 m annually provides a possible useful life of the lake for recreation of about 140 yr. The lake stratifies chemically and thermally in the summer. Oxygen depletion occurs at the lower depths in the summer. Chironomids are the most numerous component of the macrobenthic fauna of the whole lake and chaoborids are quite abundant in deeper waters. The wet-weight benthic biomass is greatest in late winter before spring emergence. Funnel trapping has yielded a total of 1400 organisms/m for the emergence season from early spring to late fall. Annelids and pelecypods appear to have been increasing in numbers in recent years.--Copyright 1973, Biological Abstracts, Inc.

RESPIRATION AND THERMAL TOLERANCE OF PHYLLOPOD CRUSTACEA TRIOPS LONGICAUDATUS AND THAMNOCEPHALUS PLATYURUS INHABITING DESERT EPHERMERAL PONDS,
California Univ., Riverside. Dept. of Biology.
S. D. Hillyard, and A. Vinegar.
Physiol Zool. Vol 45, No 3, p 189-195. 1972. Illus.
Identifiers: *Crustacea (Phyllopod), Desert, Ephemeral ponds, Larva, *Ponds, *Respiration, Thamnocephalus-Platyurus, *Thermal tolerance, Triops-Longicaudatus.

Oxygen consumption and thermal tolerances ere measured in the phyllopod crustacea T. longicaudatus and T. platyurus inhabiting desert ephemeral ponds in southeastern Arizona and southwestern New Mexico. Measurements were made during consecutive 1-hr exposures to 26, 30, 34, 38, 40, 42 and 44C in order to approximate the continual rise in temperature that occurred in the ponds during the day. Both larvae and adults were used. The mean oxygen consumption of the larvae increased markedly between 26 and 30C, with Q10 values of 4.12 for Triops and 11.81 for Thamnocephalus. Oxygen consumption of the adults increased very little over the temperature span of the experiment. Larvae and adults of each species showed similar thermal tolerances to 1-hr exposures to the experimental temperatures. All of the Triops had died after 1-hr exposure to 42C, while some of the Thamnocephalus survived until 20 min of exposure at 44C. The animals were observed to come to the surface regularly, with their respiratory appendages stirring the top layer of the ponds. For this reason, oxygen levels are probably seldom a limiting factor. The water temperature was never as high as the thermal maxima determined experimentally. Horne (1971), however, recorded a water temperature of 43C in a shallow pond, indicating that lethal temperatures can exist in nature. The near maximal levels of respiration observed in the adults over the range of experimental temperatures and the high Q10 values for oxygen consumption of the inmatures between 26 and 30C are probably related to the rapid growth rate that these animals must sustain in order to become sexually mature and reproduce in the transient ephemeral pond habitat.--Copyright 1973, Biological Abstracts, Inc.

HORIZONTAL PARTICLE VELOCITY PROFILES BENEATH THE CRESTS OF WAVES BREAKING ON A SUBMARINE BAR,
Michigan State Univ., East Lansing. Dept. of Natural Science.
W. L. Wood, Jr.
Available from NTIS as AD-717 365, $3.00 paper copy, $1.45 microfiche. Technical Report No. 3, December 1970. 68 p, 22 fig, 43 ref. Contract ONR N00014-68-A-0109-0002.

Descriptors: *Waves (Water), *Hydrodynamics, Michigan, Coasts, Lakes, *Shallow water, Deformation, *Profiles, Energy, *Lake Michigan.
Identifiers: *Breakers, *Particle velocity, Submarine bars, Near shore, Wave transformation.

The horizontal particle velocity profiles beneath the crests of breaking waves have been measured and evaluated for waves breaking on a submarine bar. A breaking wave classification system based upon the cross-sectional symmetry of the wave was used to isolate three distinct breaker groups. 'Characteristic' wave and horizontal particle velocity profiles were obtained by averaging the wave and velocity profiles from individual waves within each symmetry group. These wave and horizontal particle velocity profiles of the symmetry groups define hydrodynamic conditions for the physical characteristics of the breaking wave. The contrast between the gently spilling symmetric breaker of this study and the plunging symmetric breaker of other investigations may suggest that symmetric waves occur as both high and low energy conditions of a transforming train of irregular waves. WAVE RUNUP, MONO LAKE TESTS, 1965: A SUMMARY OF THEORETICAL PREDICTION METHODS AND SOME COMPARISONS WITH EXPERIMENTAL DATA,
URS Corp., Burlingame, Calif.
J. R. Bertram, and A. R. Kriebel.
Available from NTIS as AD-674 858, $6.00 paper copy, $1.45 microfiche. Reports No. URS-654-5, June 1968. 22 p, 4 fig, 2 tab, 25 ref, append. Nonr-4959 (00).

Descriptors: Coasts, *Beaches, *Waves (Water), *Shallow water, Prediction, Explosions, Hydrodynamics, Lakes, *California.
Identifiers: Mono Lake (Calif), *Wave runup, Shoaling, Underwater explosions.

A literature survey on water-wave runup on sloping beaches is presented along with a comparison of theory and measurements form the 1965 Mono Lake test series. These measurements of runup were about twice as large as predicted because the incident wave height was also about twice as large as predicted. A simplified calculative technique is presented which predicts the measured runup within 10 percent from the wave data measured in deep water. (Sinha - OEIS)

SIMULATION MODEL FOR EVALUATION OF INTERCEPTION LOSS FROM FOREST TREES, PART I. MODELING SNOW INTERCEPTION ON CONIFERS AND PART II. LABORATORY MODELING OF SNOW INTERCEPTION ON TREES,
Idaho Univ., Moscow. Coll. of Forestry.
G. H. Belt, and M. Molnau.
Available from the National Technical Information Service as PB-226 305 $4.25 in paper copy, $1.45 in microfiche. University of Idaho Water Resources Research Institute Research Technical Completion Report, September 1973. 91 p, 8 fig, 13 tab, 15 ref. OWRR B-009-IDA (1). 14-01-001-1895.

Descriptors: *Interception, *Snow, *Simulation analysis, *Idaho, Model studies, *Coniferous trees.
Identifiers: Sigmoid growth curve.

One portion of the study was conducted to develop models or methods of defining interception storage of snow on conifer trees. Field data obtained in physical modeling of individual trees and data taken from the literature were used to define mathematical relationships and were subsequently incorporated in a computer simulation model for prediction of interception storage by a stand of trees. Comparison of interception storage derived from the stand model with measurements on the model trees indicates reasonable predictive capacity for both individual tree and stand models. Several forms of the sigmoid curve were useful in defining relationships between precipitation, interception storage and the end of storms and vegetational parameters. Surface ratio, related to crown projection area, was a suitable parameter in defining differences in the format of the sigmoid curves. Second portion of the study was conducted to determine the interception characteristics of both artificial and real trees using artificial snow. A drum apparatus was constructed to allow artificial snow to be dropped over the trees. For 3 ft. high artificial troes, the smaller branch angles intercept more snow than larger branch angles in terms of interception over projected areas of the tree. The shape of the interception vs precipitation curve is the same for both real and artificial trees except that the amounts are considerably less for real trees.

VEGETATION OF THE MISSOURI RIVER FLOODPLAIN IN NORTH DAKOTA,
North Dakota State Univ., Fargo. Dept. of Botany.
R. L. Burgess, W. C. Johnson, and W. R. Keammerer.
Available from the National Technical Information Service as PB-226 366 $4.75 in paper copy, $1.45 in microfiche. North Dakota Water Resources Research Institute Report WI-221-018-73, June 1973. 162 p, 61 fig, 12 tab, 179 ref, 2 append. OWRR A-022-N DAK (2).

Descriptors: *Vegetation, *Flood plains, *Missouri River, *North Dakota, *Baseline studies, Environmental effects, Forestry, Engineering structures, Dams, Trees, Growth rates, Reproduction, Plant physiology, Data collections, Soil types, Geology, Climatic data.

An 80-mile-long study area, bordered by Garrison Dam and Oahe Reservoir, includes the only extensive, remaining floodplain forest vegetation in the Missouri Valley in the Dakotas. Data were collected to assess the water relations and nutrient status of each stand, to determine the abundance of plant species, and to examine the behavior of species along environmental gradients. Attainment of the study objectives filled a gap in the knowledge of the forest vegetation of North Dakota. It is now known, in detail, what plant species comprise the forests of the Missouri Valley, how they are arranged into plant communities, the environmental conditions found within each community, and how the meandering nature of the river influences community dynamics and development. This work has provided information regarding the forest habitat used by agricultural Indian tribes less than a century ago. Many of the remaining forests are currently being cleared, selectively cut, and grazed, and it was necessary to collect data from these forests before they, too, disappeared. The construction of dams has eliminated periodic flooding throughout the study area. Data collected during the course of this study indicate that flood protection has led to decreased tree growth and a decline in tree reproduction. (Woodard-USGS)

FOG DRIP FROM ARTIFICIAL LEAVES IN A FOG WIND TUNNEL,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
R. A. Merriam.
Water Resources Research, Vol 9, No 6, p 1591-1598, December 1973. 7 fig, 3 tab, 15 ref.

Descriptors: *Interception, *Water storage, *Fog, *Forests, *Leaves, Water balance, Precipitation (Atmospheric).
Identifiers: Wind tunnels, Fog drip.

The effect of fog intensity and leaf shape on water storage on leaves was studied by using a simple fog wind tunnel and leaves of aluminum and plastic. Test equipment was designed to allow quantification of the chosen variables rather than to duplicate natural conditions. Two intensities of fog were produced, and drip was measured from leaves of five different shapes. Fog intensity effects tended to obscure weaker leaf shape effects in the tests. Drip measurements were reasonably close to values predicted by calculation using an exponential equation based on fog flow and leaf storage capacity. This method of estimating fog drip could be useful when appropriate climatic and vegetative characteristics are known. (Knapp-USGS)

ODONATA OF SUGADAIRA AND VICINITY,
Tokyo Univ. of Education (Japan).
K. Miyakawa, K. Narumi, A. Shimizu, and H. Ando.
Bull Sugadaira Biol Lab. 5 p 1-18. 1972. Illus. English summary.
Identifiers: Agrio-Lanceolatum, *Japan, Lestes-Sponsa, Leucorrhinia-Dubia-Orientalis, Libellula-Quadrimaculata, *Odonata, Somatochlora-Viridianenea, Sympetrum-Frequense, Sympetrum-Infuscatum, Tanypteryx-Pryeri.

This study presents a faunistic record and some ecological nots on Odonata occurring in Sugadaira heights (ca. 1300 m a.s.l. (above sea level)), Nagano Prefecture (Japan) and its surrounding lowland areas, viz, Ueda City, Suzaka City, inclusive of the neighboring highlands, Sampogamine swamp (1860 m a.s.l.). The Odonata of this district are composed of 58 spp., of which 33 are northern or alpine species while 24 are southern or cosmopolitan. The distributionally restricted species may be Somatochlora viridiaenea viridianenea and Agrion lanceolatum of Sugadaira heights, Leucorrhinia dubia orientalis of Sampogamine swamp, Tanypteryx pryeri of Seni at the foot of Sugadaira heights and Aeschna juncea of both Sugadaira and Sampogamine. The larval habitats of the above Odonata species are described briefly. A study on the reproductive behavior of Somatochlora viridiaenea viridianenea in dry places, 3 km apart from the oviposition sites, is discussed. The habitat selection of Sympetrum frequense is discussed. S. infuscatum in highland water areas is recorded. This species is not such a strong migrator as the former. Eggs of Lestes sponsa (25%) collected from Sampogamine Swamp were found to be damaged by a parasitic Hymenoptera. The reproductive behavior of Libellula quadrimaculata asahinai is briefly recorded.--Copyright 1973, Biological Abstracts, Inc.

GEOBOTANICAL PROCESSES IN THE SASKATCHEWAN RIVER DELTA,
Department of Indian Affairs and Northern Development, Ottawa (Ontario). Environmental-Society Program.
H. J. Dirschl.
Can J Earth Sci. Vol 9, No 11, p 1529-1549, 1972. Illus.
Identifiers: *Canada (Saskatchewan River), Deltas, *Geobotanical processes, Gradients, Mats, Moisture, Peat, Rivers, Seasonal, Sedge, Soils, Sphagnum, Spruce, Temperatures, *Vegetation, Water table.

The interactions of substrate, soil frost, groundwater levels, vegetation and ongoing landscape-forming processes were studied in a portion of the Saskatchewan River Delta, Canada. Representative field transects were used to relate vegetation types to differences in relief and seasonal water table elevation. Seasonal soil temperatures were recorded and peat stratigraphy was determined. Vegetation zonations, extending from mixed forest on river levees to open lake water obviously reflect moisture gradients. However, increasing moisture availability is paralled by declining nutrient availability, away from the levees, as peat accumulation prevents rooting in the mineral soil. Nutrient status and type and degree of peat accumulation are thus dependent on landform and water circulation. Three main physiographic divisions were recognized; alluvial levees, open drainage basins, and closed drainage basins. Alluvial levees, paralleling stream channels, are generally well drained, nutrient-rich, and covered by mixed forest and tall shrub communities. Open drainage basins are characterized by slow circulation of mineral waters, favoring growth of minerotrophic fens and floating sedge mats. Closed drainage basins are more or less completely surrounded by raised levees. Their source of water is limited runoff from the encircling levees and precipitation falling onto the basins. Deep peat deposits are characteristic of these sites. Nutrient levels are lower than in open basins and sphagnum moss commonly occurs above the fen peat deposits. The slightly raised centers of these closed basins often support black spruce bog communities.--Copyright 1973, Biological Abstracts, Inc.

Biacetabulum hoffmani is described from Hypentelium etowanum and Moxostoma erythrurum: Isoglaridacris jonesi is from the latter host. B. hoffmani differs from the other 2 nonacetabulate species in the genus by having conspicuous bothria and a disc on the scolex, a short neck, and twice the number of testes. I. jonesi differs from others in the genus primarily by lacking postovarian vitellaria and having weakly developed loculi on the scolex. A discussion of pertinent morphological features, comparisons with related species, and note of intensity and incidence data follow each description.--Copyright 1973, Biological Abstracts, Inc.

2J. Erosion and Sedimentation

A FUNCTION FOR SAND MOVEMENT BY WIND,
California Univ. Berkeley. Hydraulic Engineering Lab.
A. A. Kadib.
Available from NTIS as AD-633 841, $6.00 in paper copy. Institute of Engineering Research Technical Report No HEL-2-12, prepared for Army Coastal Engineering Research Center, January 1965. 91 p, 22 fig, 9 tab, 38 ref. DA-49-055-CIV-ENG-63-4.

Descriptors: *Sediment transport, *Wind erosion, *Beach erosion, Coasts, Saltation, Beaches.
Identifiers: Lift force.

A method for calculating the rate of transport was developed. This method was based on experience gained in the field of sediment motion in rivers and all available field and wind tunnel data on the subject. The basic forces causing the sediment motion are those of the average lift L and the fluctuating part L caused by the burbulence. Another factor contribution to the motion in the case of wind is the effect of impact, caused by the particle in saltation, in disturbing the bed surface. The effect of impact was found to be a function of the main forces causing the motion and therefore it was introduced as a correction for the mean lift force caused by the distortion of the fluid field around the bed particles. The basic principles governing the rate of sediment transport by water and air are the same. The only difference was the effect of saltation on disturbing the bed surface in the case of air. The results of this study are represented as a theoretical realtion between the flow intensity and the intensity of sediment load. The effect of particle hidding in the laminar sub-layer was combined with the impact correction to give a final wind correction which proved to be a function of the parameter describing the ratio between the submerged weight of the particle and the mean lift force. The method is applicable for calculating the rate of sand transport under a wide range of wind velocities and for sand sizes ranging from 0.145 mm to 1.00 mm. Application of the derived method for calculating sand transport by wind from natural beaches is given. (Sinha-OEIS)

OBSERVATIONS ON FLOATING BREAKWATERS FOR REFLECTION OF SHALLOW WATER WAVES (RECHERCHES SUR LES BRISE-LAMES FLOTTANTS DESTINES A REFLECHIR LA HOULE EN EAU PEU PROFONDE),
Newcastle Univ. Coll. (Australia).
A. K. Johnston.
La Houille Blanche, Vol 13, No 5, p 540-550, October 1958. 4 fig, 4 ref.

Descriptors: *Beach erosion, *Shore protection, *Breakwaters, Resonance, *Shallow water.
Identifiers: *Floating breakwaters, Wave reflection.

The present study arose from a problem of beach erosion. Since steep waves erode a beach and low camber waves build it up, the possibility of partial reflection of oncoming waves by floating barriers was considered as a means of protection. The objective was to reflect sufficient energy so that waves reaching the shore would be constructive rather than erosive. This problem has been investigated theoretically and experimentally, starting with the premise that to be effective a floating barrier should reflect approximately 50% of the energy of waves of all periods up to 10 seconds. Floating barriers cannot be rigidly restrained and their earlier use has depended simply on their inertia for reflective effect. Practical considerations of barrier size limit inertia reflection to waves of less than about 6 seconds period. To deal with the longer waves the phenomenon of resonance has been employed by making the floating barrier an opened water container of such dimensions that the enclosed water tends to reflect the longer waves by its internal resonance. Two successful designs of floating breakwaters using this combination of inertia and resonance have been developed and tested on a model scale of 1 to 120. Their performance is shown to be an advance on anything hitherto achieved and their possible wider applications for purposes besides beach protection are indicated. (Sinha-OEIS)

LONGSHORE TRANSPORT OF SAND,
Scripps Institution of Oceanography, La Jolla, Calif.
D. L. Inman, P. D. Komar, and A. J. Bowen.
In: Proceedings of the Eleventh Conference on Coastal Engineering, p 298-309, 1969. 4 fig, 13 ref. N00014-69-A-0200-6006.

Descriptors: *Sediment transport, Beaches, *Waves (Water), Suspended load, Bed load, Surf.
Identifiers: *Longshore transport.

Simultaneous field measurements of the energy flux of breaking waves and the resulting longshore transport of sand in the surf zone have been made along three beaches and for a variety of wave conditions. The measurements indicate that the longshore transport rate of sand is directly proportional to the longshore component of wave power for fully developed transport conditions; and independent of sand size within the range of about 180 to 600 microns. It is suggested that suspended load transport of sand in the surf zone is less important than bed load transport. (Sinha-OEIS)
W74-02706

A PRELIMINARY INVESTIGATION OF THE RECENT SEDIMENTS OFF THE EAST COAST OF AUSTRALIA,
New South Wales Univ., Kensington (Australia).
F. C. Loughnan, and D. C. Craig.
Australian Journal of Marine and Freshwater Research, Vol 13, No 1, p 48-56, June 1962. 3 fig, 1 tab, 13 ref.

Descriptors: *Sediment transport, *Coasts, *Bottom sediments, Clay minerals, Continental shelf, Marine geology, *Australia.
Identifiers: Differential settling.

Recent sediments from the continental shelf and inner margin of the continental slope for a section of the east Australian coast extending from Sydney to Moreton Island have been examined with respect to composition and particle size distribution. Although insufficient samples are available for conclusive evidence it would appear that there has been very little longshore movement of material and the bulk of the detritus in each sector has been derived from the immediately adjacent land areas. In the Sydney sector there is a suggested variation in clay mineral content with depth which tends to support the differential settling concept. Glauconite, in association with clay pellets, foraminiferal tests, and fine quartz, occurs in goethite and siderite cemented nodules on the continental slope off Port Macquarie and Coff's Harbour. THE EFFECTS OF WATER TABLE AND TIDE CYCLE ON SWASH-BACKWASH SEDIMENT DISTRIBUTION AND BEACH PROFILE DEVELOPMENT,
University of Southern California, Los Angeles. Dept. of Geology.
J. R. Duncan, Jr.
Marine Geology, Vol 2, No 3, p 186-197, November 1964. 7 fig, 4 ref.

Descriptors: *Sedimentation, Beaches, *Tidal effects, Profiles, *Sea level, *Water table, Erosion, Deposition, Surf, *Berms, *California.
Identifiers: Manhattan Beach (Calif), Swash, Backwash.

Fluctuations in sea level relative to beach water table level, resulting from semidiurnal tide cycles, produce appreciable effects on sediment distribution. In the swash-backwash zone, sediment distribution is dependent on the interaction of swash deposition, swash erosion, backwash deposition and backwash erosion. When the tide level is high and the beach water table is low, swash deposition and swash erosion predominate; this results in the formation of a thick sediment lens on the shoreward side of the swash-backwash zone and a scoured area on the surf side of the zone. In contrast, a relatively high water table results in maximum backwash erosion and backwash deposition; thick sediment lenses form near the surf boundary. Therefore, as sea level fluctuates above and below the general water table level with the tide, the zone of deposition correspondingly shifts within the swash-backwash zone and either increases or decreases the gradient of the beach slope. As the tide rises, sediments deposited by previous swashes are redistributed by the encroaching surf. Above the limit of surf encroachment and in the highest swash-mark area, a berm forms, which displays an onlap-offlap series of laminae; also, portions of it are cross-laminated. This berm and its internal structure are a result of sedimentation during the flood-to-ebb tide period. (Sinha - OEIS)

RESIDUAL CURRENTS IN RELATION TO SHORELINE EVOLUTION OF THE EAST ANGLIAN COAST,
Leicester Univ. (England). Dept. of Geography.
A. H. W. Robinson.
Marine Geology, Vol 4, No 1, p 57-84, February 1966. 10 fig, 16 ref.

Descriptors: *Coasts, *Shores, *Currents (Water), *Tidal streams, Erosion, *Sediment transport, Hydrography, Sedimentation.
Identifiers: East Anglian Coast, *Wave action, Residual currents, Bottom topography.

The importance of residual currents in fashioning the sea-bed configuration off the East Anglian coast can be assessed from a study of hydrographic data, including marine surveys, current observations and drogue runs. The pattern of banks and channels and the changes to which they are subject, the sediment circulation and the character of the sediments, closely reflect the residual current movements. Not only are tidal streams the most effective physiographic agents offshore but their influence also extends to the coast. Here, in combination with wave action, they can create favorable conditions for sedimentation to take place. The origin of the ness features at Winterton, Caister, Benacre and Thorpeness can be explained in these terms as well as their changing form in response to varying conditions off-shore. There is also an intimate connection between the offshore zone and coast erosion at places like Pakefield, Kessingland and Covehithe since the residual currents offshore are an important factor in determining the supply of sediment to the shoreline and hence the degree of protection afforded by the beach. GEOCHRONOLOGICAL STUDIES IN SANTA BARBARA BASIN: FE-55 AS A UNIQUE TRACER FOR PARTICULATE SETTLING,
Tata Inst. of Fundamental Research, Bombay (India).
S. Krishnaswami, D. Lal, and B. S. Amin.
Limnology and Oceanography, Vol 18, No 5, p 763-770, September 1973. 4 fig, 3 tab, 16 ref.

Descriptors: *Sedimentation rates, *Tracers, *Radioisotopes, Sedimentation, Varves, *California, Iron, Lead radioisotopes.
Identifiers: Santa Barbara Basin (Calif).

The depth distribution of several radionuclides, manmade Fe-55 and naturally occurring Pb-210, and Th isotopes in recent Santa Barbara sediment layers permit an evaluation of the geochemical behavior of Fe, Pb, and Th in coastal waters, and have established the usefulness of Fe-55 and Pb-210 for dating coastal sediments deposited during the last decade and half-century respectively. Sediments accumulate in the Santa Barbara Basin relatively rapidly, about 3-4 mm per yr based on the analysis of varves. These deposits are ideal for studying the applicability of nuclear geochronological techniques in a natural situation. (Knapp-USGS)

MINIMIZATION OF POWER EXPENDITURE IN A RIFFLE-POOL ALLUVIAL CHANNEL,
Wisconsin Univ., Milwaukee. Dept. of Geological Sciences.
D. S. Cherkauer.
Water Resources Research, Vol 9, No 6, p 1613-1628, December 1973. 9 fig, 1 tab, 14 ref.

Descriptors: *Alluvial channels, *Channel morphology, *Open channel flow, Geomorphology, Sediment Transport, Sedimentation, Channel erosion.
Identifiers: Italy.

The hypothesis that rivers adjust their flow so as to minimize total power expenditure and to minimize the sums of the variances of power and of other dependent variables was tested with empirical data and a mathematical flow model for a short reach of the Treia River in central Italy. The minimizations are tested by mathematically generating a set of flows that could occur under existing conditions and comparing the pertinent values with those of the modeled real flow. For the limited set of conditions observed (steady base flow over a stable set of riffle-pool bed forms with no movement of sediment) the stream adjusted in the postulated manner. (Knapp-USGS)

THE ROLE OF RAINFALL IMPACT IN SOIL DETACHMENT AND TRANSPORT,
Agricultural Research Service, Morris, Minn. Soil and Water Conservation Research Div.
R. A. Young, and J. L. Wiersma.
Water Resources Research, Vol 9, No 6, p 1629-1636, December 1973. 4 fig, 5 tab, 7 ref.

Descriptors: *Soil erosion, *Impact (Rainfall), *Rill erosion, Sediment transport, Soil surfaces, Hydraulic models, Model studies, Precipitation (Atmospheric), Erosion control.

The relative importance of raindrop impact and flowing water to the erosion process was determined in a laboratory study using three soils--loam, silt loam, and sandy loam--prepared with preformed rills and subjected to simulated rainfall. The source and the mode of transport were determined for all soil detached and transported from the plot under conditions of both normal rainfall energy and greatly reduced rainfall energy. Decreasing rainfall impact energy by 89% without reducing rainfall intensity decreased soil losses by 90% or more, and it was thus indicated that the impact energy of raindrops is the major force initiating soil detachment. For all three soils, 80-85% of the soil loss originating in the area between the rills was transported to a rill before leaving the plot, and it was thus indicated that the transport of detached particles from the plot was accomplished mainly by rill flow. MUD IN THE NORTH SEA,
University of East Anglia, Norwich (England). School of Environmental Sciences.
I. N. McCave.
In: North Sea Science; Proceedings of NATO North Sea Science Conference, November 15-20, 1971, Aviemore, Scotland: Massachusetts Institute of Technology, p 75-100, 1973. 3 fig, 6 tab, 65 ref.

Descriptors: *Mud, *Sediment transport, *Bottom sediments, Provenance, Path of pollutants, Oceanography, Ocean currents, Tides.
Identifiers: *North Sea.

The origin, transport, and deposition of mud in the North Sea are very poorly known. The major industrial countries of Northwestern Europe discharge high concentrations of pollutants into the North Sea via their rivers. Some of these are already mud, some are initially dissolved but subsequently become absorbed onto mud particles, and some become incorporated into planktonic material which contributes to muddy sediment. The mud deposition rate in sediment traps is about 6 thousand metric tons per sq km per yr at the present time. Areas of sandy mud should have considerably lower deposition rates, possibly of the order of 0.5 thousand tons per sq km per yr. (Knapp-USGS)

SEDIMENT TRANSPORT BY THE NORTH SEA,
National Inst. of Oceanography, Wormley (England).
A. H. Stride.
In: North Sea Science; Proceedings of NATO North Sea Science Conference, November 15-20, 1971, Aviemore, Scotland: Massachusetts Institute of Technology, p 101-130, 1973. 11 fig, 1 tab, 51 ref.

Descriptors: *Sediment transport, *Ocean currents, *Sand waves, Oceanography, Currents (Water), Tides.
Identifiers: *North Sea.

The transport of naturally occurring loose granular materials in open reaches of the North Sea is reviewed so that this information can be used as a guide to what is likely to happen to similar material introduced by man. Sand banks, sand ribbons, and sand waves are valuable bed forms whose presence indicates the importance of sand mobility, and whose shape and orientation indicate the transport direction. Sand transport directions in the sand wave zone are aligned parallel with the coasts of the North Sea. The longest single paths to be inferred are from the vicinity of the bed-load parting located at about 52 deg N as far as the German Bight. (Knapp-USGS)

ANTIDUNE AND CHUTE AND POOL STRUCTURES IN THE BASE SURGE DEPOSITS OF THE LAACHER SEE AREA, GERMANY,
Ruhr-Universitaet Bochum (West Germany). Inst. of Mineralogy.
H-U. Schmincke, R. V. Fisher, and A. C. Waters.
Sedimentology, Vol 20, No 4, p 553-574, November 1973. 16 fig, 18 ref.

Descriptors: *Sedimentary structures, *Volcanoes, Dunes, Ripple marks, Sediment transport, *Deposition (Sediments), Sedimentation.
Identifiers: *Germany (Laacher See).

Grey tuffs of late Pleistocene age form broad fans radiating from the Laacher See basin, Germany. They were derived from phreatomagmatic outbursts, and transported in turbulent pyroclastic flows, in contrast with the underlying white pumice tuffs of air fall origin. Flow origin of the grey tuffs is inferred from the well bedded plane parallel to cross bedded tephra characteristic of base surge deposits, and a variety of other sedimentary structures, as well as grain size distributions. Most of the cross bedded structures in the Laacher See deposits resemble antidunes, with steep stoss sides and very low dipping lee sides. Upcurrent migration of antidune crests is dominant close to the source, but changes to down current migration at greater distances, presumably because of decay in flow energy. The most spectacular cross bedding is somewhat similar to chute and pool structures formed under experimental conditions in alluvial flumes. These structures formed during deposition from phreatic pyroclastic flows of very high flow energy and high sediment concentration. The antidunes apparently formed at lesser flow velocity than chute and pool structures. The large wave lengths of the dune like structures, however, suggest unusually high velocities. (Knapp-USGS)

FRAGMENTATION OF GRANITIC QUARTZ IN WATER,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Soils.
A. J. Moss, P. H. Walker, and J. Hutka.
Sedimentology, Vol 20, No 4, p 489-511, November 1973. 9 fig, 1 tab, 21 ref.

Descriptors: *Quartz, *Particle size, *Alluvium, *Abrasion, Erosion, Alluvial channels, Sands, Sediment transport, Sedimentology.

Grain fragmentation was studied in a rotating drum to permit the study of all of the debris, and a fragmentation load technique was used to relate experimentally and naturally fragmented material. The investigation was focused on granitic quartz. Relatively gentle collective movement in water can cause significant fragmentation of coarse, nascent, granitic quartz grains. The debris produced by rotating in a drum a range of single sieve fractions, taken from gravel in the headwaters of a stream draining granite, had continuous size distributions down to (and probably beyond) 0.06 micrometers. Quartz was the dominant fragmentation product in all fractions down to 2 micrometers and present in finer fractions. When pebbles moved with sand in these experiments, breakage of the sand was greatly increased. The effect of attrition on granitic quartz was negligible. At least a proportion of granitic quartz grains are subject to a fatigue effect as a result of impacts in water. Granitic quartz is crisscrossed with partially healed cracks acquired before the zone of weathering is reached. The wholesale breakage that affects it, particularly in pebbly streams, is largely due to the reopening of these cracks. Progressive fragmentation of this material must eventually reach a stage wherein grains comprising single original crack-bounded volume elements are produced. Such grains, lacking significant internal weaknesses, must strongly resist further breakage. Possibly the preferential production of quartz grains just below 20 micrometers in size may represent an accumulation of these single, crack-bounded volume elements. (Knapp-USGS)

RESEARCH IN THE COASTAL AND OCEANIC ENVIRONMENT,
Delaware Univ., Newark. Coll. of Marine Studies.
W. S. Gaither, and V. Klemas.
Available from NTIS as AD-752 503, Paper copy $3.00; microfiche. Annual Status Report November 1972. 43 p, 9 fig, 12 fig. ONR Contract N00014-69-A0407.

Descriptors: Delaware, New Jersey, Maryland, Models, *Coasts, *Waves (Water), Beaches, *Sediment transport, *Shallow water, Energy, *Bays, Vegetation, *Remote sensing.
Identifiers: Wave action, *Delaware Bay.

Progress during the third year of a multi-disciplinary study of a section of the Atlantic seacoast (Delaware and adjacent areas of New Jersey and Maryland) is summarized. Models of coastal processes have been developed to aid in the analysis of coastal environments and for use in making precise short-term prediction of coastal change by means of intensive analysis of the near past historic records and sequence of geologic events. Continued theoretical investigations of wave action, model studies of sedimentary processes, and the results of additional observations of vegetative growth and of surface energy exchangees are reported. Two-dimensional optical spectral analysis of shallow water waves is discussed and other remote sensing results are summarized, with emphasis on frontal systems, suspended sediment and flow patterns in and outside Delaware Bay. THE GREAT ATLANTIC COAST TIDES OF 5-8 MARCH 1962,
Princeton Univ. N.J. Dept. of Astronomical Physics.
J. Q. Stewart.
Weatherwise, Vol 15, No 3 p 117-120, June 1962. 5 fig.

Descriptors: Delaware, *Tidal effects, *Storms, *Fetch, *Dunes, Damages, *Beach erosion, *Coastal structures, Atlantic Ocean.
Identifiers: *Breaking waves, Tidal flooding, Bethany Beach (Delaware).

The Great Atlantic Coast tides of March 5-8, 1962, were more damaging to natural coastal features and man-made structures than hurricanes. A slow moving storm having an elongated west to east axis produced a fetch, (probably in excess of 1200 miles). The flow of gales drove along waves of 40 ft or more. This vast movement of wind and water arrived on the Middle Atlantic coast at the time of maximum astronomical tides (perigee spring tides). Surface weather maps at 0700 EST, March 5,6, and 7, 1962 are included. Explanations are given on the significance of fetch, the wave train, the wave energy, and the astronomical high tide which combined to cause unprecedented damage. Air photos of the storm effects at Bethany Beach are included. (Sinha-OEIS)

LITTORAL SEDIMENTARY PROCESSES ON KAUAI, A SUBTROPICAL HIGH ISLAND,
Scripps Institution of Oceanography, La Jolla, Calif.
D. L. Inman, W. R. Gayman, and D. C. Cox.
Pacific Science, Vol 17, No 1, p 106-130, January 1963. 12 fig, 2 tab, 27 ref, append.

Descriptors: *Hawaii, Shallow water, *Beaches, *Climates, *Sediment transport, Islands, Reefs, Shells, Coral.
Identifiers: Volcanic sand, *Kauai (Hawaii).

Beach and shallow water sand samples from Kauai, Hawaiian Islands, were studied to ascertain the effects of climate on the supply of sediment, and of wave action on the dispersal and transport of sand along the shores of this circular island. The littoral sediments of the island are made up of two components; biogenous material, such as shell, coral, and foraminiferal sands, formed near the shoreline; and terrigenous material, consisting mostly of volcanic mineral and rock fragments brought to the beach by rivers. The northeast trade winds play a dominant part in the climatic and oceanographic processes affecting the island. On the windward side of Kauai, the annual rainfall ranges from 30 inches near the coast to over 460 inches at higher elevations; on the leeward side, annual rainfall is less than 20 inches. This large variation in rainfall results in a climatic range from tropic-humid to semi-arid. Rivers draining the wet, windward portion of the island carry relatively little sand, and the shoreline on this side is characterized by intermittent fringing reefs and beaches of calcareous sand. A detailed study of several reefs on the windward side of the island shows that each pair of fringing reefs, divided by a relatively deep inlet, constitute separate cells for the circulation of water and distribution of sediments. The highest concentrations of volcanic sand occur on the lee side of the island, where streams draining the semi-arid region enter the coast. The concentration of volcanic material in the beach sands decreases logarithmically with distance along the coast from the rivers. (Sinha-OEIS)

scriptors: *Bays, Equilibrium, Sediments, /aves (Water), Ocean waves, *Sediment trans-rt, Coasts, *Refraction (Water waves).
ntifiers: *Longshore drift, Shorelines.

stright sedimentary coastline containing adlands, if it suffers persistent waves from an ique direction and no replenishment is provided material removed down coast, will assume a nulate shape which becomes progressively re indented. Finally a shape is reached which is equilibrium with the waves. This occurs when incoming waves break simultaneously around periphery and there is no further longshore ft. The development of such equilibrium shaped vs was studied by means of a model in which ve direction and wave periods were the sole iables. Thus the wave height, water depth, ch height and sedimentary material were the ne throughout. The shape of the bay at various ges from stright line to fully stable was mea-ed after various wave durations. It was found t the major curved portion of the water line was garithmic spiral, the constant of which varied oughout. A consistent pattern was observed for constant for the three wave approach angles 30 degrees, 45 degrees, and 60 degrees and the ee wave periods of 0.6, 1.0, and 1.4 seconds. nha-OEIS)

scriptors: *Waves (Water), *Sediment trans-t, Coasts, Sea walls, *Beaches, *Bed load, ravity waves, Turbulence, Boundary layers.
ntifiers: *Mass transport, Progressive waves, nding waves, Eddy viscosity.

e report describes a coordinated inquiry into h theoretical and experimental aspects of mass nsport by waves. Part I (Theory) begins with a review of the basic assumptions underlying existing theories. General formulas of mass transport velocity components throughout the Stokes boundary layer near a solid body are then derived; details of two examples are calculated. The three-dimensional mass transport distribution throughout the cross section of a wave tank is worked out for progressive waves of very small amplitudes. The effect of finite width is studied with the assumption that vorticity is diffused by molecular viscosity throughout the entire cross section. For a wave obliquely incident and reflected from a vertical sea wall, the structure in the second boundary layer between the Stokes layer and the inviscid core is investigated. This is appropriate for amplitudes much greater than the Stokes layer thickness. Part II (Experiments), was intended in part to check and to evaluate the theoretical deductions in Part I. In particular, extensive measurements were made for the longitudinal mass transport velocity in a progressive wave in a long tank with a smooth bottom. For standing waves and partially standing waves, possible features of erosion and deposition were observed by spreading (1) a small amount of sand on a smooth bottom and (2) a thick layer of sand on the bottom. The relevance of mass transport very near the bottom to the bed load transport is discussed in the light of the real beach environment. (Sinha-OEIS)

COMPUTER SIMULATION OF SHALLOW--WATER MARINE SEDIMENTATION,
Stanford Univ., Calif. Dept. of Geology.
J. W. Harbaugh, and G. Bonham-Carter.
Available from NTIS as AD-672 590, $6.00 paper copy, $1.45 microfiche. Final Report July 1968. 30 p, 4 fig, 5 ref. ONR-N 00014-67-A-0112-0004.

Descriptors: *Refraction (Water waves), *Sedimentation, *Shallow water, *Deltas, Mathematical models, *Simulation analysis, Computer programs, *Beaches, Marine geology, Bibliographies.

Four computer simulation models are discussed. (1) A stochastic delta model employing a constrained random walk technique was found to be unsatisfactory. (2) A deterministic delta model employing a jet velocity field produces a 'delta' narrow in plane view and sloping away from the source at angles less than 1 degree. Incorporation of a feedback regulator permits a 'mouth bar' and 'subaqueous levees' to build. (3) A 'beach' model incorporating wave refraction and turbulent diffusion of sediment is outlined. (4) A simple sedimentary basin model permits experimentation with sedimentation and subsidence rates and dispersal of sediment by wave action. A computerized bibliography on systems and simulation techniques relevant to geology has been set up, and now contains about 500 literature citations, each with keywords. Retrieval on the basis of selection criteria (keywords, title words, author and date) can be carried out using programs developed by the SPIRES system at Stanford. The framework for a general synthesis of simulation techniques as applied to geology, and sedimentation in particular, is laid out. (Sinha-OEIS)

SOURCE AND DISTRIBUTION OF SEDIMENTS AT BRUNSWICK HARBOR AND VICINITY, GEORGIA,
Army Coastal Engineering Research Center, Washington, D.C.
J. Neiheisel.
Available from NTIS as AD-620 873, $3.00 paper copy, $1.45 microfiche. Technical Memorandum No. 12, March 1965. 49 p, 17 fig, 5 tab, 46 ref, 2 append.

Descriptors: *Georgia, *Sediment transport, *Harbors, Coasts, *Beaches, Inlets (Waterways), *Tracers.
Identifiers: *Shoaling, *Heavy minerals, Barrier islands, Hornblende, Wave energy, Brunswick Harbor (Georgia).

The distribution patterns of bottom sediment in Brunswick Harbor and vicinity, Georgia, reflect the long-term hydrodynamic response and generally correlate with dynamic factors affecting sedimentation. Certain diagnostic minerals reflect the source area and are used as 'natural tracers' to delineate direction of sediment movement. Analysis of sedimentary parameters also enables interpretation of direction of sediment transport. The results of this investigation indicate that shaoling presently occurring in Brunswick Harbor is related to materials from a source in the Altamaha River. Sediment contribution to shoaling is introduced into the harbor through the tidal inlet between the barrier islands and from the MacKay River during greater than average discharge rates of the Altamaha River. Shoaling rates in the harbor also correlate with discharge rates of the Altamaha River. This investigation demonstrates the value of sediment interpretation, based on knowledge of regional geology, to provide a basis for analysis of sediment movement in a coastal area. In such a complex coastal area as Brunswick, Georgia, the sediment characteristics augment hydraulic measurements and enable a more complete interpretation of the hydrodynamics involved. Such information has application to engineering design of coastal structures. (Sinha-OEIS)

SEDIMENT TRANSPORT BY WAVES AND CURRENTS,
California Univ., Berkeley. Hydraulic Engineering Lab.
M. M. Abou-Seida.
Available from NTIS as AD-605 158, $6.00 paper copy, $1.45 microfiche. Technical Report No. HEL-2-7, May 1964. 48 p, 15 fig, 2 tab, 35 ref. DA-49-055-CIV-Eng-63-4.

Descriptors: *Sediment transport, *Waves (Water), *Currents (Water), Reviews, Boundary layer.

The first phase of the investigation was a library study of the work done pertaining to the phenomenon of the sand movement due to wave action. This survey provided information on the various techniques and procedures used; it also provided information about the different results obtained concerning the various phases of the study. With this information available, a preliminary laboratory study was carried out to compare the results with the various authors' findings and to check the applicability of the existing proposed methods for predicting the sediment transport due to wave action. The transition from liminar to turbulent boundary layer, turbulent velocity distribution near an oscillating wall, motion of sediment, the case of periodic waves, waves and currents, and sediment transport are described. (Sinha - OEIS)
W74-03111

CORRELATION OF LITTORAL TRANSPORT WITH WAVE ENERGY ALONG SHORES OF NEW YORK AND NEW JERSEY,
Army Coastal Engineering Research Center, Washington, D.C.
J. C. Fairchild.
Available from NTIS as AD-647 213, $6.00 paper copy $1.45 microfiche. Technical Memorandum No. 18, November 1966. 35 p, 12 fig, 3 tab, 14 ref.

Descriptors: *Refraction (Water waves), *Littoral, New York, New Jersey, Coasts, *Beach erosion, *Sediment transport, *Waves (Water), *Shallow water, Atlantic Ocean.
Identifiers: *Wave energy, Barnegat Inlet.

Results are presented of an office study which correlates certain field measurements of net littoral transport with the average net alongshore component of wave energy. It is carried out through a survey attempt toward a useful 'wave energy - littoral transport' correlation for a 500-mile stretch of the North Atlantic Coast by applying wave refraction analysis aided by interpolation techniques to waves hindcast from synoptic weather charts. The littoral transport rates were obtained from beach erosion control and other applicable reports of the study area. The results of the correlation developed between wave energy and littoral transport are presented in tabular and graphical form and compared to other 'wave energy - littoral transport' relationships. The correlation should be reliable within the limits of the data scatter. Near Barnegat Inlet, a nodal zone of littoral transport exists where the net transport rate computed over long periods has been found to approach zero. Material apparently moves away from this shore area, both to the north and to the south, as evidenced by a more consistent erosion pattern here than the intermittent patterns of erosion and accretion for the adjacent shores. There is general agreement among investigators that there is a nodal zone of littoral transport in the Barnegat Inlet area. It is important to note for this area the clear-cut minimum of net alongshore wave energy. In future studies of this nature the wave refraction effects should be considered to the breaker depth for each wave class and not to some arbitrary depth for all classes of waves, as was done in this study. Descriptors: *Humic acids, *Water chemistry, *X-ray diffraction, Analytical techniques, Water analysis, Colloids.

A procedure for the fractionation of humic acid samples from different environments involves fractionation of the sample by adsorption chromatography on a Sephadex G-50 column followed by chromatography on either a G-25 or a G-100 column. The fractions of the solutions are then examined by small angle X-ray scattering. Three different types of behavior were detected among the humic acid fractions: (1) some fractions show very little change in aggregation at pH values above 3.5; (2) one fraction forms aggregates at pH values above and below pH 7, but at pH 7 it is completely dissociated; (3) in some fractions the degree of aggregation decreases with increasing pH. However, even at pH values as high as 11.5 some large particles are still present. These differences in association behavior are due to the interaction of different attractive and repulsive forces. In many aggregating systems only one type of attractive force is dominant; however in humic acid systems hydrogen bonding, pi bonding between planar aromatic moieties, and other coulombic interactions apparently all play a role in the formation of molecular aggregates. OUTPUT OF PHOSPHORUS, DISSOLVED ORGANIC CARBON, AND FINE PARTICULATE CARBON FROM HUBBARD BROOK WATERSHEDS,
North Carolina State Univ., Raliegh. Dept. of Zoology.
J. E. Hobbie, and G. E. Likens.
Limnology and Oceanography, Vol 18, No 5, p 734-742, September 1973. 2 fig, 3 tab, 22 ref. NSF Grants GB 6742, GB 14289, and GB 14325.

Descriptors: *Nutrients, *Carbon, *Phosphorus, *Cycling nutrients, Sediment yield, New Hampshire, Clear-cutting, Water yield, Demonstration watersheds.
Identifiers: Hubbard Brook Experimental Watershed (NH).

The output of phosphorus, dissolved organic carbon (DOC), and fine particulate organic carbon (FPOC) was measured in two watersheds of the Hubbard Brook Experimental Forest, New Hampshire. One watershed had a cover of birch, beech, and maple; the other had been denuded of trees and regrowth prevented. Concentrations of DOC and dissolved plus fine particulate P changed little with changes in flow. Concentrations of FPOC, however, were strongly dependent on flow and most of the FPOC was exported during a few periods of high runoff. Deforestation caused higher runoff (by 26%), but also greatly increased erosion. Thus, DOC and FPOC output was similar in the two watersheds while the loss of large particulate phosphorus, mostly as inorganic bedload, increased 12 times in the treated watershed. With a rainwater input of 100 g of P per ha, there was an annual net gain of 87 g of P in the undisturbed watershed and a net loss of 104 g of P in the disturbed watershed. In view of the large amounts of phosphorus cycling in the natural forest (some 1,900 g of P per ha in annual leaf fall alone) this ecosystem is strongly conserving phosphorus. (Knapp-USGS)

THERMAL RADIATIVE PROPERTIES OF SMOOTH AIR-WATER INTERFACE,
Missouri Univ. Rolla. Dept. of Mechanical a Aerospace Engineering.
B. F. Armaly, A. L. Crosbie, D. C. Look, and H. F. Nelson.
International Journal of Heat and Mass Transfe Vol 16, p 1477-1487, 1973, 11 fig, 3 tab, 18 ref.

Descriptors: *Air-water interfaces, *He transfer, *Thermal properties, Water temperatur *Thermal radiation, Mathematics, Heat budg Model studies, Absorption, Temperatur Reflectance.

Thermal radiative properties for an air-water inte face were calculated by considering the interfa to be smooth and the water to be at uniform te perature. Monochromatic hemispherical and n mal reflectance, monochromatic and total norm transmittance, Planck mean and Rosseland me absorption coefficients were evaluated. The wa length interval covered by the calculations w between 0.2 and 200 microns. Other thermal radi tive properties, such as emittance and a sorptance, were related to the above properti and a comparison with available results sho favorable agreement. The use of these properti in the area of remote sensing and global ener balance makes the data essential for identifyi the most effective region of the spectrum and f explaining some of the naturally occurri processes where radiative transfer plays an impo tant role. MPERATURE OF MISSOURI STREAMS,
ological Survey, Washington, D.C. Water sources Div.
E. Bowie.
port prepared in cooperation with Missouri ological Survey and Water Resources, Missouri ter Pollution Board and Environmental Protec- n Agency, 1971. 168 p, 260 tab.

scriptors: *Missouri, *Streams, *Streamflow, emperatures, *Measurement, Water quality, uatic environment, On-site data collections, charge (Water), Seasonal, Diurnal, Instrumen- on, Thermometers, Standards, Water tempera- e.

eam flow temperature and water quality data ich have been collected by the U.S. Geological vey over many years in order to appraise Mis- ri's water resources are presented. All continu- records are summarized and data for all sites have 10 or more occasional temperatures are uded. The time of day date, and stream charges, at the time of day, date the observa- are given as an aid in determining the quality- perature relations in the water. The tempera- data presented were obtained with a sensing be in a flow-through chamber or by immersing ermometer. The accuracy is within a range of 2 rees F. for the ethyl-alcohol actuated thermo- h and plus or minus 5 degrees F for the ther- meters. Records are compiled in a downstream ction. Results indicated that streams in the thern part of the state have higher summer tem- atures and are frozen for longer periods during cold months of the year that streams in the thern part. Data are given for 260 stations. ome-Vanderbilt)

MPUTERIZED DIGITAL DATA ACQUISI- N SYSTEM FOR THERMOGRAVIMETRY SIMILAR APPLICATIONS,
eral Electric Corporate Research and elopment, Schenectady, N.Y.
omeo, E. Lifshin, M. F. Ciccarelli, and D. B. nsen.
lytical Chemistry, Vol 45, No 14, p 2444-2445, ember 1973. 4 fig.

criptors: *Computer programs, *Automatic rol, *Data transmission, Data collections, rication, Programming languages, Electronic pment.
tifiers: *Thermogravimetric analysis, *Data isition, FORTRAN, Digital display.

The data-recording method used in conjunction with continuous thermogravimetric analysis and precision electrobalances usually involves the use of a pen-recorder which can be coupled with an automatic range expander. The pen-recorder usually has a series of shortcomings which prove to be quite inconvenient to correct. As an alternative to the use of pen-recorders, a package has been designed which consits of a digital voltmeter (DVM), an interval timer, an elapsed time clock, and a teletype equipped with a digital data controller. A block diagram and the operation sequence of this digital system are presented. In addition to the application to thermogravimetry, the digital acquisition system can be used for monitoring and recording a variety of phenomena which involve either time-dependent parameters or, in general, up to three independent variables. All system components are commercially available as building blocks. Assembling of the system using commercial modules should be done with minimal design by any competent electronic staff. COMPUTER ANALYSIS OF DATA FROM POTENTIOMETRIC TITRATIONS USING ION--SELECTIVE INDICATOR ELECTRODES,
Hawaii Univ., Honolulu. Dept. of Chemistry.
A. F. Isbell, Jr., R. L. Pecsok, R. H. Davies, and J. H. Purnell.
Analytical Chemistry, Vol 45, No 14, p 2363-2369, December 1973. 3 fig, 3 tab, 24 ref.

Descriptors: *Computer programs, *Data processing, Volumetric analysis, Calibrations, Electrochemistry, Programming languages.
Identifiers: *Ion selective electrodes, *Potentiometric titration, *Data interpretation, *TITRATE, *Electroactive species, Precision, Experimental error, Argentometric titration, Silver electrodes, Analytes, Titrants, Equivalence points.

Although ion-selective electrode potentiometry simplifies end point determinations for many titrations and permits some previously impractical titrations, frequent electrode calibration is necessary. A computer program, TITRATE, has been developed which permits an accurate end-point determination for all titrations in which a few of the data points lie in a concentration region where meaningful potentials can be recorded. This computer technique locates the equivalence point in precipitation and complexation titrations in which either the analyte or titrant is electroactive. TITRATE analyzes only the meaningful data and computes the analyte concentration, the fraction of ideal Nernstian response, and the electrode formal potential. In addition, standard deviations, a comprehensive error analysis, and data which facilitate plotting both sigmoid and linear titration curves are computed. The versatility of ion-selective electrode potentiometry is enhanced by permitting the analysis of ions for which electrodes exist plus species which rapidly from precipitates or complexes with such ions. Examples of three argentometric titrations using a silver ion-selective electrode are presented. For analyses in which speed is a critical factor and electrode calibration is no problem, direct potentiometry is probably the best method of analysis. However, if accuracy rather than speed is critical, electrode calibration is troublesome, or if no ion-selective electrode exists but the unknown rapidly forms a complex or precipitate with an ion for which an electrode exists, then the method described above is ideal. The analysis time is not extreme, and all data analysis is performed by computer. Execution time for the complete analysis of data for one titration is usually between 1 and 2 seconds on an IBM 360/65 computer making the cost for computer time minimal. (Holoman-Battelle)

FRACTIONATION AND CHARACTERIZATION OF NATURAL ORGANIC MATTER FROM CERTAIN RIVERS AND SOILS BY FREE--FLOW ELECTROPHORESIS,
Geological Survey, Washington, D.C.
J. A. Leenheer, and R. L. Malcolm.
GPO, Washington, D.C. 20402 - Price $0.35 (paper cover). Water-Supply Paper 1817-E, 1973. 14 p, 4 fig, 2 tab, 13 ref.

Descriptors: *Organic matter, *Chemical reactions, *Surface waters, *Soils, Correlation analysis, Climates, Chemical analysis, Spectroscopy, Electrophoresis, Carbon, Fulvic acids, Color, Physical properties, Climatic zones, Degradation (Decomposition).
Identifiers: Polysaccharides, *Fractionation.

Soluble river organic matter and soil fulvic acids from a variety of environments were compared by examining the free-flow electrophoretic fractionation curves of organic carbon, color, and polysaccharides. Virtually colorless organic materials were found in both the soil and the river preparations. Polysaccharides comprised 20-75 percent of the colorless material in the soil fulvic acids but only 3.2-7.0 percent of the colorless material in the river preparations. Polysaccharides were complexed with organic materials having negative charges. Amounts of polysaccharides were greater in the Fairbanks soil from Alaska than in the soils from North Carolina or Iowa, and they were greater in the Tahquamenon River in Michigan than in the two rivers in Florida; this suggests that polysaccharide degradation is slower in cooler environments. For all of the organic preparations which were fractionated, the intensity of the yellow color increased as the charge on the organic anion increased. Highly colored, negatively charged organic material was present in greater amounts in the subsurface spodic soil horizon of the Lakewood and Fairbanks soils than in the surface mollic horizon of the Macksburg soil. Infrared spectroscopy and elemental analysis of four pooled fractions of the Fairbanks fulvic acid indicated increasing aromatic character with increasing negative charge. An increase in the carboxyl content with negative charge suggests the carboxyl group as the primary source of the negative charge. (Woodard-USGS)

INCORPORATION OF URANIUM IN MODERN CORALS,
Rensselaer Polytechnic Inst., Troy, N.Y. Dept. of Geology.
A. J. Amiel, D. S. Miller, and G. M. Friedman.
Sedimentology, Vol 20, No 4, p 523-528, November 1973. 4 fig, 1 tab, 16 ref.

Descriptors: *Uranium radioisotopes, *Coral, *Chelation, Water chemistry, Calcium carbonate, Reefs, Organic matter.
Identifiers: *Aragonite.

Uranium occurs in corals at three sites: (1) in organic matter; (2) adsorbed on the surfaces of skeletal aragonite; and (3) in the aragonite lattice. Organic matter incorporates from seawater by chelation 40-70 ppm uranium; skeletal aragonite incorporates only 3 ppm. However, as the organic fraction is low (0.1%) its high concentration of

uranium does not significantly affect the total concentration of uranium in the coral. A negligible concentration of uranium, 40-60 ppb, is adsorbed on skeletal aragonite from which it is readily leached or exchanged. This low concentration of adsorbed uranium (less than 2% of the total uranium in skeletal aragonite) is related to the very small specific surface area (1.5-1.8 sq m per g) of the corals. LITTORAL FAUNA ALONG THE NW COAST OF THE SEA OF JAPAN,
O. B. Mokiyevskiy.
Available from NTIS as AD-668 592, $6.00 in paper copy. Naval Oceanographic Office, Washington, DC Translation No 341, 1968. 118 p, 9 fig, 49 tab, 32 ref. Trans from Trudy, Institut Okeanologii. Vol 34, 1960.

Descriptors: *Littoral, *Coasts, *Aquatic plants, *Aquatic animals, Hydrography, Aquatic environment, Aquatic habitats, *Marine biology, Climatology.
Identifiers: *Sea of Japan.

Faunal and floral samples were obtained from the littoral and the upper edge of the continental coast of the Sea of Japan, namely between the gulfs z. Pos'yeta and z. De Kastri. The samples were obtained by the Far Eastern Coastal Expedition of the Institute of Oceanology in 1948. The close association of faunal composition, distribution and quantity with the plant world is analysed in detail. In addition, the effects of ground, coastal contours, exposure to waves, and influx of fluvial water are pointed out, comparing various coastal sectors and their flora and fauna. (Sinha-OEIS)

STUDY OF TIME VARIABILITY OF SURFACE CURRENTS AT A POINT IN MONTEREY BAY,
Naval Postgraduate School, Monterey, Calif.
H. M. Howton.
Available from NTIS as AD-756 574, $3.00 in paper copy. MSC thesis, December 1972. 114 p, 46 fig, 2 tab, 17 ref, 3 append.

Descriptors: *Bays, *Currents (Water), *California, *Diurnal, Tides, Winds, Computer programs, *Data collections, *Seasonal.
Identifiers: *Monterey Bay (Calif), Surface currents, Time variability, Coupling, Air-sea interactions.

The geomagnetic electrokinetograph (GEK) was used to measure surface currents near the center of Monterey Bay during six separate 24-hour periods from May through July, 1972. An average of 244 current vectors were derived for each cruise. The mean currents from these cruises are all southerly and ranged from 4.1 cm/sec to 20.4 cm/sec. The average of these mean currents is 12.1 cm/sec toward 163T. These values were compared with individual currents derived from dynamic topographies from the same period. Diurnal and semi-diurnal variations of the current were studied after subjecting the data to a Fourier analysis. It was concluded that there must be at least an indirect coupling of the ocean currents with the semi-diurnal tide at the data point. The diurnal component also is important; it may be tidal or inertial, or merely related to the passage of the sun. (Sinha-OEIS)

THE SOUTHERN MONTEREY BAY LITTORAL CELL: A PRELIMINARY SEDIMENT BUDGET STUDY,
Naval Postgraduate School, Monterey, Calif.
C. E. Dorman.
Available from NTIS as AD-683 662, $6.00 in paper copy. MSC thesis, December 1968. 234 p, 29 fig, 5 tab, 54 ref, 8 append.

Descriptors: *California, *Sediment transport, *Beaches, River flow, Winds, *Waves, Erosion, Seasonal, *Littoral, Bathymetry.
Identifiers: *Monterey Bay (Calif), Surf zone, Near shore, Longshore transport, Mass transport.

A sediment budget was developed for southern Monterey Bay, California. This budget is based upon sediment information obtained from field and laboratory studies. These studies included a detailed quasi-synoptic areal sampling to determine distribution of textural patterns, and a time-series study of beach and surf-zone sand samples obtained from local sand-mining companies. Results were combined with data on river discharge, the wind and wave regimes, and shoreline changes during the past century to develop quantitative estimates of sediment gains and losses to the cell. The major sources of sediment are the discharge from the Salinas River which empties into the northeast corner of the cell, and erosion of Quaternary seacliffs which form the inner bay shore. Major sinks are the Monterey Submarine Canyon, active coastal dune fields, the mining companies, and the offshore area. The recent history of the sediment regime in the southern bay is reviewed, and a forecast of future nearshore changes is made. Recommendations for further work needed to refine the budget computations are presented. (Sinha-OEIS)

HURRICANE SURGE FREQUENCY ESTI- MATED FOR THE GULF COAST OF TEXAS,
Army Coastal Engineering Research Center, Washington, D.C.
B. R. Bodine.
Available from NTIS as AD-684 894, $6.00 in paper copy. Technical Memorandum No. 26 February 1969. 38 p, 18 fig, 2 tab, 5 ref.

Descriptors: *Texas, *Hurricanes, *Storms, Water levels, Winds, Bays, *Flooding, *Coasts, Regression analysis, Frequency, Gulf of Mexico, *Surges, Gulf coastal plains.

Nineteen hurricanes of record since 1900 are used to derive a surge-frequency relationship representative of the entire Texas Coast. Pure statistical methods were not used because of the small number of recorded hurricanes and the lack of recorded data from early storms. The available data are treated by logic and reasoning to derive probable surge frequencies. A method is proposed for assigning frequencies to water levels of hypothetical hurricanes with various prescribed values of hurricane parameters - central pressure index, forward speed, and radius of maximum winds. Also a method is presented for estimating surge frequency in inland bays and adjacent regions subject to flooding by hurricanes. Results are presented in tables and curves. As new data become available, the developed scurves can be refined. (Sinha-OEIS)

COASTAL SAND DUNES OF GUERRERO NEGRO, BAJA CALIFORNIA, MEXICO,
Scripps Institution of Oceanography, La Jolla, Calif.
D. L. Inman, G. C. Ewing, and J. B. Corliss.
Geological Society of America Bulletin, Vol 77, p 787-802, August 1966. 7 fig, 5 tab, 23 ref, 4 plates. Nonr-2216 (23).

Descriptors: *Coasts, Mexico, Wind velocity, *Waves (Water), *Dunes, Shores, *Sediment transport, Climates.
Identifiers: *Mexico (Baja California), Barrier beaches.

A dune field of uniform 6-m high barchan ridges, about 40 square km in area, has blown inland from a barrier beach and has formed a partition of sand across the lagoon. The partition connects the barrier beach with the Baja California mainland. During 3.5 years of observation, the dunes advanced with a mean velocity of 18 m/year. This is equivalent to a discharge of 23 cu m of sand/m width/year. This discharge acting over the 1800-year life of the barrier beach, as dated by Carbon-14, is shown to be compatible with total volume of sand required to extend the dune field across the lagoon to the mainland. Observed travel rate of dunes was about twice that predicted from wind measurements. During high water accompanying spring tides, the floor of the interdune areas is inundated by water from the lagoons; thus, the windward margins of the dunes are subjected to the action of small waves generated by wind. The waves form miniature barrier beaches that are preserved as the dune migrates and serve as fortnightly and monthly time markers in the sediments. Avalanche bedding is the most common small-scale internal structure in the dune field. Gently sloping laminations associated with wind-blown ripples and with wave swash on the miniature barrier beaches are also common. (Sinha-OEIS)

TIDAL CURRENT SURVEYS BY PHOTOGRAMMETRIC METHODS,
Coast and Geodetic Survey, Washington, D.C.
M. Keller.
Technical Bulletin No 22, October 1963. 20 p, 10 fig, 5 tab, 13 ref, 3 charts.

Descriptors: *Surveys, *Coasts, *Photogrammetry, Water circulation, Meteorology, Bays, Harbors, Hydrologic data, *Tides, *Currents (Water), Photography, Data reduction.
Identifiers: Tidal currents.

Photogrammetric methods can provide accurate surface current measurements of large current velocities as well as smaller velocities down to 0.1 or 0.2 knot. Photogrammetry can provide synoptic measurements of a large area and thereby obtain more detailed circulatory information than is feasible otherwise. For the preparation of a current chart, photogrammetric measurements must be made in conjunction with current meter readings for proper reduction of the photogrammetric data. The data obtained from long periods of meter observation permit the removal of eccentricity introduced into the instantaneous photogrammetric observations by meteorological disturbances and the prediction of current velocities at future times. The Coast and Geodetic Survey plans to apply photogrammetry to current surveys as a production operation in the future whenever more detailed information is needed than can be readily obtained by conventional methods. WAVE INDUCED OSCILLATIONS IN HARBORS,
California Inst. of Tech., Pasadena. W. M. Keck Lab. of Hydraulics and Water Resources.
F. Raichlen, and A. T. Ippen.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 91, No HY 2, Proceedings paper 4241, p 1-26, March 1965. 14 fig, 1 tab, 17 ref, 1 append.

Descriptors: *Harbors, *Waves (Water), Energy, Resonance, Model studies.
Identifiers: *Wave energy, Coupling, Geometry, *Oscillations (Waves).

Of primary interest in this investigation are the wave-induced oscillations of a small rectangular harbor that is connected to a larger rectangular wave basin. This simple model system, devoid of any form of artificial energy dissipators, was studied experimentally and theoretically to determine with what degree of accuracy the arrangement could predict the resonant modes of oscillation of a similar harbor connected to the open sea. The effects of energy dissipators on the harbor response characteristics are examined briefly. Because of the high degree of coupling between the small rectangular harbor and its attendant wave basin, the response characteristics of the model harbor as a function of incident wave period were radically different from a similar prototype harbor connected to the open-sea. The effect of geometry and wave length in such a system makes the use of this type of model unrealistic for the investigation of resonance. Efficient wave absorbers and wave filters in the main basin are necessary to reduce this coupling effect. (Sinha-OEIS)

SEA WAVES IN COASTAL WATERS OF THE BRITISH ISLES,
M. Darbyshire.
Deutsche Hydrographische Zeitschrift, Vol 15, No 6, p 256-264, December 1962. 9 fig, 9 ref.

Descriptors: *Coasts, *Waves (Water), Winds, *Shallow water, *Fetch, *Ocean waves, Bays.
Identifiers: British Isles, Irish Sea.

Wave records obtained from the Smith's Knoll and Morecambe Bay light vessels are used to obtain relationships between wind speed and wave height and period in shallow water conditions for various lengths of fetch. Spectra obtained from data from the Smith's Knoll, Morecambe Bay and Seven Stones light vessels are presented. The spectrum formula for shallow water is found to be identical with that for deep water, found previously, with the same modifications for short fetch conditions. Relationships between wind and speed and wave height and wave period have been established for shallow water conditions. These are found to be substantially different to similar relationships for deep water conditions. The shallow water spectrum, however, is identical with that for deep water except in the case of the Irish Sea where there is some distortion of the spectrum shape. This may be due to the occurrence of both deep and shallow water in close proximity in this sea. (Sinha-OEIS)

Y. Nagata.
The Journal of the Oceanographical Society of Japan, Vol 20, No 2, p 57-70, June 1964. 15 fig, 2 tab, 3 ref.

Descriptors: *Sediment transport, *Beaches, Profiles, Sands, *Waves (Water), *Shallow water, Bottom sediment.
Identifiers: Suspended sediments, *Breaker zone, Orbital wave velocity, *Japan coast, Temporal pattern, Nearshore processes, Surf zone, Foreshore.

The horizontal velocities of orbital wave motion were measured by electromagnetic current meters. The deformations of temporal patterns of orbital wave velocity are discussed in respect to two typical beaches of gentle slope and steep slope. The results are examined together with the data on suspended sediments. A simple model on the mechanism of the balance of sediment transport in a cross-section perpendicular to shoreline is proposed and an explanation is given to account for the occurrence of coarse sands along steeply sloping beach and fine sands along gradually sloping beach. PARTITIONING OF THE ESTUARINE ENVIRONMENT BY TWO SPECIES OF CANCER,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
H. P. Jeffries.
Ecology, Vol 47, No 3, p 477-481, Spring 1966. 5 fig, 1 tab, 20 ref. PHS Grant WP-0023 and WP-00858.

Descriptors: *Rhode Island, *Crabs, *Bays, *Morphology, Temperature, Bottom sediments, *Estuarine environment, Habitats.
Identifiers: *Narragansett Bay (R.I.), Cancer irroratus, Cancer borealis.

There is little mixing of Cancer irroratus and C. borealis populations in Narragansett Bay, R.I. Cancer irroratus is found on sand, and C. borealis occurs in areas of coarse gravel and mixed rocky debris. The morphology, walking ability and serum of these crabs were examined to explain their separation in the bay. Walking ability was measured in a rotating jug. Cancer irroratus was at least five times more active and had a higher optimum temperature for walking than C. borealis. The optimum temperature for walking corresponded with distribution of both species on the east coast of North America: C. irroratus is most common in temperate waters, whereas C. borealis is a more northern, colder-water species. Cancer irroratus also had high concentrations of serum phosphate, which may be associated with its activity in nature. The concentrations of glucose, total nitrogen and chloride were the same in both species, presumably because their growth rates were similar and the salinity in both habitats was the same. Thus, C. irroratus is adapted for life on a flat, sand bottom where survival must depend upon an ability to run, catch food and escape from predators. C. borealis leads a reclusive life, hiding in crevices and relying upon its heavy claws for protection. Spatial partitioning of the bottom by Cancer is compared to temporal partitioning in the plankton by two species of Acartia. Competition within these groups might help to stabilize estuarine production. (Sinha - OEIS)

Identifiers: *Pacific salmon aquaculture program, *Puget Sound (Wash).

A project to demonstrate the feasibility of raising marketable pan-size salmon on a commercial scale in Puget Sound, Washington is described. A total of 211,000 salmon were successfully raised from eggs to an average marketable 12-inch size (approximately 340 grams) in 14 months using floating net pens. The following phases of the operation are described: incubation of eggs, freshwater cultivation in ponds, saltwater cultivation in net pens, stimulation of public awareness, and environmental monitoring. LARVAL FISH SURVEY OF HUMBOLDT BAY, CALIFORNIA,
National Marine Fisheries Service, Tiburon, Calif. Tiburon Fisheries Lab.
M. B. Eldridge, and C. F. Bryan.
For sale by GPO, Washington, D.C. 20402 - Price $0.25. National Oceanic and Atmospheric Administration Technical Report NMFS SSRF-665, December 1972. 8 p, 8 fig, 1 tab, 21 ref.

Descriptors: Fish, *Larvae, *Bays, *California, Surveys, Fish eggs, Bottom sampling, Sampling, Methodology, Nets, Fish types.
Identifiers: *Larval fish survey, *Humboldt Bay (Calif), *Fish species.

As part of a series of investigations of the marine resources of Humboldt Bay, Calif., a larval fish survey was conducted from January to December 1969. Bottom and oblique tows were made at five sampling stations with 1-m plankton nets on alternate biweekly intervals. Thirty-seven species of larval and juvenile fishes representing 17 families were collected. In terms of larval abundance, the dominant fish was the bay goby, Lepidogobius lepidus, followed by Pacific herring (Clupea harengus pallasi), Pacific staghorn sculpin (Leptocottus armatus), longfin smelt (Spirinchus thaleichthys), and the arrow goby (Clevelandia ios). These five species constituted 95% of all larvae captured. The number of larvae captured increased with increasing distance from the mouth of the Bay. The lowest number of species captured was at a station which experienced the widest range of salinities and temperatures. Peaks of seasonal abundance occurred in January and February and in April and May. Relatively few fish were captured after June. Some notable appearances of offshore spawned fishes occurred in Humboldt Bay. (Woodard-USGS)

CHECKLIST OF PUGET SOUND FISHES,
Washington Univ., Seattle. Div. of Marine Resources.
A. C. DeLacy, B. S. Miller, and S. F. Borton.
NTIS, Springfield, Va 22151 as COM-73-10072 - Price $3.00 printed copy; $1.45 microfiche. Washington University Sea Grant Program Publication WSG 72-3, July 1972. 43 p, 1 fig, 182 ref.

Descriptors: *Fish types, *Fish populations, *Sounds, *Washington, Reviews, Indexing, Bibliographies, Publications, Documentation, Classification.
Identifiers: *Fish species, *Puget Sound (Wash), Fish distribution.

A list of fishes constitutes a compilation of data on Puget Sound, Washington, fish species distribution up to 1971. It is compiled from literature from unpublished cataloged entries in the University of Washington collection of fishes, unpublished log records from the University of Washington College of Fisheries, University of Washington Department of Oceanography, University of Washington Friday Harbor Laboratories, Washington State Department of Fisheries, National Marine Fisheries Service, Municipality of Metropolitan Seattle, and other sources. Included is a bibliography, in alphabetical order by author, containing 182 related reports. (Woodard-USGS)
W74-03060

SEDIMENTATION ON THE WESTERN DELTA--FRONT OF THE FRASER RIVER, BRITISH COLUMBIA,
British Columbia Univ., Vancouver. Dept. of Geological Sciences.
J. L. Luternauer, and J. W. Murray.
Canadian Journal of Earth Sciences, Vol 10, No 11, p 1642-1663, 1973. 12 fig, 4 tab, 19 ref.

Descriptors: *Sedimentation, *Deltas, *Canada, *Erosion, Sediment transport, Alluvium, Sedimentary structures.
Identifiers: *Fraser River.

Sedimentation and erosion on the western delta-front of the Fraser River, Canada are described on the basis of a detailed sedimentological survey and three successive bathymetric surveys. The surveyed portion of the delta-front can be subdivided into three sedimentary environments: salt marsh, main platform, and upper foreslope. The salt marsh lies near high tide level and is a flat to hummocky, vegetated zone about 1 km wide, having sediments with a mean grain size finer than 0.063 mm. The main platform slopes gradually for about 6 km from the salt marsh to the break in slope at approximately 9 m below lowest normal tide level. It is mantled mainly with 0.35 mm to 0.125 mm rippled sand. The upper foreslope extends from the main platform to the limit of the bathymetric survey. The gradient of the upper foreslope is variable and attains a maximum inclination of approximately 12 deg. Upper foreslope sediments are muddy at and north of the main river channel, but consist mostly of sand south of there. The sharp transition between platform sand and muddy foreslope sediment north of the main channel suggests that the -9 m contour there is the maximum depth of vigorous wave and current action. As a consequence of local physical oceanography and confinement and dredging of the main channel, yearly freshet deposition is promoting the advance of the delta-front principally off the main channel and is sufficient to maintain the stability of the upper foreslope north of there. However, on the southern-most segment of the western delta-front, prevailing conditions have brought about the retreat of the upper foreslope during the period 1968-1972. (Knapp-USGS)
W74-03061

A HYDROLOGIC RECONNAISSANCE OF THE PASCAGOULA RIVER ESTUARY, MISSISSIPPI,
Geological Survey, Jackson, Miss.
D. E. Shattles.
Available from the National Technical Information Service as PB-226 570 $3.50 in paper copy; $1.45 in microfiche. Supplemental publication to the 8th Mississippi Water Resources Conference Proceedings, April 10-11, 1973, Vicksburg: Mississippi State University Water Resources Research Institute, 1973. 30 p, 25 fig. OWRR A-999-Miss (9a).

Descriptors: *Hydrologic data, *Water quality, *Estuaries, *Mississippi, Data collections, Channel morphology, Tidal waters, Tidal effects, Saline water intrusion, Streamflow, Tidal streams, Water level fluctuations, Surveys, Planning, Water resources development, Waste disposal, Recreation facilities, Navigation, Water supply, Hydrographs, Water pollution sources.
Identifiers: *Pascagoula estuary (Miss).

Increasingly, attention is centered on estuaries in Mississippi. These tidal reaches have tremendous potential for recreation, waste disposal, navigation, and water supply. Data are presented from an investigation of the Pascagoula estuary made by the U.S. Geological Survey in the late summer of 1972 in cooperation with the Pat Harrison Waterway District. The estuary extends inland about 42 river miles. Bottom profiles of the main channels of the Escatawpa, East Pascagoula, West Pascagoula, and Pascagoula Rivers were made using a recording fathometer. Tide gages were installed to determine the range in tide in the estuary, to determine times of low and high tides, and to assist in estimating how far upstream tides affect the water-surface elevation under average conditions. The degree of saltwater intrusion upstream depends principally upon freshwater discharge, tidal stage, and configuration of the river channel. The natural water quality of the Pascagoula estuary is very good. Freshwater inflow into the estuary is characterized by low concentrations of dissolved material and related substances. The high quality of water in the estuary is greatly reduced by municipal wastes, wastes from various wood products and wood-chemical plants, fish processing plants, chemical plants, and shipbuilding industries. (Woodard-USGS)

FIRST EXPERIMENTAL RESULTS ON THE DIFFUSION OF FRESH WATER IN A SHALLOW BAY,
Ente Nazionale per l'Energia Elettrica, Rome (Italy).
M. Pagliari.
Air and Water Pollution, International Journal, Vol 10, No 8, p 537-548, August 1966. 12 fig, 2 tab, 19 ref.

Descriptors: *Estuaries, *Bays, *Mixing, *Diffusion, Shallow water, Currents (Water), Waves (Water), Freshwater, River flow, Sea water.
Identifiers: Italian Coast, *Tyrrhenian Sea.

The Studies and Research Division of ENEL (Ente Nazionale per l'Energia Elettrica) in 1965 initiated experimental research on the diffusion of river water into the sea, under physically and topographically common conditions along the Italian coast; i.e. in shallow bays, where weak currents and small tide heights prevail. The experimental area was the Garigliano River and the Gaeta Bay, in the Tyrrhenian Sea between Rome and Naples. The general pattern of current was determined by launching a number of floats into the river, just upstream from the mouth, followed by a small boat, to ascertain their path and scattering. At several predetermined points water was sampled, in depths of 0.2, 1 and 2 m, as well as the sea bed; sea-bed samples were also taken. Water samples were analysed for their chlorinity, hardness, electrical conductivity and refractive index. Iso-haline and iso-hardness curves and profiles were drawn, showing a definite mixing pattern. Calculations were made for salt-wedge and the resultant freshwater depth at the river mouth; the diffusion of fresh water in the sea was also calculated by using the Pritchard continuous source formula. Theoretical and experimental values are in fairly good agreement with each other, but more experimental results are needed. (Sinha-OEIS)

A STUDY OF WATER CIRCULATION IN MONTEREY HARBOR USING RHODAMINE B DYE,
Naval Postgraduate School, Monterey, Calif.
F. Breidenstein, and D. M. Thomas.
Available from NTIS as AD-618 881, $6.00 paper copy, $1.45 microfiche. MSC thesis, 1965. 66 p, 20 fig, 4 ref.

Descriptors: *California, *Dye dispersion, *Water circulation, *Harbors, Rhodamine, *Tidal effects, Tracers.
Identifiers: Monterey Harbor (Calif.), *Tidal currents, Wind driven currents.

Rhodamine B dye was used to determine water circulation in Monterey Harbor. Point and line dye sources were traced visually, photographically, and by use of a fluorometer. The spreading of dye boundaries and the concentrations observed are presented in a time series of synoptic charts for each of the four surveys conducted. From these measurements, mean flow rates and a dye diffusion rate were determined. Circulation was found to be dominated by tidal currents, but wind-driven currents were important in the outer harbor. In the outer harbor, the circulation proved to be counterclockwise during rising tide, and clockwise during the falling tide. Flow was minimal in the inner harbor, or marina. Limited data indicate that the subsurface circulation agreed with the surface circulation in most of the surveys. (Sinha - OEIS)

CLEARWATER COASTAL ZONE MANAGEMENT PLAN.
RMBR Planning/Design Group, Tampa, Fla.

Prepared for Coastal Coordinating Council, Tallahassee, Fla. (1973). 66 p, 28 fig.

Descriptors: *Coasts, *Seashores, *Coastal marshes, *Florida, Shores, Beaches, Coastal structures, Zoning, Runoff, Storm runoff, Ecology, Gulf of Mexico.
Identifiers: *Coastal management, Clearwater (Florida), Tampa Bay, Environmental impact statements.

The objective of coastal zone management is to enable more environmentally conscious decisions to be made regarding use of coastal lands, including immediately adjacent lands having direct and

significant impacts on coastal waters. A pilot study for municipal level management was sponsored by the Florida Coastal Coordinating Council. Existing municipal objectives and proposed policies pertinent to management of Clearwater's two coastal zones (1) on Clearwater Harbor and the Gulf of Mexico and (2) on Old Tampa Bay were collected for evaluation in terms of environmental and urban impacts. Charts were used to facilitate systematic analysis. Data relevant to coastal zone development were collected, including existing land uses, circulation and drainage patterns, aquatic conditions, and completed projects and their observed impacts. After identifying problems and opportunities discovered in the analysis phase and developing supplemental objectives for shoreline management, a coastal land utilization plan and a shoreline management plan are developed. Actions, roles, and standards are recommended. An explicit amendment to the city's zoning ordinance, pertaining to waters and waterfront property is offered. The city is urged to formalize requirements for environmental impact statements; the study offers a checklist of relevant questions. Engineering considerations to minimize stormwater runoff are presented. (Stein - North Carolina)

DYNAMICS REVERSE OSMOSIS MEMBRANES OF ULTRATHIN DISCS,
Department of the Interior, Washington, D.C. (Assignee).
W. M. King.
U. S. Patent No 3,764,526, 7 p, 5 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 915, No 2, p 639, October 9, 1973.

Descriptors: *Patents, *Reverse osmosis, *Desalination, Cellulose acetate, *Water purification, Sea water, Potable water, *Membranes, Separation techniques.
Identifiers: Ultrathin membrane discs.

Dynamic membranes can be formed from suspensions of ultrathin membrane discs which are in themselves tiny reverse osmosis membranes. Ultrathin membrane discs may be prepared from a solution of a conventional membrane material such as cellulose acetate by spraying the solution at controlled conditions onto an appropriate casting surface. Numerous droplets are formed on the casting surface and the evaporation of the solvent from these droplets forms the membranes. After appropriate post casting treatments a dilute suspension of these membrane discs can be prepared and used in the formation of dynamic reverse osmosisi membranes. (Sinha-OEIS)
W74-03009

MGCO3 ADDITION TO CASO4 CONTAINING SEA WATER TO PREVENT CORROSION,
H. Tabata, N. Tabata, and R. Nakajima.
U. S. Patent No 3,766,019, 6 p, 5 fig, 3 tab, 12 ref; Official Gazette of the United States, Vol 915, No 3, p 1018, October 16, 1973.

Descriptors: *Patents, *Desalination, *Flash distillation, *Evaporators, *Corrosion control, Chemical reactions, Sea water, Fresh water, Water treatment, Magnesium carbonate, Calcium sulfate, Calcium carbonate.

A process is described for evaporating sea water with almost complete avoidance of corrosion of the steel materials on the flash evaporation apparatus. Magnesium carbonate is added to the sea water in an amount to react calcium sulfate dissolved in the sea water to such an extent that 5 to 10 percent of the original Ca++ remains dissolved in solution while forming a calcium carbonate precipitate. The precipitate is removed by filtration. The pH of the treated sea water is adjusted with a mineral acid to pH5.0 to 5.5. The treated sea water is deaerated at a rate exceeding 90 percent. The sea water is introduced into a stage of a flash evaporation apparatus in which the temperature is lower than 80 deg C. (Sinha-OEIS)
W74-03010

ELECTROLYTIC CELL FOR ELECTROLYSIS OF SEA WATER,
Daiki Engineering Co. Ltd., Tokyo (Japan). (assignee)
T. Itakura, T. Shoda, and T. Yamamoto.
U. S. Patent No. 3,766,045, 3 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 915, No 3, p 1024, October 16, 1973.

Descriptors: *Patents, *Desalination, Sea water, Potable water, *Electrolysis, *Water treatment, *Scaling, Electrolytes.

An electrolytic cell for direct electrolysis of sea water is described. The cathode plates are parallelly elongated upward and downward longer than the anode plates to prevent Mg (OH)2 from adhering to the cathode plates and further prevent impurities from depositing in the cell to increase the efficiency of the electrolysis. The cell includes a feed chamber below the electrolysis chamber, and an electrolyte takeoff-precipitate withdrawal chamber directly above the electrolysis chamber, with the outlet port from the electrolysis chamber coincident with the inlet port to the electrolyte takeoff-precipitate removal chamber. EVAPORATION RETARDATION BY MONOLAYERS,
California Univ., Berkeley. Dept. of Mechanical Engineering.
R. Greif.
Water Resources Research, Vol 9, No 6, p 1679-1680, December 1973. 6 ref. NSF Grant GI-34932.

Descriptors: *Monomolecular films, *Evaporation control, Convection, Hexadecanol, Hydrodynamics, Evaporation, Water vapor.
Identifiers: Hydrodynamic conductance.

The reduction in the rate of evaporation of water by hexadecanol monolayers is analyzed by considering the hydrodynamic boundary layer conductance and the vaporization step conductance (related to the migration of water molecules from the liquid water phase into the vapor phase). A value of 0.95 cm/sec was found for the vaporization step conductance. (Knapp-USGS)
W74-02774

WATER-USE BY RIPARIAN VEGETATION AT CATHEDRAL PEAK,
U. W. Nanni.
South African Forestry Journal No 80, p 1-10, March 1972. 9 fig, 2 tab, 9 ref.

Descriptors: *Demonstration watersheds, *Water loss, *Riparian water loss, *Water yield improvement, Streamflow, *Low flow, *Weirs, Base flow, Evaporation, Water vapor, Transpiration, Water utilization.
Identifiers: *South Africa, Portable weirs, *Vapor loss.

Two portable weir tanks fitted with a water-level recorder to measure flow up to 19 cubic meters per hour through a V-notch were installed in series 330 meters apart in the Gogodo Stream at the Cathedral Peak Forest Influence Research Station in the summer rainfall region of South Africa. After the streamflow had been gauged at both weirs for 14 days, most of the riparian scrub forest between the weirs was removed in one afternoon in August, the time of most stable base flow which coincides with the period when riparian vegetation starts to grow actively and to transpire strongly. The catchment above the weir, and neighboring catchments, served as controls against which to judge the changes in daily vapor loss and run-off induced by removal of riparian vegetation between the two weirs. Although statistical tests showed significant differences between the treated portion of the catchments and the controls, and non-significant differences between the controls, not all the conditions on which the tests were based were fulfilled and the results were therefore presented in graphical form only. The experiment showed that the use of small portable weir tanks is practicable and that the small increase of about 12 liters in daily run-off for every meter of streambank vegetation removed, is detectable. (DWA)

WEATHER MODIFICATION OPERATIONS IN CALIFORNIA, OCTOBER 1, 1968 - SEPTEMBER 30, 1969,
California State Dept. of Water Resources, Sacramento. Div. of Resources Development.
E. C. Greiner, and J. B. Powers.
State of Calif, Documents Section, P.O. Box 20191, Sacramento, Calif 95820 - Price $1.00. Bulletin No 16-69, June 1970. 14 p, 2 plate.

Descriptors: *Weather modification, *Cloud seeding, *Silver iodide, *California, Data collections, Artificial precipitation, Climatology, Cloud physics, Streamflow forecasting.

Within the reporting period, October 1, 1968, through September 30, 1969, nine licensees conducted 11 weather modification projects in California. During this period, all projects except fog dispersal projects dispersed some form of silver iodide (AgI) as the only nucleating agent. The fog dispersal projects used finely ground sodium chloride (NaCl) as the nucleating agent. The data are summarized. Days of cloud seeding reported are the days on which seeding operations took place. Seeding did not necessarily occur during all hours of the day. Because of heavy rains in January and February, many of the projects shut down ahead of schedule. (Woodard-USGS)

PUBLIC POLICY ALTERNATIVES AFFECTING WATER AND SEWER SERVICE IN URBAN GROWTH AREAS.,
North Carolina Univ., Chapel Hill.
K. B. Kenney.
Master's thesis 1964, 227 p, 1 fig, 7 tab, 264 ref.

Descriptors: *Planning, *Water supply, *Sewerage, Land use, Municipal water, Regulation, Groundwater, Urbanization, Cities.
Identifiers: Utility extension, Public policies, Public control.

State government influence on the provision of water and sewer service has been of considerable importance although many states have been slow in realizing their central role in assisting local government. Federal financial assistance has had a strong stimulating effect on the installation of public water and sewer services. The removal of the Federal tax advantage enjoyed by local government bonds would work against these programs and local investment in utilities. The city can regulate the geographical sequence of development in some degree by the policies it adopts concerning the extension of services. Municipalities whose practices are examined include Washington, D.C. and its Maryland suburbs, Baltimore, Bridgeport, the North Carolina Research Triangle, Denver, Grand Rapids, and others. Also explored in detail are the policies of Greensboro, Winston-Salem, Durham, and Raleigh in North Carolina, noting contrasts and similarities in policies and their effects on urban development. Policies in all four seem to have been designed to encourage compact development, although Greensboro has probed further. Basic contention is that public control of groundwater, and of public water supply, and of waste water disposal practices would give more complete control of urban development and that it may represent a strong tool for effectuation of desired patterns of urban growth. (Edwards - North Carolina)

NORTH CAROLINA WATER PLAN PROGRESS REPORT: CHAPTER 19: POWER AND WATER.
North Carolina State Dept. of Water and Air Resources, Raleigh.

Draft Report, November, 1970. 142 p, 18 plates, 128 ref, 5 append. Title III P. L. 89-90, WRP Act.

Descriptors: *Power plants, *Water resources development, *North Carolina, Hydroelectric plants, Thermal power plants, Nuclear power plants, *Planning, Water resources, Cooling.
Identifiers: *Power plant sites, Siting.

Mechanical, conventional hydro-electric, pumped-storage hydro-electric, and thermal power from both fossil and nuclear sources are the five methods of power development which entail utilization of water resources. This volume surveys development of water-related power in North Carolina, identifies considerations for siting of future power plants, and recommends state actions relevant to power plant siting. The roles of federal and state agencies active in power generation and distribution in North Carolina are discussed. Existing power plants and their generating capacities are identified. General service areas of private power companies are mapped. Potential sites for power plants are located and the conclusion is drawn that thermal sources will supply most of the state's future power need. Suitable water supplies for cooling are the greatest problem related to thermal plant siting. Other items for consideration in siting are foundation conditions, earthquake likelihood, tornadoes, hurricanes, and floods. It is recommended that (1) the State strengthen its long-range planning, giving special attention to the North Carolina Water Plan, (2) a power plant siting law be enacted, coordinated by the State Utilities Commission, (3) the siting law should specify agencies advirsory to the coordinating body, (4) the siting law specify that recommendations of advisory agencies be conclusive in matters where existing law places on them a regulatory authority, and (5) that the State Planning Division should study need and develop form of a state land-use plan. FUNCTIONAL WATER AND SEWER REPORT,
Colorado School of Mines, Golden.
D. Whitney, and H. Swanson.
Prepared for Larimer and Weld Regional Planning Commission, Greeley, Colorado. April, 1973. 47 p, 2 fig, 4 maps, 5 tab, 2 append. HUD 701.

Descriptors: *Water supply, *Sewerage, *Project planning, Planning, Urbanization, Cost analysis, Financing, Sewers, *Colorado.
Identifiers: A-95 Review, Areawide planning, *Capital improvements, Fort Collins (Colo).

Several applications for functional water and sewer planning and programming certification by the U.S. Department of Housing and Urban Development are discussed. Under the A-95 review program the Larimer-Weld Regional Planning Commission reviews all local projects for water and sewer improvements that require federal assistance. The review is based on comprehensive plans and planning guides for the two-county region. At present, two applications have been certified by HUD; these are the Estes Park Basin Plan and the Fort Collins-Boxelder Program. Various elements of a Functional Water and Sewer Plan for the Urbanizing Portion of the Region are presented. These include plans for Fort Collins for water and sewer, capital improvements for Loveland, and capital expenses for Greeley. Specific project requests are ordered in terms of priority and include a description and location of the project, its cost, financing, timetable for completion, and justification. Journal of the Irrigation and Drainage Division American Society of Civil Engineers, Vol 99, No IR4, Proceedings paper No 10229, p 421-439, December 1973. 4 fig, 38 ref.

Descriptors: *Water resources, *Irrigation efficiency, *Crop production, *Evapotraspiration, *Droughts, Estimating, Computer programs, Mathematical models, Optimization, Planning, Management, Climate, Soil water, Systems analysis, Profit, *Water utilization.
Identifiers: Agricultural products, Economic analysis.

Water economists and engineers require methods for developing water-production functions useful in quantitatively estimating yields, profits, or both, for principal irrigated crops under water-deficit conditions. Discussed is a well-advanced research program which is aimed at quantitative prediction of relations between principal crops and water. The goals are to: (1) estimate functional relations between crop yield (Y) and water at all water supply levels, water being defined as seasonal depths of both evapotranspiration (ET) and irrigation (IRR); and (2) optimize water management by maximizing profit or water use efficiency. Conflicting reports from experiments in containers and in the field have been reconciled to illustrate basic relations between crop growth and water use. Approaches are outlined for estimating Y versus ET functions dependent only on crop variety and climate. The functions show maximum yield at any seasonal ET level, and minimum ET at any level of Y. Thus defined, the Y versus ET functions assume factors other than water to be nonlimiting, as well as optimal timing and intensity of planned ET deficits. Elements under consideration are those required in a model for elaborating normative Y versus IRR functions which reflect optimal irrigation programming with respect to maximizing either yield or net income at all water levels. INVESTIGATION ON THE ECOLOGY AND CONTROL OF WILD OAT (AVENA FATUA L.) UNDER THE CONDITIONS IN WROCLAW VOIVODESHIP, (IN POLISH),
Instytut Uprawny Nowozenia i Gleboznawstwa, Wroclaw (Poland).
H. Pejka.
Pamiet Pulawski. 46 p, p 83-119. 1971. Illus. (English summary).
Identifiers: *Avena-Fatua, Beet, Control, Ecology, Germination, Herbicides, *Oats, *Poland (Lower Silesia), Sugar, Wheat.

Avena fatua L. is widespread in Lower Silesia. It occurs in cereals, root crops, flax and leguminous cultures. The aggressiveness of this species in relation to the cultivated plants grows with the intensity of its occurrence per unit area. One of the factors favoring the spread of wild oats on arable fields is the seed vitality, another is the ecological conditions under which development may occur. The seeds show a full germination capacity in the second and third year after physiological maturity. Seeds may germinate from a depth of 18 cm. Humidity and air conditions of the soil are important. The growth and development of A. fatua may occur under different soil moisture conditions but both drought periods and excess water have a negative effect on productivity. The control of wild oats in the field cultures is difficult. The most effective method of destroying this weed is the application of suitable herbicides in connection with the agrotechnique of the field cultures. Methods useful for spring wheat and sugar beets are outlined.--Copyright 1973, Biological Abstracts, Inc.

LOSS OF NITROGEN FROM VARIOUS NITROGEN FERTILIZERS ON IRRIGATED LAND,
P. V. Protasov, and G. D. Korosteleva.
Soviet Soil Science, Vol 4, No 5, p 566-570, Sept-Oct. 1972. 4 tab, 13 refs. (Translated from Agrokhimiya, No 10, 1972).

Descriptors: *Cotton, *Nitrogen compounds, *Fertilizers, *Application methods, Leaching, Plant growth, Environmental effects, Soil analysis, Soil chemical properties, *Irrigation effects.
Identifiers: *Uzbekistan (USSR).

Each year the cotton-growing farms of Uzbekistan apply large quantities of nitrogen fertilizers to the crop, some of which is taken up by the plants, some is fixed by the soil microflora, and some migrates into the deep layers and groundwater because of the high mobility of nitrogen compounds. Nitrogen losses were studied under laboratory conditions after addition of various forms of nitrogen to the soils of the irrigated zone of Uzbekistan. The experiment was performed in polyethylene tubes 2.0 m high and 4.2 cm in diameter, with each containing 3.5 kg of soil. The soil was packed 1.6 m high in the tube and evenly compacted mechanically and then by wetting. When dry, nitrogen fertilizers were added to a depth of 3 cm at a rate of 100 mg of N/kg of soil. The soil was watered 5 times for 3 months at a rate of 7000 cubic meters/ha. At the end of the experiment, the soil was analyzed layer by layer for its content of ammonia and nitrate nitrogen to assess the main losses of fertilizer nitrogen from the soil. Losses of nitrogen from different forms of nitrogen fertilizers through irrigation were observed in all soils in the irrigated zone. Losses from hygroscopic and readily available nitrate fertilizers were high. Differences were noted in this respect between the ammonia and amide forms of fertilizers. Leaching to deep layers accounted for most nitrogen fertilizer losses. (Black-Arizona)

WATER REQUIREMENTS OF VARIOUS CROPS IN ARID AND SEMI-ARID ZONES OF TURKEY,
Soil Conservation Research Inst., Ankara (Turkey). Irrigation and Drainage Div.
O. Beyce.
In: Cento Seminar on Agricultural Aspects of Arid and Semi-arid Zones, September 19-23, 1971, Tehran, Iran, Central Treaty Organization 1972, p 191-211. 18 tabs.

Descriptors: *Water requirements, *Crop production, Arid climates, Semiarid climates, Land use, *Irrigation practices, Irrigation programs, On-site data collections, Hydrologic models, *Evapotranspiration.
Identifiers: *Turkey.

A discussion of Turkey's general climate, present land use patterns, effects of irrigation on yields of 10 crops in various parts of Turkey, and a brief history of irrigation practices of this region are presented. Locations of research stations currently engaged in irrigation research are also given. Raw data from the reports and files of these stations have been compiled since 1969 and monthly consumptive use values evaluated for the crops of their respective area. Some of these data are presented in tabular form. Current research emphasizes the process of creating models to cor-

relate data with climatic factors. A hydrological water balance equation has been simplified to: (R + I) - (E) ± plus or minus S, where R ± precipitation, I ± irrigated water, E ± evaporatranspiration, and S ± change in water storage. This equation was used to estimate monthly evapotranspiration values for various crops in different locations in Turkey, and experimental results are presented in 9 tables for wheat, alfalfa, sugar beets, cotton,potatoes, beans, melons, tomatores, and sesame. MEASURES FOR BETTER UTILIZATION OF IRRIGATION POTENTIAL IN THE ARID AND SEMI-ARID ZONES OF WEST PAKISTAN AND A PROPOSAL FOR FUTURE COORDINATED RESEARCH ACTIVITIES IN THIS FIELD SUITED TO THE CENTO REGION,
Irrigation Research Inst., Lahore (Pakistan).
S. M. Ayoob, and I. Ahmad.
In: Cento Seminar on Agricultural Aspects of Arid and Semi-arid Zones, September 19-23, 1971, Tehran, Iran, Central Treaty Organization 1972, p 51-89. 6 figs, 8 tabs.

Descriptors: Water resources development, Water storage, *Water loss, Seepage, Reservoir evaporation, Evaporation, Transpiration, Water consumption, *Water management (Applied), Arid lands, Research and development, *Irrigation, Efficiency, Asphalt concrete, *Canal linings, *Retardants.
Identifiers: *West Pakistan.

A discussion is presented of the general climate of West Pakistan, its water potential and water losses at various stages (e.g. seepage; evaporation from reservoirs, ponds, and bare soil; transpiration; and conventional irrigation practices), and the current pressure being exerted on the resources of this region by an increasing human population. Possible ways to conserve water are outlined by: (1) reducing seepage losses by lining irrigation canals, (2) proper alignment of watercourses, (3) keeping watercourses free from weeds, (4) reducing losses from free water surfaces via retardants, e.g. oils, alcohols, and emultions of mineral and vegetable oils, (5) minimizing losses from bare soil and transpiration from plants by maintaining water tables at optimum depths with proper drainage measures, (6) improving irrigation practices by cultivating in blocks for better watercourse alignment, using basin and furrow irrigation to prevent over- or under-irrigation, and using sprinklers instead of conventional gravity irrigation to avoid heavy water loss from percolation resulting in waterlogging and increased salinity, and (7) using underground asphalt barriers to prevent infiltration and rising up of water. A proposal for future coordinated research (a) emphasizes the use of asphalt as canal lining material, (b) recommends the establishment of an agro-chemical complex as a prerequisite for making asphalt barriers a success, and (c) lists 16 prospective planned studies which will increase understanding and technical knowhow in asphalt barrier technology and point the way for future research is instituted. DIFFERENTIAL TOLERANCE OF SIX LEGUMINOUS CROPS TO TERBUTRYNE,
Hebrew Univ., Rehovot (Israel). Dept. of Field and Vegetable Crops.
A. Eshel, and B. Rubin.
Israel Journal of Agricultural Research, Vol 22, No 1, p 11-15, April 1972. 2 tab, 1 fig, 5 ref.

Descriptors: *Herbicides, *Weeds, *Legumes, Resistance, Crop production, Transpiration, Photosynthesis, Consumptive use, Water loss, Toxicity, Crop response, Plant physiology.
Identifiers: *Terbutryne.

Terbutryne (4-ethylamino-2-methylthio-6-t-butylamino-1,3,5-triazine) is a new herbicide recently introduced for selective control of annual broadleaved and grassy weeds in various crops to reduce interspecific competition with crop plants and soil water loss through transpiration. The effect of the herbicide on photosynthesis and top growth was studied in six legumes: broad beans, chickpeas, peanuts, peas, snap beans, and soybeans. The terbutryne used in all experiments was a wettable powder formulation. The effect on photosynthesis was evaluated by measuring the evolution of oxygen from illuminated leaf discs by a manometric technique in a Gilson differential respirometer. The phytotoxicity of terbutryne was studied by growing the six legume species in clay soil (43 percent sand, 20 percent silt, 37 percent clay, and 1.5 percent organic matter at pH 7.4) containing the herbicide. The various crops responded differently, the most resistant species being peanuts. Soybeans and snap beans were most susceptible, whereas broad beans, peas, and chickpeas were intermediately susceptible. Localized applications of terbutryne to different soil layers indicated that the herbicide was absorbed by roots but not by the emerging shoots of the six species. Field tolerance of the intermediate and highly susceptible legumes is probably due to the fact that the plants do not absorb the herbicide because it is absent from the root zone. (Black-Arizona)

THE SEASONAL GROWTH OF LOVEGRASS (ERAGROSTIS CURVULA) ON DEEP SANDY SOILS IN A SEMI-ARID ENVIRONMENT,
Commonwealth Scientific and Industrial Research Organization, Wembley (Australia). Div. of Land Resources Management.
P. Farrington.
Australian Journal of Experimental Agriculture and Animal Husbandry, Vol 13, No 63, p 383-388, August 1973. 4 fig, 1 tab, 16 ref.

Descriptors: *Forage grasses, *Plant growth, *Sands, *Seasonal, *Australia, Rainfall, Semi-arid climates, Crop production, Water supply, Distribution, Crop response, Moisture availability, Limiting factors.
Identifiers: *Lovegrass.

The use of sub-tropical grasses for pastures in deep sandy soils in Mediterranean-type environments has not been examined in detail in Australia. In 1965, a detailed study was begun to study the seasonal growth characteristics of lovegrass and its potential as a perennial pasture grass on deep sandy soils in the Western Australian wheatbelt at 20 deep-sand sites near Meckering. The sites covered a representative range of sand types and topographical situations within a 6 km sq area, and three plots (2.4 x 4.2 m sq) were established. Each plot contained 10 sample plants of a robusta green type of lovegrass spaced on a 60 cm grid in two rows of five plants surrounded completely by single guard rows. After an establishment phase of nine months, the plots were harvested on 14 occasions, mostly at eight-week intervals. The seasonal growth pattern of lovegrass resulted in over 80 percent of annual dry matter yield being produced outside the period of most effective rainfall (April-August). Yields were considerably higher than that of annual pastures on similar soils. Highest grass yields were obtained at sites with a water table within 150 cm of ground surface. Lovegrass is unlikely to succeed at sites without a water table because of inadequate moisture availability in summer. Also, slow growth rates in winter (reduced ability to compete with winter-growing annual pasture species) and low nutrient concentrations during the warmer months are likely to limit its forage value to stock. A STATISTICAL APPROACH TO DYNAMIC MODELING AND CONTROL OF WATER DISTRIBUTION SYSTEMS,
Polytechnic Inst. of Brooklyn, N.Y.
R. DeMoyer, Jr.
Available from the National Technical Information Service as PB-226 604, $12.25 in paper copy, $1.45 in microfiche. Ph.D. Thesis, June 1973. 188 p, 34 fig, 20 tab, 92 ref, 4 append. OWRR C-3166 (3734) (2).

Descriptors: *Water distribution (Applied), *Statistical models, *Dynamic programming, *Simulation analysis, *Operating costs, Optimization, Regression analysis, Demand, Time Networks, Pipe flow, Pumps, Rainfall, Temperature, Effects, Equations, Mathematical models, Systems analysis.
Identifiers: Kalman filters, Tank depths, Cost minimization.

An overall system study of the automatic control of elevated storage dominated water distribution systems is presented. The control objective opts to maintain adequate customer pressure and to minimize operating costs while keeping system variables within constraints. A high speed statistical water distribution system model has been developed which makes possible automatic control by dynamic programming. The model consists of empirical relations whose unknown coefficients are obtained from the analysis of operating data, providing a system simulation much faster than conventional network models explicitly calculating all pipe flows. The model is kept abreast of system changes by employing regression recursively by means of a Kalman filter. To implement dynamic programming control, demand data are analyzed to produce a predictable mean value function. Time varying demand analysis determines which weekdays have significantly different demand curves and the effects of weather and temperature on water consumption. Calculated are time varying thresholds of tank depths which, when crossed, require discrete pump changes to take place. The control minimizes pumping energy while maintaining tank depths within given constraints. Simulation of control of a pressure district in Philadelphia shows a 4.9% saving in pumping energy. Operating cost is reduced by holding tank depths lower and more constant than the wide tank depth excursions experienced under the 'floating tank' policy. (Bell-Cornell)
W74-02673

FLOOD CONTROL PROJECT PLANNING BY MATHEMATICAL PROGRAMMING: A PROJECT-EXPANSION APPROACH,
Illinois Univ., Urbana.
G. Cortes-Rivera.
Available from the National Technical Information Service as PB-226 349, $15.00 in paper copy, $1.45 in microfiche. Ph.D. Thesis, 1973. 243 p, 38 fig, 39 tab, 100 ref, 3 append. OWRR B-060-ILL (3).

Descriptors: *Water resources development, *Project planning, *Flood control, *Linear programming, *Dynamic programming, *Methodology, *Land use, Economics, Reservoirs, Optimization, Hydrologic aspects, Agriculture, Timing, Size, Structures, Discount rates, Inflation (Economic), Institutional constraints, Levees, Systems analysis, Mathematical models.
Identifiers: Embarras River Basin (Ill).

A methodology for planning comprehensive flood control projects which allows the identification of optimum flood control plans over the planning period is developed. Flood-hydrology analysis provides information on the probability of occurrence of a given flood in any year of the planning period. Parametric linear programming is used to determine the optimal agricultural land-use policy corresponding to any given combination of magnitudes of the project's structural components (The non-structural component of the project is the agricultural land-use of the tracts protected by levees). Discrete differential dynamic programming is presented for finding the optimal timing and size of the expansions of the structural components. Optimal expansions of the project are given for several values of economic parameters including the discount rate, the rate of land-value differential inflation, and budgetary and institutional constraints. The methodology is applied to a one-detention reservoir, two-levee flood control project for the Embarras River basin in Illinois. (Bell-Cornell)
W74-02674

CHANCE-CONSTRAINED MODEL OF SYSTEM OF RESERVOIRS,
Texas A and M Univ., College Station. Dept. of Industrial Engineering.
G. L. Curry, J. C. Helm, and R. A. Clark.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY12, Proceedings paper No 10246, p 2353-2366, December 1973. 3 fig, 2 tab, 11 ref.

Descriptors: *Multiple-purpose reservoirs, *Optimization, *Stochastic processes, *Probability, Hydraulics, Water resources, Decision making, Computer programs, Inflow, Demand, Constraints, Equations, Time, Mathematical models, Systems analysis.
Identifiers: *Chance-constrained programming, Nonlinear separable programming, Operating policy, *Reservoir levels.

Chance-constrained programming is used to model a system of linked multipurpose reservoirs. The model objective is to determine an optimal operating policy for a given time sequence of minimum and maximum reservoir levels. The unregulated inflows into the reservoirs are assumed to be stochastic with a known distribution for each time frame. The chance-constraints, based on material balance equations, are converted to an equivalent linear deterministic constraint set. The linked system model is a natural extension of the single reservoir model. The problem of stochastic demands as well as stochastic inflows is shown to be a straightforward generalization of the stochastic inflow problem. Since the resulting constraints for these models are linear and the decision variables are deterministic rather than random variables, linear, quadratic, and even general convex objective functions can readily be handled. (Bell-Cornell)
W74-02676

DEVELOPMENT OF A MARGINAL ANALYSIS CAPABILITY FOR WATER RESOURCES SIMULATION MODELS,
Cornell Univ., Ithaca, N.Y. Water Resources and Marine Sciences Center.
E. McBean, and J. Schaake, Jr.
In: Proceedings of the Summer Computer Simulation Conference, Montreal, P.Q., Canada, July 17-19, 1973. 12 p, 9 fig, 11 equ, 18 ref.

Descriptors: Water resources development, *Planning, *Reservoirs, *Simulation analysis, *Markov processes, Analytical techniques, Estimating, River basins, Streamflow, Reservoir releases, Reservoir storage, Optimum development plans, Benefits, Equations, Design, Systems analysis, Mathematical models, Computer models.
Identifiers: *Marginal analysis, Search techniques, Gradient vectors, Response surface, Marginal value estimates.

A procedure is described that, given the information obtained from a single fun of a simulation model, allows estimation of the gradient vector of a response surface for a water resources planning problem. This gradient information is then useful in combination with a search procedure to significantly increase the efficiency of search for the optimal water resources plan configuration. The basis for the gradient estimator is developed from a probabilistic Markov model of the reservoir state transitions from one time period to another. The marginal analysis capabilities arise by recognizing how the reservoir transitions would be changed by modification of decision variables. The behavior of the gradient estimator is examined under several conditions in application to a simple example problem. (Bell-Cornell)

RIVER BASIN AUTHORIZATIONS AND RELATED WATER RESOURCE PROJECTS.

Hearings--Subcomm. on Water Resources of the Comm. on Public Works, U.S. Senate, 93d Cong, 1st Sess, April 30, May 1, 2, 3, and 11, 1973. 1076 p, 15 fig, 10 tab.

Descriptors: *Flood control, *Flood protection, *Watershed management, *Government finance, *Federal government, Economic efficiency, Water resource development, Legislation, Water policy, Administration, River basins, Planning, Mississippi river basin, Political aspects, Rivers and Harbors Act.

The hearings were directed at determining the potential value of flood control and related water resource projects in preventing or minimizing the effect of some future flood or water shortage. Agenda included sixteen river basin monetary authorization requests, about a dozen legislative proposals, and four additional projects not included in any bill at that time. The Army Corps of Engineers gave testimony and presented reports in reference to the flood ravaged Mississippi Valley as well as to the need and importance of authorizing funds for specific water resources and river basin projects throughout the country. Witnesses included Senators, Representatives, mayors, and other representatives of business, government and education. Testimony of all witnesses was primarily directed toward obtaining authorization and federal financial aid for projects in their specific locality. Also included are statements and report

by persons not present, texts of proposed legislation, detailed report of projects currently in operation, and letters and commentaries by various individuals or groups interested in the particular projects or the program in general. Maps, charts, and tables are presented for support throughout the hearings. (Conko-Florida)

BAYLANDS SALT WATER FLOOD CONTROL PLANNING STUDY.

Report to the Santa Clara County Flood Control and Water District. January, 1973. 160 p, 27 plates, photos, 30 tab, 4 append.

Descriptors: *Flood control, *Levees, *Estuaries, *Wetlands, Ecology, *Saline water, Planning, Land use, Soils, Geology, Environmental effects, Financing, Institutions, Design criteria, *California.
Identifiers: *San Francisco Bay (Calif.), Santa Clara County (Calif.), Baylands, San Jose (Calif.).

Santa Clara County is located at the southern shallow end of the San Francisco Bay. Both fresh water and salt water flooding has become an increasing problem as urbanization continues. The Santa Clara County Flood Control and Water District presently is responsible for fresh water flooding and this study is focused on determining whether the District should also be responsible for salt water flooding control. The study identifies the flooding problems in an area up to 10 feet above sea level and evaluates possible solutions as a basis for policy-making by the District. Separate chapters are devoted to local and regional agencies with water resource functions in the area, municipal and county planning policies, population and land use projections, ecological relationships in the Baylands, local geology and soils, design criteria for flood control works, and the economics and financing of proposed projects. Some of the general findings are: that the existing levees do not provide adequate protection from salt water flooding, that flooding problems have been intensified by subsidence of the low-living Baylands, that the ecology and the soil characteristics of the area are very important, and that future land use demands in the County can be met without using the wetland areas. (Elfers-North Carolina)

BURNING AS A SUPPORTING TREATMENT IN CONTROLLING WATERHYACINTH IN THE SUDAN. PART I. ROUTINE BURNING,
Khartoum Univ. (Sudan). Faculty of Science.
B. F. Mohamed, and F. F. Bebawi.
Hyacinth Control Journal, Vol 11, p 31-34, 1973. 5 fig, 2 tab, 1 ref.

Descriptors: *Burning, *Ultimate disposal, *Water hyacinth, *Aquatic weed control, Harvesting, Dehydration, Seeds, Germination.
Identifiers: *Sudan, White Nile (Sudan).

Sporadic heaps of mechanically removed waterhyacinth and naturally stranded communities, both located along the banks of the White Nile, form nuclei for probable future local reinfestations. Burning such potentially threatening centers is an inevitable precaution, which has been practiced since 1960. Quick burning is timesaving and therefore economical. Influence of wind upon relative burning efficiency was investigated. Experiments were performed in Gulli (Dueim District, Sudan) May to June 1971. Confining burning to March and April is suggested as by March both natural accumulations and heaps are sufficiently dehydrated; also, burning in March safeguards against prolonging opportunity for dispersal. Early burning would undoubtedly destroy vegetatively dormant forms which might otherwise remain to rejuvenate when moisture requirements are met as the climatic conditions become favorable with a progressive increase in relative humidity. Dry, spongy-textured waterhyacinth would resist burning or at least render operations less efficient. Possible amendments to routine burning practices under Sudan conditions are suggested. The generation of high temperature in routine burning builds up better efficiency in suppressing seed and vegetative regeneration at innumerable potential centers of reinfestation. (See also W74-02919) (Jones-Wisconsin)
W74-02918

BURNING AS A SUPPORTING MANAGEMENT IN THE CONTROL OF WATERHYACINTH IN THE SUDAN. PART II. BACKBURNING,
Khartoum Univ (Sudan). Faculty of Science.
B. F. Mohamed, and F. F. Bebawi.
Hyacinth Control Journal, Vol 11, p 34-37, 1973. 1 tab, 1 fig, 13 ref.

Descriptors: *Burning, *Aquatic weed control, *Water hyacinth, Management, Ultimate disposal, Harvesting, Germination, Seeds.
Identifiers: *Sudan, White Nile (Sudan).

Heavy infestation of waterhyacinth obstructs navigation, impedes normal water flow causing stagnation, hinders fishing, and chokes irrigation canals along the greater part of the 600-km stretch of the White Nile. The primary aim of burning has been to destroy seeds before favorable conditions commence which permit germination and successful establishment of new plants. How backburning would enhance the destruction efficiency inflicted upon the potentially dangerous seed crop of waterhyacinth was investigated. Position of the seeds at the time of burning is critical. Heat generated by the traditional headburning procedure is, undoubtedly, sufficient to kill seeds engulfed in the litter of the upper strata in any form of accumulation, however, since such heat does not normally penetrate to the ground surface underlying seeds may not be destroyed. Maximum destruction is accomplished in excessively hot and more lasting fire associated with backburning heaped, dry waterhyacinth components. Natural accumulations respond favorably to backburning and a fairly complete destruction is obtained, though under moderate temperatures and shorter duration than in heaps. Heaps undergoing headburning leave incompletely burnt centers and a fair amount of coarse remnants on the ground surface. (See also W74-02918) (Jones-Wisconsin)

SMALL MAMMALS INCREASE ON RECENTLY CLEARED AND SEEDED JUNIPER RANGELAND,
Bureau of Sport Fisheries and Wildlife, Provo, Utah.
M. F. Baker, and N. C. Frischknecht.
Journal of Range Management, Vol 26, No 2, p 101-103, March 1973. 2 tab., 4 ref.

Descriptors: *Animal populations, Pine trees, *Rodents, Damages, *Small animals (Mammals), *Juniper trees, Range management, *Vegetation regrowth, Revegetation.
Identifiers: Pinyon-juniper.

Although rodents are known to contribute to the failure of revegetation efforts in some plant types, little is known of small mammals in the pinyon-juniper type or of their reaction to range renovation projects. Small mammal numbers were sampled by snap trapping on six areas in central Utah where juniper range had been cleared and seeded. Results from untreated, old juniper stands were compared with those from areas which were: (1) chained two times and seeded, (2) chained, windrowed, and seeded, and (3) chained, windrowed, seeded, and the windrows burned. On one area, which was trapped both before and 3 years after treatment, numbers of deer mice (Peromyscus maniculatus) and pocket mice (Perognathus parvus) increased greatly in the first 2 years following treatment, then declined sharply to a level which was still higher than before treatment. On two areas which were trapped for two years after treatment, many more small mammals were caught in the second year. Older seedlings had about the same number of small mammals as did untreated juniper. Small mammals showed a clear preference for windrowed slash. This was particularly true of deer mice and long-tailed voles (Microtus longicaudus). (Black-Arizona)

VEGETATIVE RESPONSE TO CHEMICAL CONTROL OF BROOM SNAKEWEED ON A BLUE GRAMA RANGE,
Wyoming Univ., Laramie. Div. of Plant Science.
R. W. Gesink, H. P. Alley, and G. A. Lee.
Journal of Range Management, Vol 26, No 2, p 139-143, March 1973. 1 tab, 3 fig, 17 ref.

Descriptors: *Herbicides, Plant growth, *Range management, Plant physiology, Vegetation, *Plant ecology, Grasses, Desert plants, Cacti, Forage grasses, Gramma grasses, *Chemcontrol, *Wyoming.
Identifiers: Needle-and-thread, *Broom snakeweed.

Relatively little information is available regarding the long-term effects of herbicides used to control undesirable plants on native rangeland, particularly as they influence non-target components of the plant community. This study evaluates vegetative change on a blue grama (Bouteloua gracilis) range in southeastern Wyoming five years after herbicide treatment. Herbicide applications were: Silvex: 2 and 4 lb/acre; picloram (Tordon), 0.5 and 1 lb/acre; picloram w/2, 4-D, 0.25 + 1 lb. and 0.5 + 2 lb/acre respectively. The treatments were initially made to investigate their effeectiveness in controlling broom snakeweed (Gutierrezia sarothrae) which was in abundance on the site. Silvex treatments did not control snakeweed. Recent investigations suggest that this occurred because treatments were applied too late into the growing season after the plants had developed beyond more susceptible growth stages. All rates of picloram, either along or in combination with low rates of 2, 4-D effectively controlled broom snakeweed. Picloram also eliminated the low amounts of plains pricklypear (Opuntia polyacantha) present among the dense stands of snakeweed. Blue grama was initially injured by the 0.5 and 1 lb/acre rates of picloram, but needle-and-thread (stipa comata) was damaged only by the 1 lb/acre rate. This initial injury to the grasses had a renovating effect upon the range, and, in combination with the elimination of undesirable plants, resulted in notable range improvement as measured 5 years after treatment. (Black-Arizona)

PRESCRIBED BURNING ROTATIONS ON PINE-BLUESTEM RANGE,
Forest Service (USDA), Pineville, La. Southern Forest Experiment Station.
H. E. Grelen, and L. B. Whitaker.
Journal of Range Management, Vol 26, No 2, p 152-153, March 1973. 1 tab, 4 ref.

Descriptors: *Burning, *Range grasses, Range management, *Forage grasses, Livestock, Forage palatability, *Seasonal, Winter, *Grazing, *Louisiana.

Burning one-third of grazing units in late winter or early spring adequately distributes grazing and maintains forage quality on southern pine cattle ranges. Recent investigations on ungrazed range have indicated, however, that forage quality might be further enhanced by burning smaller patches in winter, spring, and summer. Two adjacent 80-acre grazing units of the Palustris Experimental Forest near Alexandria, La., were selected for the study. All commercialsized pines were removed several years before the study began, and large hardwoods were killed by herbicide injections. In open areas, dense grass, principally pinehill bluestem (Andropogon divergens) and slender bluestem (A. tener) was interlaced with blackberry briers (Rubus sp.). Exclusion of fire and grazing had allowed an increase of cutover muhly (Muhlenbergia expansa), an early-maturing grass that is unpalatable to cattle in the full-leaf stage. A different third of one unit was burned each March 1 (winter). Approximately three-sevenths of the other unit was burned each year--one-seventh in winter (March 1), one-seventh in spring (May 1), and one-seventh in summer (July 1). Seasonal burning offered no apparent advantage over winter burning in beef production. With proper stocking, the one-third of the range burned in winter of the current year was grazed almost continuously by the entire herd. Because different thirds are burned in the 2 years following heavy use, the plants had 2 years of light grazing in which to regain vigor. Thus, close grazing accomplished on the winter-burned range what the delayed burns did on seasonally burned range. (Black-Arizona)

RUSSIAN-THISTLE (SALSOLA) SPECIES IN WESTERN UNITED STATES,
Cincinnati Univ., Ohio. Dept. of Biological Sciences.
J. C. Beatley.
Journal of Range Management, Vol 26, No 3, p 225-226, May 1973. 10 ref.

Descriptors: Halophytes, *Desert plants, *Systematics, Southwest U.S., *Poisonous plants, Population, Distribution patterns, Range management, *Weeds, California, Nevada, Utah, Arizona, Genetics.
Identifiers: *Russian thistle.

Russian-thistle has been treated in the plant manuals and floras as a single species, usually as Salsola pestifer A. Nels. or S. kali L. The purpose of this report is to record, for the information of those who deal with these noxious weeds on western rangelands and elsewhere, that Russian-thistle populations in western United States consist of either of two species, or both, and are distinguishable at all stages in the field. S. pestifer is now replaced by an earlier name, S. iberica. The second species, S. paulsenii, prevails in many areas, especially in the Southwest. Where growing together, they appear to hybridize freely resulting in populations exhibiting varying degrees of genetic introgression. Both species and their genetic intergrades are known to occur in a number of areas in California, in the southern part of Nevada, in southern and northwestern Utah, and in Arizona; but S. paulsenii is not known from Colorado. It is probable that both occur to some extent throughout the western U.S. especially over the Intermountain Region, and that S. paulsenii is more prominent at lower elevations in the southwestern part of the country, and that S. iberica is the prevailing species of the higher elevations and latitudes of the West. Definitive geographic distributions are dependent upon future recognition of the two species and collecting of the genus in all of the western states. (Black-Arizona)

LOWER WISCONSIN RIVER VALLEY SOIL RESOURCES AND USE POTENTIALS,
Wisconsin Univ., Wasusau. Univ. Extension.
G. E. Musolf, and F. D. Hole.
Trans Wis Acad Sci Arts Lett. 60. p 201-209. 1972. Illus.
Identifiers: Agriculture, Conservation, Recreation, Resources, Rivers, Soils, Valley, Water conservation, *Wisconsin River, *Land use, *Zoning.

Erosion control practices, planting of trees in shelterbelts and plantations, and protection of woodlands from grazing have resulted from a growing awareness by the inhabitants of the need for soil and water conservation and from technical assistance provided to land operators by the Soil Conservation Service and the College of Agricultural and Life Sciences working through cooperative Extension. Recreational activities and residential developments have increased in the area. Recent elevation of standards for the protection of quality of water and other components of the environment, and an increasing appreciation of the scientific, asthetic and recreational values of this principal environmental corridor of Wisconsin point to the need for a practical land zoning system in the valley. It is advantageous to base the zoning on the detailed soil maps that are now available, along with interpretive overlay maps and zoning directives that regulate land use according to site characteristics.--Copyright 1973, Biological Abstracts, Inc.

THE CALIFORNIA STATE WATER PROJECT SUMMARY: NINETEEN-SEVENTY-TWO, APPENDIX C.
California State Dept. of Water Resources, Sacramento.

Bulletin No 132-73, (1973). 31 p.

Descriptors: *Water resources development, *Project post-evaluation, *California, State governments, Water policy, Water supply, Water demand, Water pollution control, Ecology, Flood control, Water quality control, Recreation facilities, Reviews, Project planning, Projections.
Identifiers: *California State Water Project (1972).

The end-of-year status of the California State Water Project is described in this extract from the California Water Commission's November 1972 report on its annual progress review (required by California Water Code Section 165) of project construction and operations. The commission's inspection showed that the State Water Project is achieving or surpassing its goals in diverse fields of accomplishment: (1) it is conserving and delivering water from Plumas County to Los Angeles County for use in homes, farms, and factories; (2) it is starting its second decade of water service in the San Francisco Bay Area; (3) it is readily meeting 1972's sharply increased water needs, caused by the near-drought conditions this year; (4) it is providing family recreation and sport fishing in northern, central, and southern California; (5) its smog-free generation of electric powerls helping to meet increasing energy requirements; (6) it is providing flood control and water quality control; (7) it is maintaining its construction schedule as it nears completion of its first phase; and (8) it is proceeding as a fiscally sound utility, financed by the beneficiaries. (Woodard-USGS)

WATER RESOURCES OF THE PONCE AREA, PUERTO RICO,
Geological Survey of Puerto Rico, San Juan.
N. E. McClymonds.
Commonwealth of Puerto Rico, Water-Resources Bulletin 14, 1972, 26 p, 15 fig, 3 tab, 4 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater resources, *Water yield, *Puerto Rico, Water quality, Rainfall-runoff relationships, Hydrologic data, Streamflow, Water wells, Aquifer characteristics, Hydrogeology, Groundwater movement, Groundwater recharge, Water utilization, Irrigation, Water supply, Water analysis, Chemical analysis, Water balance.

The movement of water in the Ponce area, Puerto Rico, is summarized for August 1964 to July 1965. Because the study was made during a drought, it is apparent that water in the Ponce area is probably

sufficient to satisfy present needs for both agriculture and man. The 31,000 acre-ft of streamflow to sea represents a substantial surplus that could be utilized. Some part of the 23,000 acre-ft (estimated) of ungaged runoff and groundwater drainage, presumably, could be salvaged also. The water generally is of good quality for most uses. It is estimated that 32,000 acre-ft of groundwater was pumped during the study. Water levels declined considerably in 1964 and 1965, and much greater than average rainfall would be needed to restore the levels of the early years of record. Return flow of irrigation water from both wells and canals is of considerable importance in maintaining the hydrologic balance. If the quantity of irrigation water applied were to be reduced, and if pumpage were to be continued at or near present rates, groundwater levels would decline progressively. Studies of means of artificially recharging the aquifers may be of prime importance if industry were to replace agriculture in the area. (Woodard-USGS)

POTHOLE COMMUNITY MANAGEMENT FOR LIVESTOCK AND WILDLIFE IN THE INTERMOUNTAIN REGION,
Forest Service (USDA), Logan, Utah. Cache National Forest.
F. Gunnell, and G. Smith.
Range Manage. Vol 25, No 3, p 237-240. 1972. Illus.
Identifiers: Ecological studies, Grazing, Livestock, Mountain regions, *Potholes, Waterfowl, *Wildlife, *Land management.

Potholes are depressions of glacial origin occurring on the prairies of northern United States and in some of the Intermountain glaciated valleys. Intermountain potholes provide excellent wetland habitat for numerous species of migratory waterfowl, waders, game and non-game marsh associated birds. Most of the Intermountain pothole areas are located on public lands and are important sources of water for grazing livestock. Grazing is compatible with wildlife needs if ranges are not overgrazed or livestock concentrated around available watering sites. This study was made with the intent of presenting a management plan whereby wildlife and livestock could jointly occupy these pothole areas of the forest lands of the northern Intermountain Forest Region USA to the benefit of both. Ecological stability rather than environmental competition was the goal with application over wide areas of the intermountain west. The study identifies opportunities in designing range developments to complement waterfowl and other species of wildlife on glacial terrain--Copyright 1973, Biological Abstracts, Inc.

LOWER WILLAMETTE RIVER MANAGEMENT PLAN.
ERG Partnership, Portland, Oreg.
Second Draft. August 23, 1973. 65 p, 17 fig, 4 photos, 3 append.

Descriptors: Rivers, Harbors, Navigable rivers, Planning, Dredging, *Oregon, *River regulation, *River basin development.
Identifiers: *River managment, *Willamette River, Portlant (Oregon), Waterfronts, Filling, Riverbanks.

A study team drawn from federal, state, and local regulatory agencies developed management guidelines for the Willamette River from the Sellwood Bridge in Portland to the Columbia River. Need for guidelines was accentuated by receipt of applications to fill or cover 88 acres of the river in 1972 alone. A streamlined procedure for administering permits for river and riverbank alterations is outlined. The management plan is composed of general policies for the entire area governing repetitive actions, management policies applied to 24 gegraphic zones, and conditions placed upon permitted river and riverbank alternations--dredging, fills, structures, and miscellaneous alterations. General policies include minimizing loss of river surface area, encouraging creation of new water surface area, maintenance of water quality, and preservation of unique natural sites. A description, an identification of unique features, and particular management guidelines are given for each geographic zone. Land management policies are not binding upon regulatory agencies not party to the management plan. Twenty supplemental recommendations regarding urban waterfront management are offered. An appendix provides a summary of meetings, interviews, data, maps, and charts on which the plan is based. (Stein - North Carolina)

FLOOD PLAIN INFORMATION FOR HARRIS FORK CREEK AND SOUTH FULTON BRANCH, FULTON, KENTUCKY AND SOUTH FULTON, TENNESSEE.
Army Engineer District, Memphis, Tenn.

Prepared for the Cities of Fulton, Kentucky and South Fulton, Tennessee. August, 1971. 35 p, 9 fig, 8 plates, 11 tab., photos.

Descriptors: *Flood protection, *Land use, *Flood damage, *Flood frequency, Flood control, Flooding, Flood profiles, Flood flow, Flood plains, *Tennessee, *Kentucky, Urbanization.
Identifiers: *Flood plain management, Fulton (Kentucky), South Fulton (Tennessee), Harris Fork Creek (Kentucky and Tennessee), South Fulton Branch (Tennessee).

Intended as an aid in solving local flood problems and in planning the best use of the land that lies in the flood plain, this study examines the general conditions and flood history of Fulton, Kentucky and South Fulton, Tennessee located in the upper portion of the Harris Creek Fork drainage basin. Much of the primary business and residential development is located within the flood plains of Harris Fork Creek and South Fulton Branch. Major floods occurred in 1945 and 1957 and flooding continues today since the Corps of Engineers has no existing authorized flood control measures on the two streams within the study area. The characteristics of both streams are similar--relatively straight channels, rectangular basins generally used for agriculture, and overbank areas heavily developed with a combination of business and residential structures. Based on an analysis of the rainfall and runoff characteristics of the general region surrounding the area under study, projections for Standard Project (largest likely to occur) and Intermediate Regional (once in 100 years) Floods are developed, with special relevance to the various adjacent land uses. Maps, profiles and photographs indicate the extent of previous flooding and of flooding that could occur in the Future under present conditions. (Edwards - North Carolina)

FLOW CHARACTERISTICS OF A SUBSURFACE-CONTROLLED RECHARGE BASIN ON LONG ISLAND, NEW YORK,
Geological Survey, Mineola, N.Y.
R. C. Prill, and D. B. Aaronson.
Journal of Research of the U S Geological Survey, Vol 1, No 6, p 735-744, November-December 1973. 14 fig, 1 tab, 7 ref.

Descriptors: *Infiltration, *Recharge ponds, *New York, *Artificial recharge, Soil water movement, Groundwater recharge, Pit recharge, Storm runoff, Water reuse, Surface-groundwater relationships.
Identifiers: Long Island (NY).

At the Woodbury recharge basin on Long Island, N.Y., the principal zones controlling infiltration are a surface-loam stratum and an intermediate gravelly, sandy loam stratum. The saturated hydraulic conductivities of these strata are 0.90 and 0.1 ft per day, respectively. The surface loam acts as the principal zone controlling infiltration

until a perched groundwater mound develops above the intermediate gravelly, sandy loam and extends to the bottom of the surface loam; then the intermediate gravelly, sandy loam becomes the principal infiltration controlling zone. Infiltration rates at 15.6 deg C are 1.4 ft per day when the surface loam is acting as the principal controlling zone and 0.5 ft per day when the intermediate gravelly, sandy loam is acting as the principal controlling zone. Projections of the probable infiltration rates associated with both the partial and the complete removal of the surface-loam stratum show that if recharge continues for several days total infiltration would not be greatly different whether or not the loam stratum is completely removed. The principal advantage of completely removing the surface-loam stratum is the resulting greater infiltration capacity during the early stages of ponding. This advantage is offset by potential problems associated with more intensive clogging of the subsurface controlling zone. (Knapp-USGS)

DIVERSION OF FLOOD FLOWS FROM THE CONNECTICUT RIVER AND THE EFFECT ON GROUNDWATER SUPPLIES,
Massachusetts Univ., Amherst. Dept. of Geology.
O. C. Farquhar.
Journal of the New England Water Works Association, Vol 87, No 3, p 218-231, September 13, 1973. 3 fig, 10 ref.

Descriptors: *Groundwater, *Groundwater recharge, *Water management (Applied), *Connecticut River, Water supply, Diversion, Connecticut.
Identifiers: Quabbin Reservoir (Conn).

There are plans to divert water from the main stem of the Connecticut River near Northfield Mountain, Massachusetts to the Quabbin Reservoir, where it will eventually flow by an existing aqueduct to the Boston metropolitan area. Diversion would occur only when flow at a nearby gaging station exceeded 17,000 cfs. which could be in only the spring months when snows melted in the Green and White Mountains. Water would flow to Quabbin by gravity through tunnels yet to be constructed. The proposed diversion of 72 mgd from the river at Northfield would lower the river 0.2 foot at that location. The amount to be diverted by flood skimming is about 1% of the average annual flow. The 0.2 foot drop in river level due to diversion would not significantly affect ground water remaining in the Connecticut River, especially since there are no major aquifers in the floodplain. However, more distant future proposals call for diverting water which would lower the river one foot. The effects of this drop on groundwater quantity are more difficult to predict. If 1970 Corp of Engineers study recommendations were adopted, over 200 new dams would be built in the Connecticut watershed and flows would never reach the 17,000 feet needed for diversion. (Stein - North Carolina)

STIMULATION MODES OF GEOTHERMAL AQUIFERS,
Stanford Univ., Calif.
H. J. Ramey, Jr., P. Kruger, and R. Raghavan.
Paper presented at special session on Geothermal Energy Stimulaton, American Nuclear Society, Las Vegas, Nevada, June 19-20, 1972. 35 p, 6 fig, 4 tab, 19 ref.

Descriptors: *Geothermal studies, *Electric power production, *Aquifers, *Nuclear engineering, Thermal water, Hot springs, Steam, Thermal powerplants, Mechanical engineering, Water quality, Groundwater, Hydrogeology, Porosity, Recharge, Nuclear explosions.

The stimulation of geothermal aquifers through the use of nuclear explosions is feasible if a considerable amount of heat can be recovered from a large volume of fractured rock and a long term fluid production is forecast. Since heat conduction rates of dry rock are not sufficient for replacement of removed heat within reasonable time limits, a porous geothermal aquifer must be a component of a geothermal steam resource suitable for commercial development. The energy available from different geothermal reservoirs varies. Heat may be recovered from rock by boiling a liquid within the pore space, or recycling colder fluid back into the formation. Steam-bearing and hot-water aquifers are compared. Vapor pressure differences for flat and curved liquid surfaces, two-phase flow, and salt concentrations are some factors affecting the boiling of the liquid. The chemical quality of the stimulated geothermal water is of importance. Forecasting production is discussed. Surface flashing, receding flashing, and cyclic production with two chimneys are modes of operation which affect production. Fluid expansion, vaporization of liquid, gravity drainage as well as the influence of fluids from adjacent or underlying aquifers are all mechanisms under which the reservoir can operate. (Tirfie-Vanderbilt)

HYDRODYNAMICS OF ARTIFICIAL GROUNDWATER RECHARGE (SATURATED FLOW THEORY),
California Univ., Irvine. School of Engineering.
A. C. Amar.
Available from the National Technical Information Service as PB-226 637 $15.50 in paper copy; $1.45 in microfiche. Ph D Thesis, 1973, 221 p, 72 fig, 7 tab, 154 ref, 4 append. OWRR C-3112 (3687) (1).

Descriptors: *Artificial recharge, *Groundwater recharge, *Hydraulic models, *Hydrodynamics, Analytical techniques, Saturated flow, Soils, Sands, Hydrogeology, Geomorphology, Geology, Groundwater movement, Aquifer characteristics, Water quality, Mathematical studies, Equations, Darcys law, Theoretical analysis, Correlation analysis, Evaluation, *Reviews, *Bibliographies.

Use of artificial groundwater recharge as an effective means of reclaiming low-quality water has grown steadily since its inception late in the nineteenth century. As a prerequisite to an optimum design of a recharge system the practicing engineer must be able to predict with reasonable accuracy the hydrodynamic behavior of the proposed system for a given geometry and recharge operation. This study describes the hydrodynamic behavior of a (typical) water recharge system under saturated flow conditions and methods, through the use of a sand model and mathematical models/for the prediction of the transient and steady-state hydrodynamic behavior of the proposed system. The results of the investigation are considered significant in determining the authenticity and the accuracy of the accuracy of the various theories over a wide range of parameters relating to the hydrodynamics of the recharge operation. A comprehensive literature survey as well as an extensive bibliography are also included. (Woodard-USGS)

GROUNDWATER MOVEMENT,
Bureau of Reclamation, Washington, D.C.
R. E. Glover.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402 - Price $0.50. Engineering Monograph No. 31, 1966. 76 p, 22 fig, 5 tab, 32 ref.

Descriptors: *Groundwater, *Aquifer, *Drawdown, *Permeability, Irrigation water, Artesian well, *Canal seepage, New Mexico, Rio Grande River.
Identifiers: *Dupuit-Forchheimer equations, Laplace equations, Mesilla Valley, Bank storage.

Analyses are presented of a variety of groundwater problems encountered in the planning and development of Bureau of Reclamation water resources projects in the western United States including depletion caused by pumping, estimates of seepages, computation of return flows, analysis of drawdown, and estimates of permeabilities for selection of pump capacities. The solutions to the problems stated are generally based upon the Dupuit-Forchheimer idealization, which is justified only where the water table gradients are small compared to unity and the changes of groundwater level are small compared to the original saturated depth in the aquifer. The theoretical assumptions and limitations are outlined and specific problems are computed through the use of charts, tables and the solution of equations derived from the theoretical considerations. Some comparisons of observed and computed values are presented to judge the effectiveness of the method of solution. (Campbell-NWWA)

GROUND WATER IN THAILAND,
Department of Public Works, Bangkok (Thailand). Provincial Water Supply Div.
K. Anambutr.
Paper presented at National Water Well Association International Groundwater Symposium, November 20-22, 1973, Macquarie University, Sydney, Australia. 5 p, 3 ref.

Descriptors: *Groundwater, *Planning, Feasibility, Water resources development, *Water yield, *Aquifer characteristics, Water table aquifers, Artesian aquifers, *Water quality.
Identifiers: *Thailand (Yom basin), Five-year plan.

The expansion of agriculture and industry, the rapid growth of population, and the desire to secure a higher standard of living have resulted in an increased use of water in Thailand and has placed a great emphasis on water resources development. The government of Thailand has defined a third 5-year plan for investment in the development of water resources for agriculture, industry, and domestic use. The groundwater potential of Thailand is described generally with respect to aquifer characteristics, water quality, and yields obtainable. Particular emphasis is placed on the groundwater objectives in the northern region of the country, which are as follows: To make a preliminary assessment of the groundwater resources; to identify the areas where groundwater might be extracted; to evolve criteria for groundwater development; to examine the feasibility of groundwater development; to recommend further studies necessary before large scale development of groundwater resources. (Campbell-NWWA)

DESIGNING FOR FUTURE EXPANSION--DEVELOPMENT OF GROUND WATER IN INDIA,
Uttar Pradesh Irrigation Dept., Lucknow (India).
N. C. Saksena.
Paper presented at National Water Well Association International Groundwater Symposium, November 20-22, 1973, Macquarie University, Sydney, Australia. 22 p, 8 fig, 9 ref.

Descriptors: *Groundwater, *Wells, Recharge, Alluvial aquifers, Water supply development, Water utilization, *Planning, *Groundwater resources, Canals, Irrigation.
Identifiers: *Tritium tracer studies, *India (Uttar Pradesh), Strainer wells, Cavity wells, Tubewells.

A rapidly expanding economy, together with revolutionary advances in agriculture, has brought into focus the necessity of accelerated development and utilization of all water potential in India, with particular emphasis on groundwater. Drought conditions laid further emphasis on the use of groundwater, and today there are more than 30,000 state-owned deep tubewells and half a million private shallow wells in operation in the country. The systematic development of groundwater in India is described along with design to meet the following future needs: Direct irrigation facilities in areas of arable land in arid regions; supplementing canal supplies through the entire length, or specifically at the tail end of canals; removing water-logging conditions and augmentation of supplies; creating groundwater storage areas; utilizing groundwater from surplus to deficit areas. The safe groundwater potential of the country available for development every year is estimated to be about 165 million acre ft., of which 81 million acre ft. has been developed as of 1972. STEADY AND UNSTEADY FLOW TOWARDS GRAVITY WELLS,
Abadan Inst. of Tech. (Iran).
M. A. Mahdaviani.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 93, No HY6, p 135-146, November, 1967. 10 fig, append.

Descriptors: *Wells, *Groundwater, *Permeability, *Drawdown, Aquifer, Hydraulics, Theis equation.
Identifiers: *Semiconfined flow, Theis formula, Free surface, *Gravity wells, Phreatic surface, Semiconfined aquifer.

Problems of semiconfined flow, such as the flow towards gravity wells, entail the difficult determination of the upper boundary known as the free surface. Rigorous solutions to such problems are usually too complex for practical use. This study seeks to establish a set of curves which relate the height of seepage surface of a gravity well to other geometric and physical characteristics of the surrounding aquifer, and to examine the problem of the lowering or raising of the phreatic surface around a gravity well after the well begins to operate. Results are highly satisfactory, showing that one can measure the permeability of an unconfined aquifer by constructing a well, pumping it out, and measuring the amount of draw-down of the well at two or three different times after the pumping has started. If the permeability of the aquifer is known, one can use the method outlined in this study to foresee the values of the drawdown at various points around the well at different times in semiconfined or unconfined aquifers. (Hunt-NWWA)

DEVELOPMENT IN DEEP SANDSTONE AQUIFER ALONG THE ILLINOIS RIVER IN LA SALLE COUNTY,
Illinois State Water Survey, Urbana.
L. R. Hoover, and R. J. Schicht.
Report of Investigation 59, 1967. 23 p, 25 fig, 10 tab, 18 ref.

Descriptors: Water resources development, Water resources, Water supply, *Water yield, *Aquifers, *Drawdown, Piezometry, Water level fluctuations, Groundwater, Wells, Recharge, *Illinois, Mathematical models, *Hydraulic properties, Water utilization, Sandstones.
Identifiers: *Well yield, Vertical leakage, Piezometric surface.

Large supplies of groundwater are developed from the Cambrian-Ordovician aquifer in La Salle County for municipal and industrial use. Yields of wells normally exceed 500 gpm. Recharge is from vertical leakage through confining beds in the glacial drift or overlying bedrock formations. As a result of heavy pumping the original slope of the piezometric surface has steepened, and water levels have declined more than 100 feet in pumping centers. Hydraulic properties of the aquifer and its confining bed were estimated from available data. Estimates of future nonpumping waterlevel declines in the aquifer were made from a model aquifer and mathematical model. This study provides data for planning and development of groundwater resources for the area. (Staplin-NWWA)

ECONOMIC POLICY FOR WATER RESOURCES AND PLACEMENT FLOWS,
New Mexico Univ., Albuquerque. Dept. of Economics.
M. Gisser.
Natural Resources Journal, Vol 11, No 4, p 714-720, 1971. 3 fig, 6 ref.

Descriptors: *Overdraft, *Irrigation water, *Water allocation (Policy), Water supply, Water demand, Agriculture, Southwest U.S., Pumping, Water rates, Costs, Consumptive use, Water table, Optimization, Natural recharge, State governments, Aquifer management, *Water policy.
Identifiers: *Economic policy, Replacement flows.

'Overdraft' is a continuing problem in the southwestern U.S., creating falling water tables and rising pumping costs. Possible governmental economic policies to cope with the long-run supply and demand water problems are examined for two situations. In the first, with no water imported into the region, the government faces three policies: do nothing, retard the reduction in increased pumping cost and irrigation water prices, or regulate present water consumption. In the case of a minimal return flow the government may also determine the optimal pumping duration before the land is abandoned. The guiding principle in government policy choice is the maximization of the present value of future benefits. In the second case, water is imported into the region. The farmer chooses between local and imported water according to their respective costs. As a result of decreased usage, the water table increases with a consequent price decrease. This process can be expected to cause a continuous fluctuation in both price and the water table over time. Governmental interaction may come into play to stabilize this fluctuation. If the depth of irrigation wells is widely distributed among farms, stability may arise naturally and regulation would not be required. (Schroeder-Wisconsin)

FOREST MANAGEMENT ON THE WATERSHED,
Portsmouth Water Dept., Va.
P. J. Brady, and J. J. Jones.
Journal of the American Water Works Association, Vol 65, No 11, p 701-703, November, 1973. 2 photos.

Descriptors: *Forest management, *Watershed management, *Forest watersheds, Lumbering, Forests, *Virginia, Swamps, 2-4-5-T, Water quality control, Wildlife management, Deciduous trees, Chlorinated hydrocarbon pesticides.
Identifiers: Portsmouth (Va.), Nansemond River (Va.).

The Portsmouth Virginia Water Department manages the forests on its 58-square mile water supply watershed, in an attempt to improve water quality and profitability of the land. The watershed consists of 3,285 acres, including 1,683 acres flooded by four lakes which are impoundments of the Nansemond River. The raw water, referred to as swamp water, has a low pH of 6.0 and a color reading of 300, results of 100 acres of cypress in the water and deciduous trees, mostly oak and gum, in the watershed. Leaves from the trees cause odor, color, stagnation, clogging of screens, algae, aquatic plants, and animal life. Ten years ago, the Water Department began eliminating some deciduous trees by girdling and applying 2-4-5-T, an herbicide. The method of application is described in detail. Pines, cedars, poplars, holly, and dogwood were left standing. Loblolly pines or cedars were planted in the treated area. Although improvement in water quality is difficult to measure, raw water quality is said to be better and easier to treat than 10 years ago. In the past 4 years, lime, alum, and carbon usage for water treatment has been unchanged, but copper sulfate and chlorine use has dropped. Biologists claim that cut and replanted areas increase the population of most game species. The timbering operation produces a modest profit. (Stein - North Carolina)

PLANT SPECIES AS WILDLIFE COVER AND EROSION CONTROL ON 'MUDFLATS' IN IOWA'S LAREG RESERVOIR SYSTEMS,
Iowa State Univ., Ames. Dept. of Botany and Plant Pathology.
J. A. Wilson, and R. Q. Landers.
Available from the National Technical Information Service as PB-226 347 $3.75 in paper copy, $1.45 in microfiche. Iowa State University Water Resources Research Institute Report, ISWRRI-51, July 30, 1973. 10 p, 32 fig. OWRR A-039-IA (3).

Descriptors: *Erosion control, *Mudflats, *Vegetation, *Iowa, Floods, Water level fluctuations, Plant growth, Projects, Plant morphology, Plant physiology, Planting management, Trees, Flood control, Reservoirs, Photography, Data collections, Evaluation.

In recent years, several flood control reservoirs have been built in Iowa, and other are in various stages of planning or construction. This research project was initiated July 1, 1970, to (1) examine the natural establishment of plant species in shallow water and on recently exposed mudflats following the annual release of floodwaters in Iowa's large reservoir systems, and (2) determine suitable species for establishment as wildlife cover and for erosion control. The development of vegetation along a relatively stable shoreline in Iowa contrasts sharply with that in reservoir flood pools. The shoreline of the Lake MacBride subimpoundment of the Coralville Reservoir is well vegetated. This esthetically pleasant area has relatively little soil erosion and provides manageable natural areas for man and wildlife. On the other hand, the impact of extreme fluctuations in the water level of the Coralville flood pool is strikingly visible. Dead standing trees, spectral remnants of the original forest, dominate the upper reaches of the flood pool landscape. Mud and debris characterize the area immediately following the recession of floodwaters. (Woodard-USGS)

05. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification of Pollutants

AN ANALYTICAL METHOD FOR TOTAL HEAVY METAL COMPLEXING AGENTS IN WATER AND ITS APPLICATION TO WATER QUALITY STUDIES,
Missouri Water Resources Research Center, Columbia.
M. J. Smith, D. Jones, S. Harlan, R. Kunkel, and S. E. Manahan.
Available from the National Technical Information Service as PB-226 322 $2.75 in paper copy, $1.45 in microfiche. Completion Report, August 27, 1973. 14 p, 1 fig, 1 tab, 4 ref. OWRR A-056-MO (1). 14-31-0001-3825.

Descriptors: *Heavy metals, *Chelation, Water pollution, Mining, Analytical techniques, Pollutant identification, *Copper, *Ion exchange.
Identifiers: *Atomic absorption analysis, *Chelating agents.

Several methods of analysis were developed for low levels of complexing agents, particularly chelating agents. These species are very important in water quality. It is only very recently that their importance has become very apparent in areas such as heavy metal transport, algal growth, and toxicity of heavy metals. The first method developed was an atomic absorption analysis of strong heavy metal chelating agents. This method is based upon the fact that when copper ion is added to a water sample and the pH adjusted to 10, the only copper that remains in solution is that which is in a complexed or chelated form. In the final few weeks of the project, a new method was developed in which the copper is solublized from a copper-containing chelating ion exchange resin.
W74-02658

THE IDENTIFICATION AND MEASUREMENT OF CHLORINATED HYDROCARBON PESTICIDES ACCUMULATED FROM URBAN RUNOFF,
Tulsa City--County Health Dept., Okla.
J. L. Norton.
Available from the National Technical Information Service as PB-226 307 $3.00 in paper copy, $1.45 in microfiche. Oklahoma Water Resources Research Institute, Stillwater. Final Technical Completion Report, July 1973. 29 p, 2 fig, 9 tab, 10 ref. OWRR B-013-Okla (3).

Descriptors: *Water pollution sources, *Chlorinated hydrocarbon pesticides, *Pollutant identification, *Oklahoma, River basins, Storm runoff, Chemical analysis, Heavy metals, Lead, Chromium, Data collections, Sampling, Water quality, Analytical techniques.
Identifiers: *Arkansas River (Okla), *Tulsa (Okla).

A total of 198 samples of runoff and Arkansas River water were collected in the metropolitan area of Tulsa, Oklahoma, and analyzed for chlorinated hydrocarbon pesticides from March 1970 through June 1972. Sampling at 15 different sites was conducted in three phases: (1) Arkansas River water above and below the metropolitan area, (2) storm drainage basins at maintenance flow, and (3) storm-water runoff. Pesticides identified entering the river from drainage basin outfalls at some time during the project include lindane, heptachlor, heptachlor epoxide, aldrin, and dieldrin. A supplementary investigation of heavy metals in storm-water runoff identified lead and chromium entering the Arkansas River from drainage basin outfalls. (Woodard-USGS)

ELECTRON MICROSCOPIC INVESTIGATION OF NATURAL BACTERIAL POPULATIONS IN THE WATER AND SEDIMENT OF LAKE BALATON AND LAKE BELSO,
Magyar Tudomanyos Akademia, Tihany. Biological Research Inst.
Janos Olah, Lajos Hajdu, and Karoly Elekes.
Ann Inst Biol (Tihany) Hung Acad Sci. 39: 123-129, Illus, 1972.
Identifiers: *Bacterial populations, *Electron microscopy, *Hungary (Lake Balaton-Lake Belso), Lakes, *Lake sediments.

Electron microscopic examination of grids exposed in lake water shows that in Lake Balaton (Hungary) the microbial communities are poor in forms, short rods and ovoid cells are the dominating elements, as opposed to the water of Lake Belso in which the microbial communities are composed of more diverse morphological types. An organism similar to Metallogenium was frequently encountered in the bottom water of Lake Belso. Rod-like forms were dominant in the mud of both lakes during the period of examination. Three very small organisms of unusual shape, consisting of a head and a tail-part were described. On the basis of their morphology, and size they are most probably Mycoplasm-like organisms. In connection with the studies on the structure of microbial communities, the various types of population formation, the signs indicative of intensive growth and decrease of population, the various types of colony formation and the relationship between seston and microorganisms examined.--Copyright 1973, Biological Abstracts, Inc.

FLUORESCENT SPECTROSCOPY, A TECHNIQUE FOR CHARACTERIZING SURFACE FILMS,
Geological Survey, Lakewood, Colo.
M. C. Goldberg, and D. H. Davonald, III.

Journal of Research of the U S Geological Survey, Vol 1, No 6, p 709-717, November-December 1973. 15 fig, 2 tab, 20 ref.

Descriptors: *Remote sensing, *Pollutant identification, *Fluorescence, *Spectroscopy, *Films, Evaporation, Water pollution, Analytical techniques.
Identifiers: Fluorescent spectroscopy.

Fluorescent spectra obtained by using a light path through the liquid solution and the fluorescent spectra obtained by a direct reading of surface reflection were studied for use in remote sensing. A brief review of quantum fundamentals provides the necessary information to conclude that transmitted and reflectance spectra are identical in wavelength response. Many floating films contain fluorescent materials; thus fluorescent spectroscopic techniques may be used to obtain the fluorescent spectra of lube oil, crude oil, and lignosulfonic acid to detect, identify, and quantify these representative fluorescent materials in water solutions. For each material tested the emission maximum was established. The emission maxium was then held constant while the absorption spectrum was recorded and the absorption maximum established. The complete spectral curves are presented. (Knapp-USGS)
W74-02731

INSTRUMENTAL ANALYSIS OF CHEMICAL POLLUTANTS--TRAINING MANUAL.
Environmental Protection Agency, Washington, D.C. Water Quality Office.

Available from NTIS, Springfield, Va 22151, as PB-214 504 Price $3.00 printed copy; $1.45 microfiche. Report, April 1971. 285 p.

Descriptors: *Chemical analysis, *Pollutant identification, *Analytical techniques, Schools (Education), *Training, Environmental control, Scientific personnel, Water analysis, Methodology, *Instrumentation, Water quality, Water pollution sources.
Identifiers: Instrumental analysis, Chemical pollutants, Training manual.

This manual was prepared for reference use of students enrolled in scheduled training courses of the Water Quality Office, Environmental Protection Agency. The course is designed for analytical chemists and others having technical responsibility for the collection, identification and measurement of organic and inorganic pollutants in the aquatic environment. The objectives of the Training Program are to provide specialized training in the field of water pollution control which will lead to rapid application of new research findings through updating of skills of technical and professional personnel, and to train new employees recruited from other professional or technical areas in the special skills required. Chromatographic methodology and optical methods (radiation) of analysis are described. (Woodard-USGS)
W74-02739

DETERMINATION OF FURFURAL IN WATER AND ASPHALT (IN POLISH),
J. Kelus, and K. Wawiernia.
Rocz Panstw Zakl Hig, Vol 23, No 1, p 1-6, 1972, Illus, English summary.
Identifiers: *Asphalt, *Colorimetry, *Furfural, *Spectrophotometry, Iron, Pollutant identification.

Colorimetric and spectrophotometric methods were applied for the determination of furfural levels in water and in the chloroform solutions of asphalt. With available instrumentation a visual colorimetry using aniline solutions in glacial acetic acid proved the most sensitive method of study. In this method Fe was an interfering factor, even in the concentration of 0.1 mg/l. When Fe was present, the furfural determination was done in distillate.--Copyright 1973, Biological Abstracts, Inc.
W74-02798

CHEMICAL QUALITY OF SURFACE AND SEDIMENT PORE WATER IN LOUISIANA AND MISSISSIPPI ESTUARIES,
Louisiana State Univ., New Oreleans.
J. O. Snowden, and E. G. Otvos.
Available from the National Technical Information Service as PB-226 568 $3.50 in paper copy, $1.45 in microfiche. Louisiana State University, Baton Rouge Water Resources Research Institute Completion Report, October 1973. 56 p, 28 fig, 5 tab, 41 ref. OWRR B-009-LA (1).

Descriptors: *Water pollution, *Sediment-water interfaces, Pore water, *Water quality, Water temperature, *Physicochemical properties, Chlorides, Salinity, Organic compounds, Clay minerals, *Hydrogen ion concentration, *Oxidation-reduction potential, Estuaries, Pollutant identification.
Identifiers: Pearl River, Wolf River (Miss), Pascagoula River (Miss), Graveline Bayou (Miss), Ocean Springs (Miss).

The Pearl and Pascagoula Rivers and other smaller streams that empty into Mississippi Sound vary greatly in seasonal water chemistry, as is typical of fresh water dominated estuaries. The water quality in these estuaries is generally good, but the larger rivers, especially the Pearl River, show indications of chemical pollution. The nitrate concentrations in Pearl River, although well below the maximum allowed for municipal water supplies, are higher than the regional average and about the same as for the Mississippi River, which has well-known pollution problems. During times of maximum fresh water runoff, the Pascagoula River also had higher than normal nitrate concentrations. A short stretch of the Escatawpa River, a tributary to the Pascagoula River, showed chronic signs of chemical and organic pollution. The bottom sediments in all the estuaries are active ion exchangers, as shown by variations in the major ion ratios below the sediment-water interface. Ion concentration, ion type, and clay mineralogy influence ion exchange. Recent research has shown that other reactions, especially sulfate reduction, may affect interstitial concentrations of calcium and, perhaps, other metal ions. Because above-normal nitrate concentrations usually indicate other types of pollution, the nitrate sources in the Pearl and Pascagoula Rivers should be identified, and the supply, if possible, be reduced. Future land and industrial development along all these estuaries should be carefully planned to protect the water quality.

RESPIRATION RATES OF SOME NEW ZEALAND ECHINODERMS (NOTE),
Stanford Univ., Pacific Grove, Calif. Hopkins Marine Station.
W. S. Johnson.
New Zealand Journal of Marine and Freshwater Research, Vol 7, Nos. 1-2, p 165-169, June 1973. 1 fig, 2 tab, 9 ref.

Descriptors: *Respiration, *Bioassay, Oxygen, Methodology.
Identifiers: *Echinoderms, Evechinus chloroticus, Goniocidaris umbraculum, Coscinasterias calamaria, Pentagonaster pulchellus, Ion selective electrodes, *New Zealand, Macroinvertebrates, Sea stars.

Respiratory rates were measured in four common New Zealand echinoderms, Evechinus chloroticus and Goniocidaris umbraculum (Echinoidea), and Coscinasterias calamaria and Pentagonaster pulchellus (Asteroidea). The organisms, collected from Otago Harbour and Blueskin Bay, were maintained in running sea water until their guts were cleared. Single animals were placed in air-tight containers filled with air-saturated seawater, and the oxygen tension measured to the nearest 0.01 ppm at hourly intervals with a polarographic oxygen electrode. All experiments were terminated when oxygen tension reached 50 percent saturation. The respiratory rates at 12C ranged from 3.8 to 9.8 microliters 02/h/g (live weight). The rates for Evechinus and Coscinasterias fall well within the range of metabolic rates of other echinoids and asteroids. Goniocidaris and Pentagonaster have relatively low respiratory rates. (Little-Battelle)

DESCRIPTION AND ECOLOGY OF THREE STENONEMA MAYFLY NYMPHS,
National Environmental Research Center, Cincinnati, Ohio. Analytical Quality Control Lab.
P. A. Lewis.
Offprint from: Proceedings of the First International Conference on Ephemeroptera, August 12-20, 1970, Tallahassee, Florida, Florida A and M University, p 57-72. 4 fig, 1 tab, 37 ref.

Descriptors: *Mayflies, *Immature growth stage, *Ecological distribution, Aquatic insects, Systematics, Speciation, Water quality, Sampling, Ecology, Dissolved oxygen, Water temperature, Hydrogen ion concentration, Dissolved solids, Phosphorus, *Ohio River, Natural streams.
Identifiers: *Nymphs, *Insect morphology, Stenonema scitulum, Stenonema terminatum, Stenonema integrum, Animal morphology, *Scioto River (Ohio), Sample preservation.

Three previously underscribed mayfly nymphs (Stenonema scitulum, S. terminatum and S. integrum) were collected from the Ohio and Scioto Rivers and from natural substrates in small streams in the Ohio Basin. The nymphs were reared in tanks to the adult stage and the subimaginal skins, nymphal exuviae and nymphs were preserved in 70 percent ethanol. Complete descriptions are given for the three species of nymphs. (Holoman-Battelle)
W74-02953

CHEMICAL CHARACTERISTICS, BACTERIAL COUNTS, AND POTENTIAL SHELF-LIFE OF SHRIMP FROM VARIOUS LOCATIONS ON THE NORTHWESTERN GULF OF MEXICO,
Texas A and M Univ., College Station. Dept. of Animal Science.
B. F. Cobb, III, C. Vanderzant, C. A. Thompson, Jr., and C. S. Custer.

Journal of Milk and Food Technology, Vol 36, No 9, p 463-468, September 1973. 6 tab, 9 ref.

Descriptors: *Shrimp, *Chemical analysis, *Odor, *Microbial degradation, Nitrogen, Bacteria, Foods, Storage, Hydrogen ion concentration, *Gulf of Mexico.
Identifiers: Biological samples, *Spoilage, Sample preparation, Penaeus setiferus, Penaeus aztecus.

Because of the variation in microbiological characteristics of different waters and consequent spoilage patterns in shrimp, amino nitrogen (AA-N), ammonia, total volatile nitrogen (TVN), trimethylamine nitrogen (TMN), bacterial content, and pH were evaluated as means of measuring spoilage and shelf-life of shrimp. Freshly harvested white shrimp (Penaeus setiferus) from 13 locations on the northwestern coastline of the Gulf of Mexico and brown shrimp (P. aztecus) from 3 water depths near Port Aransas, Texas, and from a commercial fishing boat were placed on steril ice, allowed to spoil, and examined. Samples for chemical analysis were homogenized with trichloroacetic acid and centrifuged. Both TVN and AA-N varied considerably from sample to sample and did not show a consistent pattern of change during iced storage. TMN production was evident in boat-shrimp samples with high TVN levels. Bacterial counts of fresh shrimp did not exceed 10,000/g. Nine of the 10 boat-shrimp samples had counts in excess of 1 million/g. Counts of samples spoiled on sterile ice range from 2 million-10 billion/g. The ratio TVN/AA-N may be useful in conjunction with appearance and odor as a measure of spoilage. Samples with TVN/AA-N greater than 1.3 mg N/millimole were evaluated as poor. Maximum potential shelf-life of boat-shrimp was reduced 0-15 days by handling and storage. (Little-Battelle)

MICRODILUTION ANTIBIOTIC SUSCEPTIBILITY TEST: EXAMINATION OF CERTAIN VARIABLES,
Connecticut Univ. Helth Center, Farmington.
R. C. Tilton, L. Lieberman, and E. H. Gerlach.
Applied Microbiology, Vol 26, No 5, p 658-665, November 1973. 1 fig, 8 tab, 19 ref.

Descriptors: *Resistance, *Antibiotics (Pesticides), E. coli, Methodology, Cultures, Inhibition, Toxicity, Pesticide toxicity.
Identifiers: *Antibiotic dilution tests, Staphylococcus aureus, Pseudomonas aeruginosa, Minimum inhibitory concentrations, Culture media, Ampicillim, Carbenicillin, Cephalothin, Chloramphenicol, Clindamycin, Colistin, Erythromycin, Gentamicin, Kanamycin, Methicillin, Penicillin, Tetracycline.

A semiautomated microdilution susceptibility test is described. The effect of certain parameters such as inoculum size, growth media, incubation conditions, and inoculum dispensing systems was studied with E. coli, Staphylococcus aureus, and Pseudomonas aeruginosa. Both medium type and inoculum size caused significant variations in the minimum inhibitory concentrations (MIC) of certain antibiotic-organism combinations. No effect on MIC was observed as a function of incubator type. Efforts to read a reproducible MIC value in less than 12 h failed. A commercially available wire pronged inoculator was determined to be inaccurate and unsafe. Disposable dropper pipettes proved to be economical, accurate, and precise. Although a standard method for microdilution antibiotic susceptibility testing is not proposed, data are presented which show that future attempts at standardized procedures are mandatory if inter- and intralaboratory reliability is desired. APPLICABILITY OF THE REVERSE-FLOW FILTER TECHNIQUE TO MARINE MICROBIAL STUDIES,
Oregon State Univ., Corvallis. Dept. of Microbiology.
R. P. Griffiths, F. J. Hanus, and R. Y. Morita.
Applied Microbiology, Vol 26, No 5, p 687-691, November 1973. 4 tab, 7 ref.

Descriptors: *Marine bacteria, *Separation techniques, Cultures, Radioactivity techniques, Sea water, Biomass, Absorption.
Identifiers: *Reverse-flow filtration, *Preconcentration, *Method validation, Sample preparation, Recovery, Accuracy, *Vibrio marinus.

The validity of using the reverse-flow filtration technique to quantitatively concentrate marine bacteria was evaluated with both a pure culture of Vibrio marinus and seawater samples. After filtration, the volume of the filtrate and the combined concentrates were measured to determine the concentration factor. Analyses were made on all fractions. Colony forming units (CFU) in the various fractions and in unfiltered samples were determined by the spread-plate technique using Lib-X medium. Total substrate uptake was determined by assaying for C-14 with labeled glutamate, and biomass was determined with C-14-labeled proline. Assay of biomass in the concentrate, filtrate, membrane filter, and filter washings showed that essentially no concentration occurred, and most of the bacteria remained on the filter. Furthermore data indicate that cells were altered during the filtration procedure. Since the number of cells lost on the filter is significant and inconsistent they cannot be represented by a constant. Consequently, results obtained by this procedure should be interpreted with caution. (Little-Battelle)

DECOMPOSITION OF MARINE COPEPODS,
Dalhousie Univ., Halifax (Nova Scotia). Inst. of Oceanography.
G. C. H. Harding.
Limnology and Oceanography, Vol 18, No 4, p 670-673, July 1973. 1 fig, 1 tab, 9 ref.

Descriptors: *Biodegradation, *Sampling, *Copepods, *Sea water, Bacteria, Water temperature, Laboratory tests.
Identifiers: *Calanus finmarchicus.

As the first step in establishing the proportion of net damaged to dead copepods in plankton tows, experiments were conducted to investigate the rate of decomposition of dead animals. Samples of Calanus finmarchicus, which had been killed by suffocation, were sealed in 30-ml vials containing Halifax water at 4 C or Sargasso Sea water at 22 C. Additional tests were conducted in which Calanus were sterilized by gamma radiation or autoclaving. The irradiated calanus were also incubated at 20-22 C in seawater filtered through a 0.22-micron filter. One vial of each series was opened at 24-hour intervals, until decomposition and the carcases stained for bacteria with carbol thionin. The material was stained on a 0.45-micron filter which was later mounted in Permount on a glass slide. Rod-shaped bacteria decomposed dead Calanus within 11 days in 4 C Halifax water and within 3 days in 22 C Sargasso Sea water. In both cases initial infection occurred on the exoskeleton and apparently progressed into the organisms through the mouth. The urosome and internal extremities were the last to be attacked. Samples in filtered seawater were covered with small coccoid bacteria after 49 days, but copepod tissues were all distinguishable. Collection of surface corpses by net is thought to be impossible after the first day of death in subtropical waters and beyond the sixth day in temperate coastal waters. (Little-Battelle)

Identifiers: *Lipolytic bacteria, *Biochemical characteristics, Substrate utilization, *Ottawa

River, Psychrophilic bacteria, Mesophilic bacteria, Biochemical tests, Acinetobacter, Moraxella, Brewery Creek, Aeromonas, Vibrio, Alcaligenes, Chromobacterium, Enterobacteriaceae, Gram-negative bacteria, Gram-positive bacteria, Pseudomonas fluorescens, Pseudomonas putida.

Lipolytic bacteria was isolated from two stations on Brewery Creek, an arm of the Ottawa River, during the winter of 1971-72. Total counts were approximately sevenfold higher at the more polluted downstream station, whereas lipolytic counts were about 100-fold higher. At this station, significantly more lipolytic bacteria grew on plates incubated at 20 C than at 4 C, suggesting that the population was comprised of both mesophiles and psychrophiles. However, at the upstream station, approximately the same number were obtained at both temperatures. A total of 434 isolates, mainly from the downstream station, were tentatively classified. The major groups were Pseudomonas, Acinetobacter-Moraxella, and Aeromonas. Though the total number of lipolytic bacteria was fairly constant throughout the winter, the relative abundance of the acinetobacters dropped from approximately 90 percent in November to less than 10 percent in March, and then increased. The aeromonads and pseudomonads showed the opposite trend. Most of the bacteria, though isolated at 4 C, also grew at 30 C. Lipolysis, however, was generally strongest at 20 C or below. A PORTABLE APPARATUS FOR MEASURING RELATIVE GAS VACUOLATION, THE STRENGTH OF GAS VACUOLES, AND TURGOR PRESSURE IN PLANKTONIC BLUE-GREEN ALGAE AND BACTERIA,
California Univ., Berkeley. Dept. of Botany.
A. E. Walsby.
Limnology and Oceanography, Vol 18, No 4, p 653-658, July 1973. 4 fig, 12 ref.

Descriptors: *Cyanophyta, *Mechanical equipment, *Bacteria, Instrumentation, Cytological studies, Costs, Design.
Identifiers: *Gas vacuolation, Turgor pressure.

An apparatus developed to measure gas vacuolation, strength of gas vacuoles, and cell turgor pressure in blue-green algae and bacteria is based on the finding that a quasi-quantitative estimate of gas vacuoles can be obtained from the decrease in turbidity when gas vacuoles are collapsed by application of pressure. The apparatus comprises three main parts: a cylinder of compressed gas connected to a gas inlet system with a guage to monitor the pressure, which is connected to a pressure-resistant glass nephelometer tube housed in a nephelometer; and a battery-powered millivolt meter with amplifier, monitoring the output of the nephelometer photocell. Readings are made by admitting gas in steps of 50 kN/sq m to a final pressure of 1.4 MN/sq m and recording turbidity at each step. Cell turgor pressure is determined with a second sample containing sucrose solution at a concentration of 0.5 M. The pressure required to collapse the vacuoles is equal to the cell turgor pressure. The relative degree of gas vacuolation can be estimated from the ratio delta T sub a to T sub c, where delta T sub a is the change in turbidity when all vacuoles are collapsed and T sub c is the turbidity due to the cells remaining after collapsing all gas vacuoles. The equipment is portable and costs about 560 dollars for parts. (Little-Battelle)

EVALUATION OF THE FERRIC ION SENSITIVE CHALCOGENIDE GLASS ELECTRODE,
Texas Instruments Inc., Dallas.
R. Jasinski, and I. Trachtenberg.
Journal of the Electrochemical Society, Vol 120, No 9, p 1169-1174, September 1973. 2 fig, 4 tab, 5 ref.

Descriptors: *Iron, *Aqueous solutions, Electrolytes, Monitoring, Industrial wastes, Water analysis, Electrochemistry, *Electrodes.
Identifiers: *Ion selective electrodes, *Detection limits, *Ferric ions, Chalcogenide glass, Sample preparation, Glass electrodes.

Further information is presented on the preparation, composition, performance, and ferric ion sensing mechanism of chalcogenide glass FenSe60Ge28Sb12 (where n falls between 1.3 and 2). Properly prepared and activated electrodes responded to changes in ferric ion concentration in perchlorate, chloride, and nitrate solutions with an average Nernstian slope of 57.6 plus or minus 2.9 mV/decade, over the concentration range of 0.01-00001 M ferric ion based on 16 electrodes). Useful response is found down to at least 0.000001 M Fe (3 plus). Details are presented on the activation and operating procedures. Although a complete evaluation of the sensing mechanism has not been made, it has been established that the activation process involves both an oxidation of the fresh surface as well as a chemical interaction of this surface with ferric iron from solution. The sensing process then involves exchange of ferric iron with this modified surface. (Little-Battelle)

THE MICROBIAL ASSOCIATIONS DEVELOPING ON EXPERIMENTAL TRICKLING FILTERS IRRIGATED WITH DOMESTIC SEWAGE,
Bath Univ. (England). School of Biological Sciences.
N. A. Halls, and R. G. Board.
Journal of Applied Bacteriology, Vol 36, No 3, p 465-474, September 1973. 3 fig, 3 tab, 42 ref.

Descriptors: *Sampling, *Sewage bacteria, *Dominant organisms, *Separation techniques, *Trickling filters, Cultures, Sewage treatment, Systematics, Isolation.
Identifiers: *Acinetobacter, Culture media, Alcaligenes, Bacillus, Pseudomonas putida.

Organisms in trickling filters were sampled by pumping waste from a sewage treatment plant through rotating Perspex tubes with roughened inside surfaces. The biological films were collected by plugging one end of the tubes, adding Ringer's solution and glass beads, plugging the open end of the tube, and shaking to dislodge the film. Disrupted films were cultured for 5 days and tested by Gram staining, by the oxidase test, and for motility, carbohydrate breakdown, and gelatin hydrolysis. The bacterial flora of the film which developed on experimental trickling filters irrigated with domestic sewage was dominated by Acinetobacter and yellow-pigmented Gram negative rod-shaped organisms and it was deduced that purification in certain aerobic waste treatment processes may depend upon an associated of these 2 organisms. Further evaluation of the operational procedures likely to have a selective influence on the microbial association which becomes dominant was made in studies using synthetic sewage. (Little-Battelle)

ESCHERICHIA COLI SEROGROUPS ISOLATED FROM STREAMS IN PENNSYLVANIA, 1965 TO 1972,
Pennsylvania State Univ., University Park. Dept. of Veterinary Science.
P. J. Glantz.
Applied Microbiology, Vol 26, No 5, p 741-743, November 1973. 3 tab, 9 ref.

Descriptors: *E. coli, Natural streams, *Pollutant identification, *Isolation, *Water pollution sources, Pathogenic bacteria, Enteric bacteria, *Pennsylvania, Coliforms, Cultures, Water pollution, Pollutants, Dominant organisms, Running waters.
Identifiers: *Serotypes, Biochemical tests, Fecal coliforms, Culturing techniques, Crawford Lake, Pine Creek, Marsh Creek, Little Pine Creek, Thompson Run, Cedar Run, Slab Cabin Run, Spring Creek, Paradise Creek.

Of 3,200 cultures of Escherichia coli isolated from streams in Pennsylvania over a 7-year period, 82.46 percent or 2,639 were 0 serogrouped. The largest number of cultures (33.4 percent) belonged to 0 groups 1 to 26, and the second highest number (16.8 percent) belongs to 0 groups 60 to 88. The individual E. coli 0 groups most frequently isolated were ADO3, 18ac, 2a, 3, 7, 73, 139, and OX13. Practically every known standard E. coli 0 group was found in the streams. It was not possible to identify the K and H antigen of every E. coli isolate. Serotypes of E. coli 02a:K1:H6, 026:K60:H11, 055:K59:H27, 086:K62:H2, 112ab:K68:H2, 125ab:K70:H21, 128ab:K67:H2, and 0138:K81:H14 known to be pathogenic for humans and animals were identified. Cultures having the same K antigen but a different H antigen for enteropathogenic E. coli 0 groups 6, 18ab, 18ac, 11ab, 126, 127a, 139, 141, and 147 were also isolated. (Holoman-Battelle)

THE OBSERVATION OF MICRO-ORGANISMS ON SURFACES BY INCIDENT FLUORESCENCE MICROSCOPY,
Aberdeen Univ. (Scotland). School of Agriculture.
A. M. Paton, and S. M. Jones.
Journal of Applied Bacteriology, Vol 36, No 3, p 441-443, September 1973. 2 fig, 2 ref.

Descriptors: *Bacteria, *Yeasts, Sampling, Microscopy, Fluorescence, Food processing industry.
Identifiers: *Sample preparation, *Fluorescent microscopy.

Two methods were developed for viewing surfaces for microorganisms by incident fluorescence microscopy. The direct method involves applying optical brighteners and counterstains directly to samples such as meat, fish, skin, plants and minerals and mounting them on glass slides for microscopic observation. The tape method involves placing adhesive tape on surfaces, such as on food processing equipment, removing the tape, and placing it on a glass slide until processing. Tapes can be treated with a fixative to assist retention of organisms, and counterstained. For viewing, the tapes are treated with optical brighteners and mounted, adhesive side up, on glass slides. The procedures have been used in microbiological studies associated with food manufacture, agricultural research, and dermatological investigations. (Little-Battelle)

STATISTICAL ANALYSIS OF BIOLOGICAL DATA FROM PREOPERATIONAL-POSTOPERATIONAL INDUSTRIAL WATER QUALITY MONITORING,
Tennessee Valley Authority, Chattanooga. Div. of Environmental Research and Development.
A. L. Jensen.
Water Research Vol 7, No 9, p 1331-1347, September 1973. 5 fig, 3 tab, 22 ref.

Descriptors: *Monitoring, *Water pollution effects, *Aquatic populations, *Statistical methods, Data processing, Water quality, Industrial wastes, Seasonal, Sampling, Benthic fauna, Invertebrates.
Identifiers: *Control charts, Data interpretation, Displays.

Trends in data on aquatic populations can be assessed using simple statistical methods and plotting results on control charts. The procedure was developed specifically to monitor the effects of industrial water, e.g. from power plants, on water quality based upon preoperational and postoperational data. Since many conditions cause changes in populations, the control charts are constructed with action limits which specify normal deviations of data. A statistical method is given to eliminate seasonal fluctuations in data. When data fall outside the action limits, a disturbance in the system is suspected. Since sampling of bottom fauna on the basis of transects in statistically unsound, a procedure of stratified sampling was developed for calculating statistical values on the basis of subpopulations. Use of the procedure is demonstrated with data from Browns Ferry Nuclear Power Plant which is being constructed by TVA on Wheeler Reservoir in northern Alabama. It is shown that stream monitoring can detect only relatively large changes that occur in aquatic populations. (Little-Battelle)

DETERMINATION OF PHOSPHORUS IN WASTE WATERS FROM THE PULP AND PAPER INDUSTRY,
Institute of Paper Chemistry, Appleton, Wis. Div. of Natural Materials and Systems.
M. A. Buchanan, and D. B. Easty.
Tappi, Vol 56, No 5, p 127-130, May 1973. 1 fig, 4 tab, 4 ref.

Descriptors: Water analysis, *Phosphorus, *Phosphorus compounds, *Phosphates, *Pollutant identification, Analytical techniques, *Pulp wastes, *Lignins, Sulfur compounds, Sulfonates, Chromium, Arsenic compounds, Sulfides, Effluents, Water chemistry, Pulp and paper industry.
Identifiers: Ascorbic acid, Interference (Analytical), Lignosulfonates, Alkali lignins.

The ascorbic acid method for determination of P was modified to adapt it to the analysis of pulp and paper mill effluents. Lignosulfonates in concentrations over 200 mg/liter posed serious interference in total P determinations by producing a typical absorption spectra. Sulfides in amounts above 8 mg/liter reacted immediately with the added combined reagent and thus interfered with the determination of orthophosphates; they were, however, removed by the persulfate digestion and thus did not disturb the total P determination. In the modified procedure devised, Br was added to the samples to remove the sulfide interference and greatly diminish the lignosulfonate interference. Effluents containing alkali lignin produced precipitates that were difficult to filter on neutralization of the persulfate-digested samples. Omission of the neutralization step permitted most of the samples to be filtered readily. Losses of P as aluminum phosphate precipitate were avoided by filtering acidified solutions. In the modified procedure, sulfites up to 1.1 g/liter and sulfates up to 40 g/liter did not interfere. Interferences from hexavalent Cr (1 mg/liter) and As (0.2 mg/liter) were slight, but increased at higher concentrations. (Brown-IPC)
W74-03069

A FLUORIMETRIC DETERMINATION OF LIGNIN SULFONATES FROM NATURAL WATERS IN PRESENCE OF HUMIC SUBSTANCES,
Gotenburg Univ. (Sweden). Dept. of Analytical Chemistry.
T. Almgren, and B. Josefsson.
Svensk Papperstidning, Vol 76, No 1, p 19-23, January 20, 1973. 7 fig, 21 ref.

Descriptors: Water analysis, *Lignins, *Humic acids, *Pollutant identification, *Pulp wastes, *Fluorometry, Analytical techniques, *Spectroscopy, Instrumentation, Rivers, Fjords, Bays, Industrial wastes, Pulp and paper industry, Monitoring, Fluorescence, Water pollution.
Identifiers: Lignosulfonates, Sulfite mills.

Different methods for determining lignosulfonates in the presence of humic compounds are discussed and compared. The UV absorbance of humins generally masks that of lignosulfonates. In analyzing a polluted river water, it was shown, however, that the introduction of lignosulfonates from a sulfite pulp mill effluent can be measured spectofluorimetrically. The sensitivity of the method (0.2 ppm of lignosulfonate) in presence of humins can probably be increased to 20 ppb. The principles of a simple field fluorimeter design are outlined. The suggested method is based on practical measurements of the fluorescence spectra of two different lignosulfonate preparations, Bjorkman lignin, and humic substances in two river waters, as well as fjord or bay waters. Definite differences in peak wavelength and emission intensity per weight per volume were found for the two river waters, while the fluorescence spectra of bay waters were similar and resembled those of humic compounds. (Brown-IPC)
W74-03079

ENHANCEMENT OF SENSITIVITY FOR DETERMINATION OF MERCURY IN WATERS,
Technical Univ. of Budapest (Hungary). Inst. for General and Analytical Chemistry.
E. Harsanyi, L. Polos, and E. Pungor.
Analytica Chimica Acta, Vol 67, No 1, p 229-233, November 1973. 5 fig, 25 ref.

Descriptors: *Mercury, *Water analysis, *Pollu
tant identification, *Analytical techniques, *Trac
elements, Monitoring, Sea water, Spec
trophotometry, Spectroscopy, Toxicity, Chemica
analysis.
Identifiers: Mercury compounds, Methyl mercu
ry, Microanalysis, Atomic absorption spectrosco
py, Concentrating (Enrichment), Tin compounds.

Because of the extreme toxicity of methyl mercu
ry, trace determinations of improved sensitivit
are desirable. Mercury traces are most ap
propriately determined by flameless atomic ab
sorption spectoscopy, but the large sampl
volumes involved recommend the use of a precon
centration step, such as that suggested by Toppin
and Pirie (1972), in which Hg from a 4-liter sea
water sample pretreated with Sn (II) is aerated int
20 ml of a permanganate-sulfuric acid solution
followed by further Sn (II) treatment and aeratio
into the measuring cell. By studying and optimiz
ing the parameters of this method, a rapid sim
plified 16-fold enrichment procedure wa
developed. The modified technique has a detectio
limit of 0.008 ng of Hg/ml, which can be furthe
reduced by decreasing the blank value. Th
transfer efficiency of Hg into the smaller volum
was 93%, and the standard deviation of the en
riching operation was 4% for 7 parallel determina
tions. Several samples can be enriched simultane
ously, independently of the atomic absorptio
measurements, which makes the procedure highl
suited for routine analyses of Hg in waters
(Brown-IPC)

aspects, Water policy, Air pollution contro
Radioactive wastes, Water pollution sources, A
mosphere, Fallout, *Radioactivity.

The observed levels of radioactivity at the Atom
Energy Commission installation in Lemont, I

linois are described. The Argonne National Laboratory is a multidisciplinary research and development laboratory with two principal objectives: to carry out a broad program of basic research activities, and to serve as a center for the design and development of nuclear reactors. The Atomic Energy Commission receives from its contractors semiannual reports on the environmental levels of radioactivity in the vicinity of this and other Commission installations. Releases of radioactive materials from AEC installations are governed by specific radiation standards, and where environmental quality standards have been established, the measured concentration or radiation dose is compared with the standard as a means of assessing the hazard. Charts and graphs include those concerning penetrating radiation, radioactivity in milk, plutonium in soil and grass, radioactivity in surface water, radioactivity in the air, and gamma-ray radioactivity in air-filter samples. STORAGE AND RETRIEVAL OF WATER QUALITY DATA--TRAINING MANUAL.
Environmental Protection Agency, Cincinnati, Ohio. Water Quality Office.

Available from NTIS, Springfield, Va 22151 as PB-214 580. Price $6.00 printed copy; $1.45 microfiche. Environmental Protection Agency Water Quality Office Training Manual, April 1971. 302 p.

Descriptors: *Data storage and retrieval, *Water quality, *Data processing, *Computer programs, Documentation, Data collections, Data transmission, Information retrieval, Training, Schools (Education).
Identifiers: Training manuals.

STORET is the data storage and retrieval system developed by and for the Environmental Protection Agency (EPA) and is a system suitable to the needs of all users of water quality and water resource data. Information and instruction on the STORET system is provided for those persons directly involved in accumulating, processing, and utilizing water data. However, the manual was prepared primarily for reference use of students enrolled in scheduled training courses of the Water Quality Office, Environmental Protection Agency. The seven chapters include: (1) the STORET system; (2) defining station locations; (3) typical problem; (4) station location storage; (5) data storage; (6) changing and deleting station and water quality data; and (7) retrieval. The appendices include: (A) State-County codes, and (B) parameter codes. (Woodard-USGS)

INCIDENCE OF VIBRIO PARAHAEMOLYTICUS IN SHELLFISH FROM EIGHT CANADIAN ATLANTIC SAMPLING AREAS,
Department of National Health and Welfare, Ottawa (Ontario). Health Protection Branch.
W. K. Thomson, and C. L. Thacker.
J Fish Res Board Can, Vol 29, No 1, p 1633-1635, 1972, Illus.
Identifiers: *Atlantic Ocean, Canada, Clams, Human diseases, Incidence, Japan, Mussels, Oysters, Sampling, *Shellfish, *Vibrio-parahaemolyticus.

During July-Oct., 78 cultures of V. parahaemolyticus, closely resembling strains isolated from human cases in Japan, were isolated from clams, mussels, and oysters collected from 8 Canadian Atlantic areas. Approximately 22% of the shellfish examined yielded this species, about half being detectable by direct plating and the rest after enrichment before plating.--Copyright 1973, Biological Abstracts, Inc.

MODELING AND MANAGEMENT OF WATER AND RELATED LAND RESOURCES FOR PHOSPHORUS CONTROL AND ECOLIBRIUM,
Case Western Reserve Univ., Cleveland, Ohio. Dept. of Systems Engineering.
Y. Y. Haimes, P. Das, K. Sung, and K. S. Lee.
Available from the National Technical Information Service as PB-226 419, $6.75 in paper copy, $1.45 in microfiche. Progress report, June 1973. 85 p, 7 fig, 2 tab, 35 ref, 3 append. OWRR B-045-OHIO (1).

Descriptors: *Water quality control, *Mathematical models, *Simulation analysis, *Input-output analysis, *Cost-benefit analysis, Phosphorus, Optimization, Land resources, Legal aspects, Overflow, Waste water treatment, Runoff, Streamflow, Hydrology, Equations, Systems analysis, Lake Erie.
Identifiers: *Ecolibrium.

This progress report summarizes present research results and planned future studies and discusses the total water and land resources system model of the Water Resources Group within the Rockefeller Project for Phosphorus Pollution Control. The scope of this work has been dominated by two major themes (1) distributed pollution sources (carried to the waterbody primarily by runoffs) will play a critical role in the ultimate solution of the water pollution problem; and (2) the level of pollution discharged to a waterbody, attributed both to point and distributed sources, depends on the economic activity of the region as well as on its hydrologic characteristics. Two principal submodels of the total system model are used for modeling the two major themes. First, 'The Modified Stanford Streamflow Simulation Model' predicts the response of the watershed to an input of precipitation on it. Second, 'The Modified Leontief Input-Output Model' predicts the pollutant levels of each sector of the economy in the region as a linear function of the production level of that sector. Economic analysis is performed utilizing various other submodels: capacity expansion 'cost' model; distributed source 'cost' model; ecosystem response 'benefit' model; and a management and coordination (cost-benefit analysis) model. OPTIMAL CONTROL OF NITROGEN LOSSES FROM LAND DISPOSAL AREAS,
Cornell Univ., Itaca, N.Y.
D. A. Haith.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 99, No EE6, Proceedings paper No 10200, 923-937, December 1973. 4 fig, 6 tab, 28 ref.

Descriptors: Water pollution control, Management, *Nitrogen compounds, *Waste disposal, *Sludge, *Linear programming, *Mathematical models, Environmental engineering, Equations, Systems analysis, *New York, Constraints.
Identifiers: *Leaching losses, Soil nitrogen, Disposal schedules.

Concern for environmental quality is forcing a reconsideration of waste disposal alternatives. The land disposal alternative is not free from water pollution potential. Nitrogen losses from percolation and runoff may contaminate water supplies and contribute to the eutrophication of aquatic systems. A general model of the soil nitrogen budget was developed for the purpose of comparing alternative strategies for controlling nitrogen leaching losses from a cropped land disposal area. The model is based on monthly inventory equations for both inorganic and organic soil nitrogen uptake, mineralization of organic nitrogen, and leaching. The model was tested using nitrogen budget data from several New York corn production field studies. The model was linearized and linear programming was used to find monthly disposal schedules that maximize annual returns from a sewage sludge disposal system subject to constraints on nitrogen leaching losses. (Bell-Cornell)

MULTIGOAL WATER QUALITY PLANNING MODEL,
Krannert Graduate School of Industrial Administration, Lafayette, Ind.
D. E. Pingry, and A. B. Whinston.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 99, No EE6, Proceedings paper No 10208, p 909-922, December 1973. 1 fig, 15 ref.

Descriptors: Environmental engineering, Water pollution control, *Alternative planning, *Comprehensive planning, *River basins, Economics, Temperature, *Dissolved oxygen, Regional analysis, Treatment facilities, Methodology, Systems analysis, Mathematical models.
Identifiers: *Multiobjective planning, *Nonlinear programming, Streeter-Phelps model, *Cost minimization.

In view of the large variation in stream assimilative capacity, uniform pollution control rules introduce significant inefficiencies. A methodology is presented which takes advantage of these variances and treats water pollution as a regional, basin-wide problem. A simulation model of river basin water quality serves as the constraint set for an optimization model that searches for the least-cost solutions given the quality goals. Specifically, the traditional Streeter-Phelps dissolved oxygen model is integrated with a heat decay model. The resulting quality model is incorporated into a nonlinear programming river basin model that solves for the minimum cost combination of treatment strategies to meet predetermined quality goals. This modeling technique is unique in two respects: (1) the interaction of temperature and dissolved oxygen levels is explicitly modeled; and (2) five alternative treatment strategies are examined. The behavior of both thermal and oxygen demanding wastes in a river is always modeled independently, even though it is well known that the level of the temperature affects the rates of oxidation reactions and the saturation level of oxygen; herein however these relations are explicitly assumed. The treatment strategies examined simultaneously are on-site treatment, regional treatment, by-pass piping, flow augmentation, and cooling towers. (Bell-Cornell)

A WATER QUALITY SIMULATION MODEL,
Meta Systems, Inc., Cambridge, Mass.
E. McBean, O. T. Sigvaldason, R. deLucia, M. Fiering, and I. K. Hill.
In: Proceedings of the Summer Computer Simulation Conference, Montreal, P.Q., Canada, July 17-19, 1973. 11 p, 7 fig, 2 tab, 5 equ, 25 ref.

Descriptors: *Water quality, *Management, *Planning, *Simulation analysis, Hydrology, *Stochastic processes, Evaluation, Environmental control, Environmental effects, Watersheds (Basins), Dissolved oxygen, Water quantity, Mathematical models, Systems analysis, *Canada.
Identifiers: Methodological study, *Saint John River (Canada), Environmental quality, Ecological damage.

A generalized water quality simulation model developed as part of a methodological study of water quality management planning (to be used therein in conjunction with a prescriptive, screening model) is described. The model allows considerable latitude of application and is particularly useful for problems of large basins and long periods of potentially critical quality conditions. The model demonstrates significant contributions in the tandum use of mathematical models to understand stressed regions where intensity, frequency, and duration of water quality stress are important measures of ecological damage. Also, the model provides insight into conditions where the quality levels are unstable (in time or space)--which implies potential shifts in multiple critical reaches. To avoid excessive computer storage requirements, the model has been divided into five segments: (1) synthetic seasonal flow generator; (2) daily hydrology inflow generator; (3) flow routing segment; (4) quality routing segment; and (5) output segment. A case study application to the Saint John River is describe. (Bell-Cornell)

THE ADSORPTION OF RHODAMINE-B ON TO MATERIALS CARRIED IN SUSPENSION BY INSHORE WATERS,
Ministry of Agriculture, Fisheries and Food, Lowestoft (England). Fisheries Lab.
J. W. Talbot, and J. L. Henry.
Journal du Conseil, Vol 32, No 1, p 7-16, July 1968. 4 fig, 1 tab, 4 ref.

Descriptors: Coasts, *Estuaries, *Rhodamine, *Dye concentrations, *Path of pollutants, Circulation, *Adsorption, *Suspended load.

Experiments have been carried out to investigate the adsorption of Rhodamine-B on to suspended material when the dye is used in the turbid waters of some English east coast estuaries. This adsorption appears to be most serious when large dilution has taken place. The experimental results lead to an equation between observed dye concentrations and that to be expected under otherwise similar conditions but without loss of dye from solution by adsorption. It appears that significantly improved results are obtained when adsorption is taken into account, although it is clear that the assumption of a constant value of the suspended load must be an approximation which will limit the accuracy attainable. PROBLEMS OF UNDERGROUND STORAGE OF WASTES,
Geological Survey, Raleigh, N.C.
R. L. Nace.
Journal of Research of the U S Geological Survey, Vol 1, No 6, p 719-723, November-December 1973. 8 ref.

Descriptors: *Underground waste disposal, *Waste disposal wells, *Water pollution sources, Water pollution effects, Path of pollutants, Groundwater, *Waste storage, *Underground storage.

Problems of underground storage of waste involve geology in its broadest sense, including hydrology, geochemistry, and geophysics. Wastes may be solid, liquid, or gaseous, and they may be chemically toxic or noxious, esthetically offensive, or radioactive. Some wastes require only temporary containment, whereas others must be isolated for indefinitely long periods. The means and locale for emplacement underground depend upon many governing geological factors, including the physical, chemical, hydrological, and hydraulic properties of the host formation. These must be studied relative to the physical, chemical, and thermal properties of the waste and of potential interactions between the waste and the host formation. Thorough knowledge is essential because lack of it may lead to undesirable or disastrous environmental consequences. Escape of waste may contaminate the surface or near-surface environment; it may destroy the usefulness or accessibility of resources such as groundwater, petroleum, and minerals. Effective management of underground waste requires adaptation of current technology and development of new technology. (Knapp-USGS)

EFFECTS OF MIGRATORY WATERFOWL ON WATER QUALITY AT THE MONTEZUMA NATIONAL WILDLIFE REFUGE, SENECA COUNTY, NEW YORK,
Geological Survey, Albany, N.Y.
M. R. Have.
Journal of Research of the U S Geological Survey, Vol 1, No 6, p 725-734, November-December 1973. 2 fig, 5 tab, 15 ref.

Descriptors: *Water quality, *Wildlife management, *Waterfowl, *Shellfish, Commercial fishing, Water pollution sources, Path of pollutants, Bacteria, Nutrients, Pathogenic bacteria, Aquatic bacteria, *New York.

To find whether bacteria in effluent from the national wildlife refuges along the northeast coast of the United States may be adversely affecting the harvest of shellfish, water quality was studied in the Montezuma Refuge, N. Y. A line graph shows inconsistent relationships between bird population at the Montezuma refuge and total coliform, fecal coliform, and fecal Streptococci counts. Salmonella were found in only one of 17 samples of water taken within the refuge. Counts of nonpathogenic bacteria in the two major streams flowing into the refuge, Black Brook and White Brook, were greater than they were in water flowing out of the refuge. Specific conductance of water flowing out of the refuge was less than that of water flowing into the refuge, although the effluent had higher concentrations of phosphorus and nitrogen than the influent. A settling-pond effect in the quiet water of the refuge may help explain the improvement in the quality of the water leaving the refuge. (Knapp-USGS)

DISPOSAL OF BRINE INTO AN ESTUARY,
Camp, Dresser and McKee, Inc., Pasadena, Calif.
A. B. Pincince, and E. J. List.
Journal Water Pollution Control Federation, Vol 45, No 11, p 2335-2344, November 1973. 9 fig, 2 tab, 8 ref.

Descriptors: *Brines, *Jets, *Path of pollutants, *Estuaries, Mixing, Dispersion, Density, Density currents, Turbulence, Model studies, Hydraulic models.

Because of their toxicity, brines must often be diluted when discharged to fresh of saline water using multiple-port diffusers. These negatively buoyant jets behave quite differently from wastewater jets, which are lighter than the seawater to which they are often discharged. A theoretical and laboratory study was made of brine dilution after discharge from an outfall into a flowing stream. Initial analysis was based on studies conducted on disposal of brine into still water; a laboratory study was conducted to obtain concentration profiles for various current velocities and angles of the discharge port. Comparison of experimental results with a jet theory relying on entrainment and drag shows that the theory predicts much lower dilutions. The apparent reason for the inadequacy of the theory is that it ignores ambient turbulence. (Knapp-USGS)

A GALERKIN-FINITE ELEMENT SIMULATION OF GROUNDWATER CONTAMINATION OF LONG ISLAND, NEW YORK,
Princeton Univ., N.J. Dept. of Civil and Geological Engineering.
G. F. Pinder.
Water Resources Research, Vol 9, No 6, p 1657-1669, December 1973. 7 fig, 18 ref.

Descriptors: *Path of pollutants, *Groundwater movement, Malenclaves, Finite element analysis, Transmissivity, Mass transfer.
Identifiers: Galerkin method, Long Island (NY).

The Galerkin method of approximation in conjunction with the finite element method of analysis may be used to simulate the movement of groundwater contaminants. In solving the groundwater flow and mass transport equations this approach allows a functional representation of the dispersion tensor, transmissivity tensor, and fluid velocity, as well as an accurate representation of boundaries of irregular geometry. A field application of the method to chromium contamination on Long Island, New York, shows that accurate simulations can be obtained by using the Galerkin-finite element approach. (Knapp-USGS)

ANALYSIS, MODELING AND FORECASTING OF STOCHASTIC WATER QUALITY SYSTEMS, VOLUME I, TIME SERIES ANALYSIS IN WATER QUALITY MODELING,
Kansas Water Resources Research Inst., Manhattan.
E. S. Lee.
Available from the National Technical Information Service as PB-226 566 $6.50 in paper copy, $1.45 in microfiche. Completion Report, Contribution No. 110, July 1972. 272 p, 43 ref. OWRR A-048-KAN (1).

Descriptors: *Water quality, System analysis, *Forecasting, *Model studies, *Time series analysis, Mathematical models, Simulation analysis, Groundwater, Water resources management, Hydrologic models, Pollution, Water temperature, Potomac River, Regression analysis, Activated sludge, Path of pollutants.
Identifiers: *Nonlinear filtering, Spectral analysis, Ontario River.

Optimal and nonlinear filtering, and time series analysis and estimation are used for the modeling and forecasting of water quality systems. The principal advantage of the time series approach is that useful quantitative information can be abstracted from the original rough data which are collected over a long period of time. Furthermore, by the analysis of these rough data, useful mathematical representations of the various pollution parameters can be obtained. Actual data obtained from Potomac River and Ontario River are used to illustrate the technique. The principal advantage of the nonlinear filtering approach is the sequential nature of the estimation scheme. Various linear and nonlinear estimation schemes such as Kalman filters, minimum variance estimator, maximum likelihood (Bayessian) estimator, maximum a posteriori estimator, and the dynamic programming estimator are investigated and compared. To increase the convergence rate, optimization and purterbation are incorporated into the various nonlinear estimation schemes. The computational results indicate that both the time series analysis and nonlinear filtering are useful techniques for the modeling and forecasting of water quality systems. (See also W74-02824)

ANALYSIS, MODELING AND FORECASTING OF STOCHASTIC WATER QUALITY SYSTEMS, VOLUME II, NONLINEAR FILTRATION AND ESTIMATION IN WATER QUALITY MODELING,
Kansas Water Resources Research Inst., Manhattan.
E. S. Lee.
Available from the National Technical Information Service as PB-226 567 $5.75 in paper copy, $1.45 in microfiche. Completion Report, Contribution No. 110, July 1972. 224 p, 286 ref. OWRR A-048-KAN (1).

Descriptors: *Water quality, System analysis, *Forecasting, *Model studies, *Time series analysis Mathematical models, Simulation analysis, Groundwater, Water resources management, Hydrologic models, Pollution, Water temperature, Potomac River, Regression analysis, Activated sludge, Path of pollutants.
Identifiers: *Nonlinear filtering, Spectral analysis, Ontario River.

Optimal filtering and estimation is used for water quality modeling and prediction; nonlinear estimation and filtering techniques are emphasized. According the degree of approximations, there are first-order and second-order nonlinear filters. These various filters are applied to a typical water quality problem. The advantage of the filtering approach is that a sequential estimation scheme is obtained. Only current data are needed to estimate the current or future values of the parameters. Not only the parameters but also the future concentrations of the pollutants can be estimated by this approach. Thus, it forms an effective forecasting technique which used the weighted average of the past and current experimental data. One of the problems in applying the invarient imbedding and nonlinear filtering schemes is that the convergence rate depends on the initial value used of the adjoint or weighting function equations. Two approaches are developed to obtain the optimal or best initial values of the weighting function: optimization approach and purterbation. The latter approach appears to be more effective. The effect of the initial conditions of the weighting function on the convergence rate of BOD is also discussed. (See also W74-02823)

Descriptors: *Nuclear power plants, *Heated water, Rivers, *Connecticut River, Electric power production, *Thermal pollution, Cooling water, Effluents, Aquatic environments, Environmental effects, Aquatic animals, Benthos, On-site-data collections, Evaluation, Migration, Growth, Mortality, Salinity, Temperature, Shad.

In 1966 an atomic power plant went into operation in the Haddam Neck region of the Connecticut River. A long-term study of the environmental impact of the facility which began in 1965 is discussed. The Haddam Neck region is about 15.5 miles from the mouth of the river. In this area the river is tidal in character, rising and falling 2.5 feet and having a salinity of from 25 to 31 parts per thousand. The average daily natural flow of the river is about 16,000 cu ft/s. The condenser cooling effluent is returned to the river in a flow of 828 cu ft/sec. with a temperature increase of 22.4 degrees F. The resulting heated plume streams upriver on the flood-tide as far as two miles and extends completely across the river during ebb. Benthic fauna in the intake and discharge areas were affected by turbulence and temperature changes. Catfish and bullhead fish species were observed to collect in large numbers in the discharge canal of the power plant during the winter months. Major fish kills have been recorded on three occasions since the plant went into operation. In a specific study of shad, no alterations of population size, migration rates or age and spawning history attributable to thermal effluents have been observed. (Jerome-Vanderbilt)

CHARACTERISTICS OF STEAM ELECTRIC CONDENSER COOLING WATERS,
Johns Hopkins Univ., Baltimore, Md.
W. L. Graves, Jr., and J. E. Edinger.
In: Proceedings of the Industrial Waste Conference, University of Delaware, Newark, Nov 13-15, 1967. p 255-274 (1967), 11 fig.

Descriptors: *Heated water, *Effluents, *Temperature, Distribution, On-site data, *Estuarine, Electric power production, Thermal power plants, Discharge (Water), Collections, Analytical techniques, Models, Forecasting, *Tidal waters, Meteorology, Design, Water temperature, Frequency analysis, Time series analysis, *Thermal pollution.

A survey program to obtain data to test the temperature distributions of receiving waters under varying meteorological conditions, for the purpose of predicting water temperatures near thermal discharges is discussed. The rate of heat exchange at the water surface and the factors important to the heat budget are considered. The field study program was divided into four groups: meteorological; plant information; hydrographic observations; and observations using portable equipment to check recording instruments. Meteorological measurements included air temperature, relative humidity, wind speed, wind direction, solar radiation and precipitation. Plant information included total plant load, total heat rejected, condensing cooling water intake and discharge temperatures, and the pumping rate of cooling water. A 150 megawatt power plant site located only 6 miles from the Atlantic Ocean was chosen as an example. Time series data are analysed by means of time domain to frequency domain transformations. The results are presented in the form of periodogram estimates of the spectra. (Jerome - Vanderbilt)

MHD CENTRAL POWER: A STATUS REPORT,
Tennessee Univ., Space Inst., Tullahoma.
J. B. Dicks.
Mechanical Engineering, Vol 94, No 5, p 14-20, May 1972, 8 fig, 2 tab, 18 ref.

Descriptors: *Electric power production, *Thermal powerplants, Nuclear energy, Fossil fuels, Chemical reactions, Thermal pollution, Cost analysis, Breeder reactors, Electric power demand, Design, Research and Development.
Identifiers: *Magnetohydrodynamics, *Thermal efficiency, MHD power plants, Energy crisis.

Magneto-hydrodynamic power (MHD) is generated when an easily ionized metal, such as potassium or cesium, is introduced into a high-temperature combustion gas, which is expanded and directed into a magnetic field. A moving conductor cuts magnetic field lines and a useful emf is generated. This process may soon become an important source of electric power. Until recently the problems associated with high temperatures have prevented application of this technique to combustion gas plasmas. Within approximately ten years it should be possible to construct practical MHD power plants in the 2000-MW range with thermal efficiencies of up to 50 to 60%. The cost of MHD power is compared with existing and proposed electric power sources. Present research and development efforts in the U.S. and other nations are considered. Although there is research continuing at Stanford University and the University of Tennessee, no central-power MHD programs have as yet begun. The higher efficiency and resultant economy would recommended increased research and development of technology in this area in the United States, as this country is falling further behind such countries as Japan and the Soviet Union, where full scale experiments are already being conducted. POWER PLANT EFFLUENT - THERMAL POLLUTION OR ENERGY AT A BARGAIN PRICE,
Westinghouse Research Lab., Pittsburgh, Pa.
W. S. Lusby, and E. V. Somers.
Mechanical Engineering, Vol 94, No 6, p 12-15, June, 1972, 4 fig, 1 tab, 6 ref.

Descriptors: *Electric power production, *Thermal pollution, *Heating, *Air conditioning, Thermal power plants, Design, Cooling, Cost analysis, Economics, Fossil fuels, Seasonal, Geothermal studies, Model studies.
Identifiers: *Model towns, Reykjavik, Lithium-Bromide refrigeration.

It is possible that waste heat from electric power plants may become an economical source of energy. One proposal for using this heat effectively in both winter and summer seasons is the development of integrated heating and cooling systems for 'new towns'. A heating system using geothermal winter services about 81,000 people in Reykjavik at a cost which is only 60% of that for fossil fuels. A heat driven lithium-bromide refrigeration system could supply chilled water for cooling interior space. Since there is a good match between the peak power demand for home heating in winter and home cooling in the summer, an integrated system using the waste thermal energy from electricity generation as a power source is possible. An integrated design for a new community using such a system is outlined. A cost analysis of combined electrical and heating/cooling systems is presented. (Jerome-Vanderbilt)

SOME ASPECTS OF CHEMICAL CONTROL OF SOIL-BORNE PATHOGENS,
Plantenziektenkunde Dienst, Wageningen (Netherlands).
A. F. H. Besemer.
Bull Oepp (Organ Eur Mediterr Prot Plant). 7. p 31-40. 1972.
Identifiers: *Bacteria, *Chemical control, Chloropicrin, Metabolites, *Pathogens (Soil-borne), Propene, Nitrification, Soil fumigants.

The effect of a soil fumigant on soil-borne pests and pathogens depends largely on a sufficient distirbution through the top soil and the availability of the fumigant or the biologically active degradation products in the water phase. Nearly all the fumigants are dispersed in the soil mainly in the vapor phase and therefore the amount of air between the soil particles is very important. Consequently on light soils it is relatively easy to obtain an efficient control, but on heavy or wet soils and on soil types with a high humus content it is rather difficult to get reliable results. The concentration of the fumigant in the upper few centimeters of the soil is often insufficient to get good control after injection of the material at 15-20 cm depth. The effect may be improved by using a plastic cover or a 'split plot' application. The elimination of most of the fumigant is necessary to avoid a phytotoxic effect on wet soils and on soil types with a high organic content. Factors influencing the decrease of the fumigant residue in the soil are discussed. The soil fumigant application gives rise to important changes in the whole ecosystem in the soil. Information on the influence on non-target organisms is scarce. The application of dichloropropene and of chloropicrin may lead to a noticeable effect on the nitrificating bacteria. The soil application of fumigants may give rise to residues in plants of the parent chemical or, to a larger extent, to residues of metabolites. The fate of the metabolites arising from dichloropropene and related compounds has not been fully clarified.--Copyright 1973, Biological Abstracts, Inc.

ENVIRONMENTAL CHALLENGES AND NUCLEAR FUELS,
Bechtel Power Corp., San Francisco, Calif.
W. K. Davis.
Chemical Engineering Progress, Vol 69, No 6, p 48-53, June 1973. 2 fig.

Descriptors: *Nuclear power plants, *Thermal pollution, *Fuels, *Forecasting, Research, Electric power production, Environment, Fossil fuels, Radioactivity, Design criteria, Safety factors, Radioactive wastes, Nuclear reactors, Breeder reactors, Uranium, Development, Economics, Efficiencies, Radioisotopes.

The increasing demand for energy makes it likely that nuclear power plants will remain a major source of electricity. A discussion of the environmental and technological problems associated with nuclear energy is separated into short-range, mid-term, and long range situations. The short-term period is considered to be the next 8 to 10 years and the associated problems are mainly of a social and political nature. The mid-term covers from the early 1980's until the year 2000, and the major problems for consideration are selection of priorities and areas of new developments. The long-term period extends beyond 2000 during which new inventions and their application must be considered. Nuclear energy is expected to fill 16% of the national energy requirement in 1985. Heat rejection is the largest problem associated with reactor operation. The use of breeder reactors could provide a greatly increased supply of nuclear fuel. Improved reactor design and cooling technology should reduce thermal pollution to some extent but it seems clear that compromises must be made somewhere. Radio-activity leaks from power plants are not considered a serious problem, and radio-active wastes are very small in quantity. Nuclear energy still provides the most hopeful source of fuel to fill long range energy requirements. (Jerome-Vanderbilt)

EFFECTS OF THERMAL ADDITIONS FROM THE YELLOWSTONE GEYSER BASINS ON THE BACTERIOLOGY OF THE FIREHOLE RIVER,
Indiana Univ., Indianapolis. Dept. of Microbiology.
J. G. Zeikus, and T. D. Brock.
Ecology, Vol 53, No 2. p 283-290 Early Spring 1972. 5 fig, 2 tab, 12 ref.

Descriptors: *Thermal springs, *Temperature, *Geothermal studies, *Thermal pollution, Bioassays, Rivers, Heated water, Benthos, Bacteria, Aquatic habitats, Thermophilic bacteria, Geysers.
Identifiers: *Firehole River, Yellowstone Geyser Basins, Bacteriology.

A series of stations was established on the Firehole River where it flows through the main geyser of Yellowstone Park, and temperature, pH, alkalinity, conductivity, and phosphate were measured. The temperature of the water gradually increased as it flowed through the thermal area, at its warmest averaging about 16C higher than in the cool area (10 to 26C). Thermophilik organisms were not present in water which had not received thermal additions, but both kinds of thermophiles were found in the warm water, and numbers increased progressively as more thermal water entered. In the recovery zone downstream from the thermally heated region, the number of thermophilic bacteria decreased markedly. The possible value of these thermophilic bacteria as indicators of thermal pollution is discussed. It is suggested that the Firehole River is an excellent model for long-term studies on the ecological consequences of thermal pollution. (Jerome-Vanderbilt)

L. C. Neale.
Journal of the Power Division, American Society of Civil Engineers, Vol 97, No P04, p 827-838, December, 1971. 12 fig.

Descriptors: *Model studies, *Thermal pollution, *Chesapeake Bay, Temperature, *Thermal powerplants, Distribution patterns, Powerplants, Fish, Water pollution, Water quality, Jets.
Identifiers: *Jet entrainment.

The model studies of a 34-mile section of Chesapeake Bay have developed the flow patterns of the warm water effluent from the Calvert Cliffs Nuclear Power Station. These flow patterns, shown as plots of the plan view model area and cross sections at several points, describe in three dimensions the magnitude and location of excess temperature. It was demonstrated that the release of the warm water as a 10F jet well off shore (850 ft) induced entrainment of available receiving water so that maximum temperatures at the water surface outside a small local area reached only 4F. The shape and sweep of the warm water plume allowed a large percentage of the cross section of the bay to operate as a clear passage (no temperature) for fish. (Oleszkiewicz-Vanderbilt)

Identifiers: *Bottom sediments, Corbicula-Sendai, *Heavy metals, *Japan (Lake Biwa), Lakes, Pollution, Rivers, Water quality, Mercury, Cadmium, Lead, Nitrogen, Calcium.

The transparency of the water of the northern part of Lake Biwa, Japan has fallen to 3/5 and the total N (>0.2 ppm) has risen, which means that the upper water of the northern part of the lake is heavily polluted. The heavy metal (Hg, Cd and Pb) content of the bottom matters of Lake Biwa indicates that the bottoms of Hama-otsu and Nionohama are polluted by heavy metals. The accumulation of Ca in the freshwater bivalve, Corbicula sandai, increases 1 ppm/year with the age of the shellfish.--Copyright 1973, Biological Abstracts, Inc.

THE MOVEMENT AND IMPACT OF PESTICIDES USED FOR VECTOR CONTROL ON

THE AQUATIC ENVIRONMENT IN THE NORTHEASTERN UNITED STATES,
Little (Arthur D.), Inc., Cambridge, Mass.
C. D. Reese, and D. L. Becker.
Copy available from GPO Sup Doc, $1.75; microfiche from NTIS as PB-217 843, $1.45. Report No. EPA-OWP-TS-00-72-09, July 1972. 202 p, 15 tab, 263 ref. Contract No. DI-68-01-0129.

Descriptors: *Pesticide toxicity, *Pesticide residues, Legislation, *Biodegradation, *Reviews, Water pollution effects, Path of pollutants, Public health, Animal metabolism, Pest control, DDT, Dieldrin, Fish, Invertebrates, Worms, Shellfish, *Northeast U.S.
Identifiers: *Fate of pollutants, *Cape Cod, Biotransformation, Malathion, Methoxychlor, Abate, Naled, Carbaryl, Carbofuran, Fenthion, Fuel oil, Pyrethrum, Paris green, Persistence, Macroinvertebrates.

Because of the importance of Cape Cod as a fishing and recreational area and its long history of mosquito abatement programs, a case study was conducted to investigate the kinds and quantities of vectoricides used, methods of application, routes into water, degradation and metabolism, effects on ecosystems, and laws and regulations affecting their use. The Bass Hole Marsh in Dennis and the Herring River Marsh in Harwich were selected for intensive study to compare the effects of treatment programs on the north and south shores of Cape Cod. A literature search was conducted, interviews were held, and field work was undertaken in the two marshes to observe the effects of vectoricides on the aquatic environment and to determine the levels of vectoricide residues in soil and water samples. LAKE MICHIGAN DISCHARGE STUDIES.
Illinois Inst. for Environmental Quality, Chicago.

Available from National Technical Information Service as PB-221 869, $9.50 in paper copy, $1.45 in microfiche. Final Report, June 1973. 146 p, 6 fig, 30 tab, append.

Descriptors: *Industrial wastes, Electric power industry, Food processing industry, *Domestic wastes, *Electric powerplant, *Chemical wastes, Boiler feed water, Biochemical oxygen demand, Cooling water, Waste water (Pollution), Dissolved solids, Thermal pollution, Recycling, Hydrogen ion concentration, Alkalinity, Hardness (Water), Phosphorus, Ammonia, Sodium, Calcium, Magnesium, Sulfates, Chlorides, Iron, Copper.
Identifiers: *Pharamaceutical plants, Flour mills, Cereal plants, *Steel millsm *Piping companies, *Smelters, Characterization, Outboard motors, Fermentation beers, Process wastes, Organic carbon, Blowdown, Slag tanks, Demineralizers, Filter backwash, Grain elevators, Settleable solids, Organic nitrogen, Plating wastes, Pickle liquors, Ballast water, Hexane solubles.

To investigate the feasibility of zero discharge of industrial wastes into Lake Michigan, effluents from eight of the 16 major dischargers were surveyed. The companies surveyed were a pharmaceutical manufacturer, a coal-powered generating station, a flour mill and cereal plant, an outboard motor manufacturer, a smelter, two steel plants, and an oil piping company. The surveys included characterization of effluents, analysis of treatment facilities and procedures, feasibility of waste recycling, and some recommendations for improvement of treatment procedures. In terms of volume, the largest discharges to the lake were cooling waters. (Little-Battelle)

SOME ASPECTS OF THE BIOLOGY OF CALLIOPIUS LAEVIUSCULUS (KROYER) (CRUSTACEA, AMPHIPODA) IN THE NORTHWESTERN ATLANTIC,
Memorial Univ. of Newfoundland, St. John's. Dept. of Biology.
D. H. Steele, and V. J. Steele.
Canadian Journal of Zoology, Vol 51, No 7, p 723-728, July 1973. 5 fig, 2 tab, 9 ref.

Descriptors: *Sexual maturity, *Life cycles, *Aquatic habitats, *Crustaceans, *Atlantic Ocean, Population, Distribution patterns, Size, Fecundity, Water temperature, Zoolplankton, Seasonal.
Identifiers: *Calliopius laeviusculus, Macroinvertebrates.

Calliopius laeviusculus, a small amphiopod, was collected from several locations in the northwestern Atlantic, primarily in eastern Newfoundland, to study their biology. The organisms were not most commonly found attached to algae on rocky shores with moderate wave exposure. Populations peaked in late summer when the animals swarm at the surface and may than be found in the plankton far out to sea or on protected shores. They appear to be confined to areas with positive mean monthly summer temperatures not exceeding about 22C. Fifty percent of the females were calculated to be mature at 5.6 and 6.7 mm in the summer and winter respectively in Newfoundland waters, but, in Labrador, maturity was not achieved in females up to 10 mm in length. In Newfoundland several generations are produced per year and the females may have more than one brood. However, the females are in the resting stage between August and November-December, and young are only released from spring until late summer. In Labrador, where only one generation is produced per year, young are released in the spring but probably do not reach maturity until the autumn. In Newfoundland fecundity does not vary seasonally. (Little-Battelle)

NATURAL HABITAT OF CARYOPHANON LATUM,
Mount Allison Univ., Sackville (New Brunswick). Dept. of Biology.
W. C. Trentini, and C. Machen.
Canadian Journal of Microbiology, Vol 19, No 6, p 689-694, June 1973. 1 fig, 3 tab, 7 ref.

Descriptors: *Farm wastes, *Water pollution sources, *Pollutant identification, *Isolation, *Habitats, Domestic animals, Bacteria, Cattle, Cultures, Methodology, Sampling, Sheep, Hogs, Hay, Grains (Crops), Pastures, Soils, Aerobic bacteria.
Identifiers: *Caryophanon latum, Schizomycetes, Environmental samples, Enrichment, Pure cultures, Mixed cultures, Fecal bacteria, Feces, Horses, Salvia, Rumen fluid.

When samples of fresh dung from pigs, horses, sheep, or cattle were enriched to encourage the growth of Caryophanon latum, the organism was found to be specifically associated with cattle dung. Several sheep dung samples were found to be positive for C. latum, but all were taken from a pasture where sheep and cattle were grazed together. All samples taken from sheep not pastured with cattle were negative. Autoclaved samples of cattle, horse, and sheep dung all supported growth and natural morphology of C. latum after 1-4 days exposure. Control samples exposed to air in areas far removed from cattle were uniformly negative. Aseptically collected 'free catch' samples from cattle were mainly negative, as were samples collected from the fistulated rumen. Enrichment of various other sources was undertaken. Total findings support the hypothesis that C. latum is a natural, specific, and temporary resident of cattle dung and is dispersed to new droppings by contaminated air and also probably by flying insects or cattle movement. (Holoman-Battelle)

OBSERVATIONS ON UPSTREAM MIGRATION BY IMAGINES OF SOME PLECOPTERA AND EPHEMEROPTERA,
Odense Univ. (Denmark). Biological Inst.
B. L. Madsen, J. Bengtson, and I. Butz.
Limnology and Oceanography, Vol 18, No 4, p 678-681, July 1973. 1 fig, 1 tab, 9 ref.

Descriptors: *Aquatic insects, *Mature growth stage, *Migration patterns, Mayflies, Stoneflies, Upstream, Downstream, Sexual maturity, Spatial distribution.
Identifiers: *Imagines, Imagoes, Brachyptera risi, Caenis rivulorum, Baetis rhodani, Baetis vernus, Ephemerella ignita, Nemoura cinerea, Nemoura flexuosa.

The migration of the imagines of some stream insects was investigated using sticky traps prepared with transparent polyethylene sheets to which had been applies a layer of sticky adhesive (Tanglefoot). The sheets were set up transversely over the stream, using a wooden frame or wires with one sticky side facing upstream and the other downstream. The plecopteran Brachyptera risi showed upstream migration; Nemoura sp. did not. The ephemeropterans Caenis rivulorum, Baetis (rhodani and vernus), and Ephemerella ignita all showed upstream migration. (Holoman-Battelle)

DIFFUSION,
Deutsches Hydrogaraphisches Institut, Hamburg (West Germany).
H. Weidemann.
In: North Sea Science; Proceedings of NATO North Sea Science Conference, November 15-20, 1971, Aviemore, Scotland: Massachusetts Institute of Technology, p 58-72, 1973. 4 fig, 38 ref.

Descriptors: *Diffusion, *Advection, *Dispersion, *Sea water, Thermal stratfication, Ocean currents, Tides, Turbulence, Mixing, Path of pollutants.
Identifiers: *North Sea.

One of the most important physical properties of the marine environment, with respect to pollution questions, is its capability to transport substances injected at any point to other, distant places. Two different dynamic processes are responsible: advection by currents; and diffusion due to turbulent motions. The shape of a patch which develops from an originally circular or point source does not usually remain circular. In most cases, it becomes more or less elliptical or elongated, due mainly to vertical current shear. Sometimes it is torn into several parts, particularly when and where current divergences or large-scale eddies occur. The distributions measured during calm weather tend to show greater elliptical eccentricity than those obtained during rough weather periods. Substances released at the surface are gradually transported downward by vertical diffusion processes, but only as far as the depth of the thermocline. The vertical current shear, particularly with wind drift currents, results in an unsymmetric cross-section of the patch: at the windward end, the concentration at the surface will be less than in the deeper layers, while at the downwind end the contamination is concentrated in a surface layer which is shallow compared with its depth in the center of the patch. SEDIMENT DISTRIBUTION IN THE NORTH SEA IN RELATION TO MARINE POLLUTION,
Netherlands Inst. of Oceanography, Texel.
D. Eisma.
In: North Sea Science; Proceedings of NATO North Sea Science Conference, November 15-20, 1971, Aviemore, Scotland: Massachusetts Institute of Technology, p 131-150, 1973. 6 fig, 52 ref.

Descriptors: *Bottom sediments, *Sediment transport, *Path of pollutants, Sea water, Mercury, Industrial wastes, Water pollution sources, Ocean circulation, Currents (Water).
Identifiers: *North Sea.

The bottom sediments of the North Sea are chiefly of Holocene age and only a few meters thick, covering sediments and a surface relief mainly formed during the Pleistocene. The presence of increasing amounts of waste mercury from the Rhine in Dutch Wadden Sea sediments points to a large scale accumulation of mercury in that area. It is important to look for accumulation of waste substances other than mercury in the sediments and to do so in all areas of active sedimentation: the Wadden Sea, the estuaries, the fjords, the deep channels in the North Sea, the inner German Bight, and the Skagerrak, and the Norwegian Trough. In addition, the areas where iron hydroxides are being deposited may be important, as is probably the case off the Rhine-Meuse estuary and near the Thames, and at or near the areas where waste acids are being disposed of. There are three good reasons for determining, besides the fundamental physical and chemical processes involved, the distribution and the possible fate of waste substances in the bottom sediments of the North Sea: (1) the present lack of knowledge concerning seabed pollution; (2) the desirability to obtain good measurements of dissolved oxygen; and (3) the need to be able to predict the consequences of regulations and certain practices and accidents, especially on a long-term basis. (Knapp-USGS)

OCCURRENCE AND BEHAVIOUR OF HEAVY METALS IN RIVER DELTAS, WITH SPECIAL REFERENCE TO THE RHINE AND EMS RIVERS,
Institute for Soil Fertility, Groningen (Netherlands).
A. J. De Groot.
In: North Sea Science; Proceedings of NATO North Sea Science Conference, November 15-20, 1971, Aviemore, Scotland: Massachusetts Institute of Technology, p 308-325, 1973. 5 fig, 5 tab, 9 ref.

Descriptors: *Path of pollutants, *Heavy metals, *Mercury, Water pollution sources, Rivers, Industrial wastes.
Identifiers: *Rhine River (Netherlands).

The contents and behavior of a number of heavy metals in the suspended material of the highly polluted Rhine are described, together with the situation in the unpolluted estuary of the Ems. The fates of heavy metals in suspended matter (mud) can only be studied efficiently, however, if the transport paths of the material from the rivers to the marine coastal areas are well known. The load of heavy metals of the Rhine water fluctuates; the mean contents of As and Hg, however, are 5.6 and 0.3 micrograms per liter, respectively. Upstream there is a more pronounced occurrence of Hg, As, and Cu in the suspended materials, so the transport of these metals mainly takes place in a solid form. Downstream from the freshwater tidal area of the river, however, some metals are mobilized more or less, going into solution in the surrounding water as organometallic complexes. (Knapp-USGS)

WATER WELL STANDARDS--ARROYO GRANDE BASIN, SAN LUIS OBISPO COUNTY,
California State Dept. of Water Resources, Sacramento.
J. F. LoBue, and L. J. Olsen.
Available from State of California, Documents Section, P.O. Box 20191, Sacramento, Calif 95820 - Price $1.50. Bulletin No 74-7, July 1971. 35 p, 4 fig, 5 tab, 30 ref.

Descriptors: *Groundwater resources, *Water wells, *Well regulations, *Design criteria, *California, Legal aspects, Water pollution sources, Infiltration, Groundwater movement, Aquifer characteristics, Barriers, Cements, Sewage, Irrigation water, *Water quality standards.
Identifiers: *Well design.

During the past 20 years, considerable public and private concern has been expressed over the high nitrate concentration in the groundwater of the Arroyo Grande Basin of San Luis Obispo County, which lies within the Arroyo Grande hydrologic subarea of California. Groundwater degradation by nitrate has generally coincided with increased water use and waste discharge in the basin. In localized areas, irrigation return water, sewage, and other poor quality water have migrated downward into the water-bearing zones and have impaired the groundwater for certain beneficial uses. Standards are established to prevent impairment of water quality resulting from (a) improperly constructed wells; (b) improperly destroyed wells; or (c) defective wells. They apply also to those wells in use requiring modification and to those to be destroyed. The standards should be used in well construction or destruction in the Arroyo Grande subarea. However, in some parts of the basin, groundwater conditions necessitate supplementing statewide well standards. For example, because the deeper aquifers usually contain better quality water than the shallower, measures must be taken to seal off wells in the shallower aquifers to prevent the impaired water from invading the deeper aquifers. LONG-TERM STABILITY OF WASTE LIGNINS IN AQUATIC SYSTEMS,
Swedish Water and Air Pollution Research Lab., Stockholm.
H. O. Bouveng, and P. Solyom.
Svensk Papperstidning, Vol 76, No 1, p 26-29, January 20, 1973. 6 fig, 4 tab, 6 ref.

Descriptors: *Lignins, *Pulp wastes, *Bleaching wastes, *Biodegradation, *Water pollution sources, Pine trees, Coniferous trees, Chlorination, Degradation (Decomposition), Industrial wastes, Pulp and paper industry, Effluents, Pollutants, Sulfonates, Freshwater.
Identifiers: *Spruce trees, Kraft lignin, Kraft mills, Lignosulfonates, Spent sulfite liquor, Sulfite mills, Oxygen bleaching, Alkaline extraction.

The organic content of lignin-containing pine kraft pulp mill effluents underwent ca. 94% degradation in freshwater within 40 weeks, whereas only 60% of the organic load in spruce sulfite mill effluents was degraded in the same time, the remaining 40% remaining biologically stable. Effluents from pine kraft pulp bleaching stages (chlorination, alkaline extraction, and oxygen bleaching) showed stabilities comparable to those of lignosulfonic acids. These findings, obtained under conditions of enhanced biological activity, are better than the decomposition rates to be expected under industrial conditions. They show also that organic matter in ligniferous pulp mill effluents comprises two distinct fractions, one being readily biooxidized in 10 weeks, the other remaining practically unaffected, except for waste lignin from kraft digestions ofwhich about 70% is removed beyond 10 weeks' time. Pulp and Paper Magazine of Canada, Vol 74, Convention issue, p 97-106 (Technical Paper T113-122), March 1973. 2 fig, 15 tab, 7 ref.

Descriptors: *Pulp wastes, Fish, *Pollutant identification, *Odor, *Taste, *Bleaching wastes, *Bioassay, Water analysis, Waste water (Pollution), Pulp and paper industry, Organoleptic properties, Costs, Water pollution treatment, Waste water treatment, Sulfite liquors, *Canada.
Identifiers: Kraft mills, Sulfite mills, Vanillin.

Effluent sources in the Cornwall (Ontario) mill of Domtar Fine Papers Ltd. which contribute most to the taste, odor, and fish tainting potential have been identified, and the effects of various kraft and sulfite pulp and paper mill effluents (including bleach plant and vanillin manufacturing wastes) on the receiving water and on fish have been studied. The effectiveness of various laboratory and pilot plant treatments was determined by chemical analysis for the most common pollutants and by organoleptic evaluation of taste and odor thresholds and fish flavor. Comparisons of capabilities and costs for the most promising control treatments have been made. (Brown-IPC)

DISPERSION OF POLLUTANTS IN SATURATED POROUS MEDIA,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
A. K. Tyagi, and D. K.Todd.
Available from the National Technical Information Service as PB-226 596 $3.00 in paper copy; $1.45 in microfiche. Paper presented at Fall Meeting of American Geophysical Union, December, 1971. 14 p, 7 fig, 13 ref. OWRR B-020-ARIZ (2).

Descriptors: *Path of pollutants, *Saturated flow, *Porous media, *Tracers, Mathematical studies, Forecasting, Equations, Groundwater movement, Diffusion, Dispersion, Analytical techniques, Water pollution sources, Hydrogeology.

An analytic solution has been derived to predict the dispersion of pollutants in homogeneous, isotropic and saturated porous media. In order to define the dispersion phenomenon, the coefficients of longitudinal and transverse dispersion must be determined. Relationships for the two coefficients under specific boundary conditions are presented. Since the variables characterizing the properties of fluid, porous medium, and tracer influence the dispersion of a pollutant, two dimensionless parameters, namely, the inverse Schmidt number and the molecular Peclet number, were obtained. Using these parameters, the experimental data on longitudinal and transverse dispersion were compiled and analyzed over a wide range of the flow velocity, grain size, and molecular diffusion of tracer. Good comparisons were obtained between observed and predicted coefficients of dispersion. (Woodard-USGS)

PROCESSES CONTRIBUTING TO THE NUTRIENT DISTRIBUTIONS OFF THE COLUMBIA RIVER AND STRAIT OF JUAN DE FUCA,
Washington Univ., Seattle. Dept. of Oceanography.
U. Stefansson, and F. A. Richards.
Limnology and Oceanography, Vol 8, No 4, p 394-410, October 1963. 11 fig, 2 tab, 19 ref.

Descriptors: Washington, Oregon, *Columbia River, *Nutrients, *Estuaries, *Upwelling, Seasonal, *Mixing, Silicates, Nitrates, Phosphates, Dissolved oxygen.
Identifiers: R/V Brown Bear, *Strait of Juan de Fuca, River plumes.

The distribution of salinity, dissolved oxygen, silicate, nitrate, and phosphate off the Washington and Oregon coasts, both inside and outside the Columbia River plume, were observed during 12 cruises of the RV Brown Bear between January 1961 and April 1962. Nutrients are supplied to the surface waters off the Washington and Oregon coasts from rivers and from the deeper layers of the ocean. The deep water enters the surface layers by entrainment, especially in the estuarine-like circulation in the Strait of Juan de Fuca; by upwelling, particularly off the Oregon coast in summer; and by upward mixing into the photic zone. The most important river source of nutrients is the Columbia River, which supplies high concentrations of phosphate and nitrate to its 'plume,' those waters appreciably diluted by its admixture. In winter, the plume waters are approximately simple mixtures of Columbia River and surface seawater, and their silicate and nitrate concentrations can be predicted from the salinity. In the spring and summer, nutrients are also added by the admixture of upwelled deep water and removed by photosynthetic fixation. The amounts thus added or removed have been estimated as departures, or anomalies, from the composition of simple mixtures of river and surface seawaters. These anomalies are compared with each other, with the average composition of plankton material, and with other evidences of biological activity, both in terms of correlations with each other and of horizontal distributions in the upper 10 m. GROWTH OF AN ADHERENT MIXED MICROBIAL CULTURE IN A SUBSTRATE LIMITED SINGLE STATE CHEMOSTAT,
Ohio State Univ., Columbus. Dept. of Microbiology.
R. M. Pfister.
Available from the National Technical Information Service as PB-226 309 $2.75 in paper copy, $1.45 in microfiche. Ohio State University Project Completion Report No. 391X, September 1973. 14 p, 1 fig, 5 tab, 14 ref. OWRR A-021-OHIO (1).

Descriptors: Microorganisms, *Aquatic microorganisms, Nutrient requirements, Secondary productivity, Food webs, *Food chains, Cultures, *Bacteria, *Ecosystems.
Identifiers: Chemostat.

The objective was to develop a continuous culture system with two bacterial cultures, one of which was adherent to the wall of the chemostat. By developing such a laboratory model, microbial interactions in certain aquatic ecosystems (e.g. river sediments) can be further understood. A steady-state was established between a Chromobacterium lividum and a Pseudomonas sp. at a dilution rate of 0.27 hr-1 when the growth limiting substrate was citrate. During both pure and mixed continuous culture studies the C. lividum adhered to the wall of the chemostat and the Pseudomonas showed no such tendency visually. This system offers a convenient model for studying the importance of bacterial adherence to certain aquatic ecosystems such as river sediments and sewage treatment.
W74-02661

PARTIAL RECOVERY OF A VEGETATION IN A POLLUTION DAMAGED MARSH,
Massachusetts Univ., Amherst. Water Resources Research Center.
C. J. Burk.
Available from the National Technical Information Service as PB-226 303 $3.00 in paper copy, $1.45 in microfiche. Publication No. 27, February 1973. 28 p, 6 fig, 3 tab, 9 ref. OWRR A-042-MASS (1).

Descriptors: *Vegetation regrowth, *Pollution abatement, Massachusetts, Revegetation, Mathematical studies, Computer programs, Aquatic plants, Birds, Varieties, Wild rice, Marshes, Marsh plants.
Identifiers: *Arcadian Wildlife Sanctuary (Mass.), Northampton (Mass.), Mill River (Mass.), Ricecutgrass, Water clover, Shannon-Weiner function, Pickerelweed.

Partial recovery of vegetation in a damaged freshwater marsh (Arcadia Wildlife Sanctuary at the mouth of the Mill River in Northampton, Massachusetts) after major sources of pollution were eliminated is described. A municipal dump was relocated and increasingly strict restrictions on release of industrial waters were imposed. Two industries, previously major sources of pollution, installed or were installing treatment methods. Vegetation diversity was measured by species richness, total number of species sampled, average number of species per quadrat, and the Shannon-Wiener function, an index of information content. Diversity by each of these criteria was greater in all zones in 1971 than in 1969. Total coverage also increased in all zones throughout this period. Those species initially present within each zone at the beginning of the study period accounted for much of the increase in cover while species formerly absent from sampled areas within each zone contributed most of the increased diversity. Rice cutgrass (Leersia oryzoides), dominant pioneer on exposed sediments in the Mill River ecosystem, showed a striking increase in coverage. Water clover (Marsilea quadrifolia), an exotic species associated with man-made disturbance along the lower portions of the stream, invaded the marsh during 1969, a period of extreme disturbance, and persisted throughout the recovery period. (Jones-Wisconsin)

THE BIOGEOCHEMISTRY OF DEVILS LAKE, NORTH DAKOTA,
North Dakota Univ., Grand Forks. Dept. of Biology; and North Dakota Univ., Grand Forks. Dept. of Geology.
R. Tubb, D. W. Anderson, R. Armstrong, and E. Callender.
Available from the National Technical Information Service as PB-226 306 $3.75 in paper copy, $1.45 in microfiche. North Dakota Water Resources Research Institute Technical Completion Report WI-221-017-73, June 1973. 90 p. 18 fig, 14 tab, 70 ref. OWRR A-006-NDAK (3). 14-01-001-804, 14-01-001-979.

Descriptors: *Limnology, *Biochemistry, *Geochemistry, *North Dakota, Zooplankton, Primary productivity, Phytoplankton, Water chemistry, Alkalinity, Calcium, Magnesium, Sodium,

Potassium, Chlorides, Sulfates, Iron, Silica, Interstices, Sediments, Particle size, History, Sands, Gravels, Clays, Silts, Analytical techniques, Carbonates, Phosphorus, Nitrogen, Hydrogen ion concentration, Oxidation-reduction potential, Mineralogy, Salinity, Iowa, Nannoplankton.
Identifiers: *Devils Lake (N.D.), Holocene chronology.

Plans to restore North Dakota's Devils Lake to a higher level through diversion of Missouri River water prompted study of the physical, biological, and chemical conditions to determine the lacustrine system and how it evolved. Circumstantial evidence shows that ultraplankters are responsible for virtually all of the productivity. Total annual production, in spite of the relatively short growing season, qualifies Devils Lake as highly productive or eutrophic. Energy budget showed a net loss of potential energy from the system even though total annual gross production was rather high and zooplankton grazing was the most important factor controlling size of phytoplankton standing crop. Salinity date indicate the lake was fresh approximately 150 years ago. Inorganic precipitation of high-magnesian calcite results from very high carbonate supersaturation caused by phytoplankton photosynthesis. Depositional rate of authogenic chemical components has generally decreased with increasing age. Sulfate content of interstitial water sediment can be used to estimate paleosalinity variation during the past 6000 years. Low metastable carbonate content of shallow-water sediment indicates frequent exposure to 'fresh' surface-water and groundwater seepage. Lake level has fluctuated considerably during the past 6000 years. (Jones-Wisconsin)
W74-02664

STUDIES ON SELECTED MYXOBACTERIA PATHOGENIC FOR FISHES AND ON BACTERIAL GILL DISEASE IN HATCHERY--REARED SALMONIDS,
Bureau of Sport Fisheries and Wildlife, Kearneysville, W. Va. Eastern Fish Disease Lab.
G. L. Bullock.
U S Bur Sport Fish Wildl Tech Pap. 60. p 3-30. 1972. Illus.
Identifiers: Bacterial diseases, Chondrococcus-columnaris, Cytophaga-psychrophila, Fish, Hatchery, *Myxobacteria (Pathogenic), *Salmonids (Gill disease).

Morphological, physiological and serological studies on 55 myxobacteria isolated principally from gill disease, tail rot and other myxobacterial infections showed that a variety of myxobacteria occur in these infections. Although there were different morphological types of myxobacteria, all strains from freshwater and estuarine sources were physiologcally similar. Isolates from marine sources were physiologically less active than the other test organisms. Agglutinin reactions of test myxobacteria showed many types; serological relationships of many of the test strains to Chondrococcus columnaris and Cytophaga psychrophila were shown by the agar gel precipitin reactions. Studies on fingerling trout showed that gill disease can be induced within 2 wk by crowding, exposure to ammonia and low oxygen and factors not measured. When live diseased fingerlings were added to aquarium water containing stressed trout the disease occurred within a week; attempts to transmit gill disease to stressed trout with cultures of myxobacteria, with other eubacteria isolated from diseased tissue, or with dead diseased fingerlings were unsuccessful. Bacterial gill disease failed to develop in trout exposed to 0.5-2.5 ppm ammonia, 4.0-5.0 ppm dissolved oxygen, or to both ammonia and low oxygen. Three species of yearling trout from 4 hatcheries were found to have low levels of agglutinins against myxobacteria isolated from gill disease, tail rot and trout skin. Cross absorption studies with 10 of these cultures indicated common antigens.--Copyright 1973, Biological Abstracts, Inc.

THE POLLUTION POTENTIAL IN PESTICIDE MANUFACTURING.
Midwest Research Inst., Kansas City, Mo.

Available from the National Technical Information Service as PB-213 782, $6.75 in paper copy, $1.45 in microfiche. Environmental Protection Agency, Rural Wastes Branch, Technical Studies Report TS-00-72-04, June 1972. 275 p, 46 fig, 28 tab, 3 append. EPA-OWP 69-01-0142.

Descriptors: *Pesticides, *Hazards, *Pesticide residues, *Environmental effects, Formulation, Marketing, Volume, Industries, Waste treatment, Waste disposal, Air pollution, Pollutants, Water pollution, Toxicity, Economic impact, Water pollution control, Estimated costs, Storage, Waste water treatment, Incineration.
Identifiers: *Pollution potential, *Pesticide industry, Pesticide manufacture, Detoxification.

Although pesticide use has resulted in positive benefits, it has been achieved only with some undesirable side-effects. The present study surveys and evaluates the potential environmental pollution associated with the manufacture, formulation, and marketing of pesticides. A complete and detailed survey of current production volumes was inhibited due to restrictions on disclosure of the data, however an estimate based on categorized and grouped data available through the Tariff Commission indicated that the 13.4 billion pounds per year pesticide market is dominated by 24 products or product groupings which account for 64% of this production. The remaining 26% is divided between about 250 other pesticides. Twenty-two representative pesticides were selected for intensive study of pollution associated with their manufacture. Preliminary review indicated that sizable losses of potential pollutants occur during the pesticide production process which are not detoxified by existing waste treatment facilities. Formulators of pesticides were found to have less extensive waste treatment facilities although their short formulation runs generate considerable waste. Development of principles and procedures for minimizing waste generation and release for both normal and emergency conditions are urgently recommended. (Weaver-Wisconsin)

AN ECOLOGICAL STUDY ON THE SO--CALLED MOGAI (ANADARA SUBCRENATA (LISCHKE)) CULTURED IN THE KASAOKA BAY (IN JAPANESE),
Hiroshima Univ. (Japan). Faculty of Fisheries and Animal Husbandry.
Y. Y. Ting, S. Kasahara, and N. Nakamura.
J Fac Fish Anim Husb Hiroshima Univ. Vol 11, No 1, p 91-110. 1972. Illus. (English summary).
Identifiers: *Anadara-subcrenata, Bays, *Ecological studies, Fertilization, *Japan (Kasaoka Bay), Maturation, Mogai, Salinity, Spawning, Water pollution, Industrial wastes, Bivalves.

The so-called 'Mogai,' A. subcrenata (a kind of ark shell) is one of the most important bivalves in the Seto Indland Sea, but in recent years the area of its culturing grounds is gradually decreasing due to reclamation works and water pollution through the release of industrial wastes. This study was carried out mainly to clarify the environmental conditions of Mogai culturing grounds in Kasaoka Bay, Okayama Prefecture (Japan); the growth of Mogai as well as the maturation of gonad; the artificial inducing of spawning and the effect of chlorinity upon the fertilization and the early development.--Copyright 1973, Biological Abstracts, Inc.

LOWER FUNGI AS TEST ORGANISMS OF POLLUTANTS IN SEA AND BRACKISH WATER: THE EFFECTS OF HEAVY METAL COMPOUNDS AND PHENOL ON THRAUSTOCHYTRIUM STRIATUM (IN GERMAN),
Kiel Univ. (West Germany). Institut fuer Meereskunde.
J. Schneider.
Mar Biol (Berl). Vol 16, No 3, p 214-225. 1972. Illus. (English summary).
Identifiers: *Brackish water, Compounds, *Fungi, *Heavy metals, Organisms, *Phenols, Pollutants, *Sea water, Tests, *Thraustochytrium-striatum, Toxicity, Water pollution.

Three test-series were applied, which differed in regard to the basal medium (natural or artificial sea water, salinity level, addition of detergent); the culture conditions (primary cultures, subcultures, back-inoculations into basal medium without toxic metals); the criterion employed (zoospore activity, sporangia development, or dry weight of T. striatum Schneider). The temperature applied was 18-20C. The sea water-pollen-method (MWP) was the most suitable: it is simple and more sensitive than the other tests; subcultures and back-inoculations are possible without much additional work; conditions simulate nature; first results are available after 3-4 days. The SMS-method (enriched natural sea water of different salinities) provides additional information on salinity effects. Nine substances were tested: (CH3COO)2Hg, HgCl2, CdCl2.H2O, ZnSO4.7H2O, NiSO4.7H2O, CuSO4.5H2O, CoCl2.6H2O, MnCl2.4H2O, and phenol. In regard to their toxicity these substances can be divided into 2 groups: Hg - and Cd-salts inhibit development down to greater dilutions than the remainder; Zn and Ni seem to yield intermediate effects. Salinity modifies the toxic effects of the test substances. In higher salinities, comparable concentrations of test substances reveal stronger inhibitory effects than in lower salinities. Detergents may augment the toxic effects, at least of CuSO4. The marine lower fungus T. striatum is a useful organism for testing biological consequences of water pollutants.--Copyright 1973, Biological Abstracts, Inc.

AN ANNUAL PLANKTON CYCLE ON THE CHESAPEAKE BAY IN THE VICINITY OF CALVERT CLIFFS, MARYLAND, JUNE 1969 - MAY, 1970,
Academy of Natural Sciences of Philadelphia, Pa. Dept. of Limnology; and Academy of Natural Sciences of Philadelphia, Benedict Md. Benedict Estuarine Lab.
R. A. Mulford.
Proceedings of the Academy of Natural Sciences of Philadelphia, Vol 124, No 3, p 17-40, November 24, 1972. 6 fig, 13 tab, 19 ref.

Descriptors: *Chesapeake Bay, *Aquatic microorganisms, Population, *Plankton, Zooplankton, Aquatic environment, Phytoplankton, Dinoflagellates, Diatoms, Hydrography, Seasonal, Distribution patterns, On-site data collections, Evaluation, Nuclear powerplants, *Thermal pollution, Maryland.
Identifiers: *Calvert Cliffs powerplant, Species diversity.

A submersible pump was used to obtain samples of net (10 micrometers) phytoplankton at surface and near bottom from four stations positioned along Chesapeake Bay in the vicinity of the proposed Calvert Cliffs Nuclear power plant. The study, conducted for 11 months, yielded information on the succession, abundance and diversity of phytoplankton. Data indicate that 13 species of diatoms, 1 dinoflagellate species and tintinnids as a group represent the greatest percentage of the community throughout the annual cycle. The above species, along with total population diversity, and a list of predicted seasonal dominant organisms are discussed. (Jerome-Vanderbilt)

WATER USE FOR AQUATIC LIFE,
La Salle Coll., Philadelphia, Pa. Dept. of Biology.
C. B. Wurtz.
Water Quality Criteria, American Society for Testing and Materials, Special Technical Publication 416, Philadelphia, p 81-89, 1967. 6 ref.

Descriptors: *Water quality standards, *Aquatic life, *Pollutants, *Standards, Water quality, Aquatic environment, Temperature, Wastes, Effluents, Dissolved oxygen, Water pollution, Organic compounds, Industrial wastes, Sewage, Fish, Water utilization.

Aquatic life in general is quite tolerant of deteriorated water. Aquatic organisms vary in their responses to environmental alteration. Compared to the quality of water required for domestic and industrial uses, the aquatic life of the nation is not very demanding. To protect all water-use interests, pollution must be defined, criteria for natural waters developed, and standards for specific discharges fixed. It is probable that no single, equitable set of criteria for aquatic life can be established over a geographic area larger than the basin of a first-or second-order tributary of the major rivers. Water quality change brings about concomitant biological change, but extreme conditions must exist and be persistent before aquatic life is eliminated. Environmental control is essential if optimal conditions for aquatic life are to be developed and maintained. Waste disposal, properly controlled, need not conflict with the use of water for aquatic life. (Jerome-Vanderbilt)

TEMPERATURE TRENDS AND THE DISTRIBUTION OF GROUNDFISH IN CONTINENTAL SHELF WATERS, NOVA SCOTIA TO LONG ISLAND,
National Marine Fisheries Service, Woods Hole, Mass. Northeast Fisheries Center.
J. B. Cotton, Jr.
Fishery Bulletin, Vol 70, No 3, p 637-657, 1972. 12 fig, 46 ref.

Descriptors: *Temperature, Fish, *Marine fish, *Distribution patterns, Sea, Heated water, Spawning, Spatial distribution, *Water temperature, Atlantic Ocean, *Continental shelf.
Identifiers: Haddock, Flounder, Butterfish, Nova Scotia, Long Island, *Groundfish.

The 1953 to 1967 downward trend in seawater temperature in continental shelf waters between Nova Scotia and Long Island did not significantly alter the distribution of four species of groundfish. There was an extension of the southern range of American plaice and a contraction of the northern range of butterfish. These shifts in distribution were not extensive. The equatorward boundary of American plaice appears to be limited by summer temperatures too high for survival and the poleward boundary of butterfish by summer temperatures too low for reproduction. There was no obvious alteration in the geographic distribution of haddock and yellowtail flounder. The distribution and movements of haddock and yellotail flounder appear to be influenced more by restrictive spawning area and bottom type conditions than by temperature. (Oleszkiewicz-Vanderbilt)

THERMAL REQUIREMENTS FOR MATURATION, SPAWNING, AND EMBRYO SURVIVAL OF THE BROOK TROUT, SALVELINUS FONTINALIS,
National Water Quality Lab., Duluth, Minn.
K. E. F. Hokanson, J. H. McCormick, B. R. Jones, and J. A. Tucker.
Journal of the Fisheries Research Board of Canada, Vol 30, No 7, p 975-984, 1973. 6 fig, 5 tab, 28 ref.

Descriptors: *Brook trout, *Growth rates, *Water temperature, *Spawning, Aquatic environment, Fish, Temperature, Seasonal, Environmental effects, Reproduction, Growth, Water quality, Laboratory tests, Mature growth stage, Embryonic growth stage, *Thermal pollution.

Thermal requirements for brook trout reproduction were determined at a natural daylength cycle and five constant temperatures (10-21C) and one treatment that followed the seasonal temperature regime of Lake Superior. The optimum range for growth (unrestricted rations) and relative condition factor was 10-19C. Survival was 90% or greater and general growth and secondary sexual characteristics were well developed at all temperatures. The maximum temperature at which males became functionally mature was 19C and lower. Water temperature had influence on spawning activity and egg viability. The upper median effective temperature for the number of viable eggs spawned per female was 11.7C. The upper median tolerance limit for normal hatch was 12.7C. Thermal criteria that recognize seasonal changes in their thermal requirements are recommended for self-sustaining brook trout populations. (Jerome-Vanderbilt)

THE REALITIES OF THERMAL POLLUTION - ENVIRONMENTAL LIMITATIONS AND ECOLOGICAL ADAPTATIONS,
La Salle Coll., Philadelphia, Pa.
C. B. Wurtz.
Paper presented at 17th Southern Water Resources and Pollution Control Conference University of North Carolina, April 16-18, 1968. 11 p, 7 ref.

Descriptors: *Heated water, *Environmental effects, *Habitats, *Biological communities, Aquatic environment, Discharge (Water), Electric power production, Effluents, Aquatic animals, Fish, Adaptation, Temperature, On-site-data collections, Laboratory tests, Measurement, *Thermal pollution.

The effects of heated effluents on the biological communities of various aquatic habitats and the relative technological and economic merits of various environmental conditions are discussed. Although specific aquatic organisms survive best under certain thermal conditions it has been shown that most species can adapt to a fairly wide range of temperatures. Most aquatic life is found in a 73 degree temperature range from 32 F to 105 F. Field observations generally show an adaptive ability much greater than the 2 or 3 degrees F per hour rate claimed by many studies. It is accepted that a small temperature change can sometimes make a significant difference in the resident species composing the natural community of an aquatic habitat. But, it is suggested that the maintenance of the natural biological community is not always in the best interests of the human community. In some cases alteration of the aquatic habitat may be considered desirable. The modification of the Connecticut River is presented as an example of the thermal modification of an aquatic environment. Transport of wastes in natural waters is seen as a resource. (Jerome-Vanderbilt)

INFLUENCE OF TEMPERATURE ON ENERGY UTILIZATION OF EMBRYONIC AND PROLARVAL TAUTOG, TAUTOGA ONITIS,
National Marine Fisheries Service, Narragansett, R.I. Narragansett Lab.
G. C. Laurence.
Journal of the Fisheries Research Board of Canada, Vol 30, No 3, p 435-442, 1973, 1 fig, 3 tab, 19 ref.

Descriptors: *Temperature, *Fish, *Oxygen, Biochemistry, Aquatic environment, Reproduction, Growth rates, Growth stages, Metabolism, Fish eggs, Oxygen, Environmental effects.
Identifiers: *Tantog.

When daily energy budgets were calculated by two methods for tautog, Tautoga onitis, from fertilization to complete yolk absorption at three temperatures (16, 19 and 22 C), neither method indicated a deficiency of yolk energy for growth and metabol-

ism prior to exogenous feeding capability. Deficits were indicated on the day of feeding capability at all temperatures by the oxygen consumption method, the more precise but less inclusive of the two. The dry weight method, which gave the more conservative estimates, indicated no deficit for the entire period of yolk absorption at 16 C, a deficit one day after feeding capability at 19 C, and a deficit on the day of feeding capability at 22C. Regression analysis of oxygen consumption indicated that 22 C may be in the upper temperature limits for normal metabolism by embryonic and prolarval tautog. Yolk utilization efficiencies and postlarval size at complete yolk abosrption tended to be inversely related to temperature. The ecological implications and the effects of temperature on the critical timing involved in the interactions of feeding capability, availability of prey and occurrence of energy deficits are discussed. (Tirfie-Vanderbilt)

BIOCHEMICAL EFFECTS OF TEMPERATURE AND NUTRITIVE STRESS ON MYTILUS EDULIS L,
Natural Environment Research Council, Anglesey (Wales). Unit of Marine Invertebrate Biology.
P. A. Gabbott, and B. L. Bayne.
Journal of the Marine Biology Association of United Kingdom, Vol 53, No 2, p 269-286, 1b73, 6 fig, 8 tab, 17 ref.

Descriptors: Biochemistry, *Temperature, *Mussels, *Nutrients, Food abundance, Metabolism, Laboratory tests, Stress, Reproduction, Water pollution effects.

Mussels were subjected to low food levels and constant temperature (15 C) for prolonged periods in four experiments. The metabolic rate was low in autumn and the energy absorbed was equal to the energy demand. The oxygen consumption rapidly declined in spring as a result of stress. In the winter, animals were out of energy balance, using stored reserves. During stress the rate of amino-Ni efflux formed an important component of the energy budget. At temperatures above ambient in the winter the rate of gametogenesis was increased, which resulted in increased energy demand and high oxygen consumption. If food is scarce, part of this demand is met from stored reserves, primarily protein and carbohydrate. This ensures normal development of gametes in the winter. Later, when vitellogenesis is complete and reserves are depleted, stress results in rapid fall in oxygen consumption. There is a marked seasonal shift from a reliance on carbohydrate as the main energy reserve in the summer to a greater reliance on protein as the main reserve in the winter. (Tirfie-Vanderbilt)

EFFECTS OF TEMPERATURE ON EMBRYONIC DEVELOPMENT OF LAKE HERRING (COREGONUS ARTEDII),
Ministry of Natural Resources Thunder Bay (Ontario). Fisheries Research Branch.
P. J. Colby, and L. T. Brooke.
Journal of the Fisheries Research Board of Canada, Vol 30, No 6, p 799-810, 1973, 3 fig, 7 tab, 15 ref.

Descriptors: *Herrings, *Growth rates, *Embryonic growth stage, *Water temperature, Aquatic environment, Aquatic life, Fish, Lakes, Temperature, Time, Growth stages On-site data collections, Laboratory tests, Environmental effects, Mathematical models, Forecasting, Statistics, Regression analysis, *Michigan, *Thermal pollution.

Embryonic development of lake herring (Coregonus artedii) was observed in the laboratory at 13 constant temperatures from 0.0 to 12.1C and in Pickerel Lake (Washtenow County, Michigan) at natural temperature regimes. The rate of development during incubation was based on progression of the embryos through 20 indentifiable stages. An equation was derived to predict the development stage at constant temperatures on the general assumption that development stage is a function of time and temperature. The equation should also be useful in interpreting estimates from regressions that include other environmental variables that affect egg development. A second regression model derived primarily for fluctuating temperatures, related development rate at development stage, expressed as the reciprocal of time, to temperature. The time in the natural habitat correlated closely with the predicted rates of development. (Jerome-Vanderbilt)

THE COOLING WATER OF POWER STATIONS: A NEW FACTOR IN THE ENVIRONMENT OF MARINE AND FRESH-WATER INVERTEBRATES,
Central Electricity Generating Board, Southampton (England). Marine Biological Lab.
S. Markowski.
Journal of Animal Ecology, Vol 28, No 2, p 243-258, 1959, 2 fig, 6 tab, 3 ref.

Descriptors: *Thermal power plants, *Heated water, *Cooling water, *Aquatic animals, Electric power plant production, Thermal pollution, Environmental effects, Aquatic environment, *Marine animals, Mortality, Growth, Reproduction, On-site data collections, Intakes, Outlets, Effluents, Turbulence, Chlorination, Dissolved oxygen, Bioassay, Algicides, Condensation.
Identifiers: Great Britain.

A general picture of the conditions created by power stations in freshwater and marine environments and some information on the species involved and their response to those conditions are presented. Samples of intake and outfall water from 12 power plants located in areas where the conditions were altered as little as possible by the other industrial disturbances were collected and examined during 1955-7. Descriptions of an open versus closed and mixed cooling systems are presented in respect to their effects on aquatic organisms. The principal changes created by the use of water for power plant cooling are: the increase of pressure caused by pumps; the rise in temperature; the injection of chlorine; turbulence; and the conversion of the water into a heavy rainfall when passed through cooling towers. Each of these factors and its effects on aquatic life are discussed. The samples contained some 35 fresh water and 62 marine animal species were apparently unharmed by the by the temperature, turbulence, and chlorination of cooling water as the organisms found at the outfall were alive and able to reproduce. The oxygen content of the discharge water was either the same as that of the natural environment or higher. (Jerome-Vanderbilt)

OBSERVATIONS ON THE RESPONSE OF SOME BENTHONIC ORGANISMS TO POWER STATION COOLING WATER,
Central Electricity Generating Board, Southampton (England). Marine Biological Lab.
S. Markowski.
Journal of Animal Ecology, Vol 29, No 2, p 349-357 1960. 2 fig, 2 tab, 3 ref.

Descriptors: *Thermal power plants, *Cooling, *Thermal pollution, *Aquatic organisms, *Benthic fauna, Algae, Electric power plant, Heated water, Environmental effects, Aquatic environment, Metabolism, Reproduction, Growth, On-site data collections, Benthos, Outlets, Intakes, Water temperature, Chlorination, Slime, Crustaceans, Bioassay.
Identifiers: Great Britain.

Information regarding the behavior and response of benthonic and settling organisms in the intake and outfall area of a power station during one year beginning in October 1957, is presented. The results of experiments indicate that the outfall area was more favorable to growth than the intake. Although the light regime was the same, no vegetation was observed at the intake while there was a prolific growth of algae at the outfall. On the other hand, denser animal populations were found in the intake area. It seems likely that the initial stages of settling of Algae, Coelenterata, Crustacea, Mollusca and Polyzoa takes place when the power station stops operating and the water in the area is more or less still. Once established, several of the organisms remain. The general characteristics of the environment and the factors introduced by the station to the aquatic medium are discussed. (Jerome-Vanderbilt)

REVERSIBLE HEAT INJURY IN THE MARINE PSYCHROPHILIC BACTERIUM VIBRIO MARINUS MP-1,
Oregon State Univ., Corvallis. Dept. of Microbiology.
R. P. Griffiths, and R. D. Haight.
Canadian Journal of Microbiology, Vol 19, No 5, p 557-561, 1973. 6 fig, 11 ref.

Descriptors: *Marine bacteria, *Heat, *Mortality, *Metabolism, *Reproduction, Thermal pollution, Environmental effects, Biochemistry, Bacteria, Temperature, Toxicity, Inhabitors, Bioassays, Laboratory tests, Measurements, Evaluation, Analytical techniques, Water pollution effects.

A modification of the double-medium technique of Iandolo and Ordal (1966) was used to study heat injury in the obligately psychrophilic marine bacterium, Vibro marinus MP-1. Results using this technique demonstrated that heated cell suspensions contained a mixed population of uninjured, reversibly injured, and irreversibly injured (killed) cells. The age of the culture, temperature, and length of heating time influenced the ratio in the population of the various types of cells. The rapair process of reversibly injured cells was affected by the surface area-to-volume ratio of the medium used to support repair. (Jerome-Vanderbilt)

A STATEMENT PREPARED FOR SUBMISSION AT THE PUBLIC HEARING ON APPLICATION MADE BY BALTIMORE GAS AND ELECTRIC COMPANY FOR A PERMIT TO APPROPRIATE AND USE SURFACE WATER FOR OPERATION OF THE CALVERT CLIFFS NUCLEAR POWER PLANT MADE TO THE MARYLAND DEPARTMENT OF WATER RESOURCES,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
D. W. Pritchard.
Baltimore Gas and Electric Company Report, 1969, 54 p, 10 fig, 3 tab, 29 ref, 1 append.

Descriptors: Effluents, *Heated water, *Radioisotopes, *Chesapeake Bay, *Estuarine environment, Aquatic life, *Environmental effects, *Forecasting, Electric power production, Nuclear power plants, Thermal pollution, Distribution patters, Model studies, Simulation, Mixing, Tidal waters, Water quality, Water temperature, Statistics, Nuclear wastes, Radioactivity effects.

Based on the results of 20 years of studies and research, the Chesapeake Bay Institute at the request of the Maryland Department of Water Resources has prepared on evaluation of the possible effects of the use of Chesapeake Bay water for cooling a nuclear power plant. Heated discharge from the power plant is considered according to the following factors: the amount of heat rejected, the volume rate of flow of cooling water, the discharge structure design, the intake structure

esign, the physical movement and mixing of the idal water, the nontide circulation into the estua-y, and the rate of heat loss to the atmosphere. Results of computations depict the character of he thermal plume of discharged waters. Three ethods of determining the environmental ac-eptability of discharges are discussed. Thermal npact of an existing plant and of the proposed lant are compared. (Jerome-Vanderbilt)

he direct and indirect effects of heat on organ-ms entrained from the Columbia River and some chniques used for predicting thermal shocks are scussed. Small drifting organisms which are awn with cooling water through the condensers a power plant are severely affected. The verage temperature rise of water passing through ich systems is 10.8 degrees C, but the tempera-re rise is seldom much less than 7.7 degrees C. In ases where a substantial portion of a stream flow, ke or estuary volume is diverted, there is a otential for serious ecological implications. The ossibility of direct mortality of entrained organ-ms due to thermal shock seems to be very real ring the warmer months, when the temperature crease from the condenser vauses a rise above e incipient lethal temperature for many species. predictive model based on the Columbia River ear Richland, Washington showed that the tem-erature of condenser cooling water would rise ove the lethal limit for Chinook Salmon between ly 1, and October 31. Exposure time or small antities of slime or corrosion control chemicals the water may also affect the mortality rate. ub-lethal effects are also discussed. These may clude loss of equilibrium or increased susceptibility to predation. (Jerome-Vanderbilt)

escriptors: *Bioassays, *Minnows, *Water sposal, *Dilution, *Thermal pollution, Aquatic vironment, Aquatic animals, Heated water, En-ronmental effects, Mortality, Metabolism, ress, Fish behavior, Lethal dose, Temperature, valuation, Laboratory tests.

ariation in the results of five near-identical bioas-ys of fat head minnows subjected to instant increase in water temperature is examined. It is shown that median tolerance limits for an instant temperature increase can be estimated with precision, and levels of stress tolerable to more than 50% of the test fish can be estimated with somewhat lower precision. The standard deviation of the population tolerance frequency distribution can be of practical value in evaluating the effect of dilution on the lethality of wastes. TL 50 values should be used in calculations of safe levels of water quality alteration when bioassays and so called application factors are employed in regulating disposal of lethal agents. EFFECTS OF TEMPERATURE ON GROWTH AND SURVIVAL OF LABORATORY REARED LARVAE OF THE SCALED SARDINE, HARENGULA PENSACOLAE GOODE AND BEAN,
Muskingum Coll., New Concord, Ohio. Dept. of Biology.
V. P. Sakena, C. Steinmetz, Jr., and E. D. Houde.
Transactions of the American Fisheries Society, Vol 101, No 4, p 691-695, 1972. 2 fig, 1 tab, 19 ref.

Descriptors: Fish, *Water temperature, *Thermal pollution, *Larval, *Growth rates, *Sardines, Aquatic environment, Heated water, Larval growth stage, Environmental effects, Sampling, Laboratory, Testing, Plankton, Bioassay, Bioindicators, Fish pathology.

Growth and survival of scaled sardine, Harengula pensacolae, larvae were evaluated in laboratory rearing experiments at temperatures ranging from 21 to 35C. Fertilized eggs were obtained in plankton collections made near Miami, Florida, in the summer, 1971. Larvae were reared for 15 days after hatching in temperature controlled, 75-liter aquaria. Hatching success was high at all temperatures but larvae did not survive at 35C, and survival was poor at 21 to 23C. Survival was best at temperatures between 26 and 32C. Mean daily growth increments ranged from 0.056 mm at 21 to 23C to 1.035 mm at 32C. Growth in relation to temperature was expressed by the equation $Y \pm -0.8474 + 0.0537X$, where Y equals daily growth increment and X equals temperature. Larvae behavior was normal at 26 to 33.5C. Critical high and low temperatures for larval survival were 35C and approximately 20C. (Jerome-Vanderbilt)

Transactions of the American Fisheries Society, Vol 101, No 4, p 740-743, 1972. 1 fig, 2 tab, 8 ref.

Descriptors: Fish, *Shad, *Water temperature, *Thermal pollution, *Lethal limit, Aquatic environment, Effluents, Environmental, Fish behavior, On-site data collections, Migration, Migration patterns, Nuclear power plants.

Sampling of the Connecticut River has shown that young shad migrate downstream in August when water temperatures are the highest. The majority of the population is present in the vicinity of the Connecticut Yankee nuclear power plant when added heat from the plants effluent may influence their safe passage. The reactions of young shad to a heated effluent and attempts to define their upper temperature limits under conditions in the lower Connecticut River are presented. Observations of the upper lethal temperature and direct mortality were made by drifting young shad and blue-black herring in a floating live box through the heated effluent. Fish tested on September 23 had a lower mortality than those tested on October 14, probably due to a higher acclimation temperature. The upper natural temperature limit for young shad may be 30C. They avoid potentially lethal temperatures above 30C and are capable of transversing the heated effluent during their downstream migration. (Jerome-Vanderbilt)

THE EFFECT OF PHOTOPERIOD ON THERMAL RESISTANCE OF SPECKLED DACE,
Washington State Univ., Pullman. Dept. of Zoology.
E. E. Starkey, J. A. Kazmierski, M. R. Fletcher, and O. E. Maughan.
Transactions of the American Fisheries Society, Vol 101, No 4, p 715-718, 1972. 3 tab, 12 ref.

Descriptors: *Fish, *Water temperature, *Seasonal, *Biorhythms, *Adaptation, *Photoperiodism, Aquatic environment, Aquatic animals, Resistance, Thermal pollution, Laboratory tests, Bioassay, Bioindicators, Lethal limit, Pathology, Fish pathology.
Identifiers: *Stimulus response, Survival time.

Fish living in environments where the temperature of the water varies from season to season sometimes develop thermal resistance which varies adaptively. The importance of photoperiod as a stimulus to seasonal adaptation of thermal resistance in the speckled dace is examined. Specimens were captured, divided into two groups and placed in large aquaria. One group was exposed to daily photoperiods of 8 hours of light and 16 hours of dark, while the other was exposed to 16 hours of light and 8 hours of dark. After a 6 week acclimation period, fish from each tank were subjected to a range of temperatures in order to obtain some indication of survival times. Although the data do not statistically support the conclusion that seasonal photoperiod affects the temperature resistance of Phinichtys osculus, inconsistencies indicate the desirability of further work. The possible reversal of the expected photoperiodic effect, i.e., the short-day fish being more resistant to warm temperature that long-day fish, remains an enigma. (Jerome-Vanderbilt)

APPLICATION OF ALGAL BIOASSAYS IN EUTROPHICATION ANALYSES,
National Inst. for Water Research, Pretoria (South Africa).
D. F. Toerien, and D. J. Steyn.
South African Journal of Science, Vol 69, No 3, p 79-82, March 1973. 6 fig, 2 tab, 5 ref.

Descriptors: *Eutrophication, *Trophic level, *Bioassay, *Nutrients, *Analytical techniques, Water analysis, Water quality, Aquatic algae, Effluents, Aquatic productivity, Water pollution, Potable water, Waste water disposal, Stratification, Hypolimnion, Oligotrophy.
Identifiers: *South Africa, Batch culture assays, Continuous culture assays, Algal growth rate, Maximum cell concentration, Growth limiting nutrient, Algal growth potential.

The extent of the reduction of the water quality of several dams and rivers in South Africa by cultural eutrophication was studied by means of algal assays based on the assumption that there is a relationship between algal growth and the concentration of the nutrient in shortest supply. Comparison of the batch and continuous culture assay techniques, both of which provide a measure of the concentration of the growth-limiting nutrient, or trophic level, suggests that the former technique be used as a screening procedure and the latter as a more refined tool in eutrophication analyses. Batch assays were used to measure algal growth rates and maximum cell concentration values of 6 rivers and the variation downstream of the point at which one river received effluent from a sewage works. Algal growth potentials of 4 dams were determined, and variations at different sites

within one dam. Batch assay was also used to identify the growth-limiting nutrients of a dam by varying each plant nutrient in turn, and to predict the response of dam water to the addition of specific effluents or of high quality water. Continuous assay culture confirmed the findings of the batch assays. DWA)

ATMOSPHERIC REAERATION CAPACITY OF STREAMS. PART I. CRITICAL REVIEW OF METHODS AVAILABLE TO MEASURE AND TO CALCULATE THE ATMOSPHERIC REAERATION RATE CONSTANT,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Environmental Science.
J. S. Zogorski, and S. D. Faust.
Environmental Letters, Vol 4, No 1, p 35-59, 1973. 2 fig, 2 tab, 36 ref.

Descriptors: *Reaeration, *Atmosphere, *Oxygenation, *Streams, Mathematical models, Measurement, Analytical techniques, Equations, Dissolved oxygen, Forecasting.
Identifiers: *Reaeration rate constant, Reaeration capacity, Predictive models.

Current state of the art of predicting stream atmospheric reaeration rates under natural conditions is critically reviewed. Assumptions, degree of applicability, and general procedure of each model commonly used for aeration capacity prediction are presented. Methods directly measuring atmospheric reaeration include the disturbed equilibrium method, the gasometric method, and the technique of monitoring changes in dissolved oxygen concentrations between two sampling stations. Methods indirectly measuring atmospheric reaeration rate constant are the oxygen sag technique, the diurnal curve analysis, the tracer technique, and numerous empirical equations relating the reaeration rate constant to the stream's physical parameters. Selection of the proper method to measure or to predict the reaeration rate constant for a given situation depends primarily upon the physical characteristics of the river reach under the study. The primary basis of selection should be made on comparison with results obtained from direct measurement of the reaeration rates if possible. If not, then selection should be based on similarities between the physical characteristics of the study basin and those used in development of each predictive equation. Preference should be given to predictive equations either developed solely from field data or developed by laboratory experiments and later verified by field experiments. (See also W74-02917) (Jones-Wisconsin)
W74-02916

ATMOSPHERIC REAERATION CAPACITY OF STREAMS. PART II. DIRECT MEASUREMENT OF THE ATMOSPHERIC REAERATION RATE CONSTANT IN THE UPPER RARITAN RIVER BASIN,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Environmental Science.
J. S. Zogorski, and S. D. Faust.
Environmental Letters, Vol 4, No 1, p 61-85, 1973. 8 fig, 4 tab, 22 ref.

Descriptors: *Atmosphere, *Reaeration, *Measurement, *Streams, Rates, New Jersey, Mathematical studies, Channel morphology, Velocity, Width, Depth, Streamflow, Dissolved oxygen, Statistical methods, Equations.
Identifiers: *Reaeration rate constant, Raritan River (N.J.), Lamington River (N.J.).

The feasibility of using the disturbed equilibrium method, modified by Gameson and Truesdale (J. Inst. Water Eng 13: 175, 1959), in directly measuring the reaeration rate constant was determined and also which, if any, of the empirical predictive equations could be successfully applied in estimating reaeration rate constant. Two study sites, Raritan River and Lamington River, New Jersey, were selected based on channel uniformity and as being representative of the river. To create an oxygen deficit required for measurement, a catalyzed sodium sulfite solution was introduced. To evaluate various empirical equations, the mean velocity and mean depth during each experiment were determined. An additional criterion which must be satisfied when measuring reaeration rate constant values by the Gameson and Truesdale method is that complete horizontal and vertical mixing of the depleted water body must occur before the first sampling station is reached. These reaeration experiments indicate that this method, as modified by Gameson and Truesdale, can be successfully applied to measure the reaeration rate constant directly in small, shallow streams. The predictive equation of Owens, Edwards, and Gibbs (Int. J. Air Water Pollut. 8: 469, 1964), for shallow streams provided the best statistical fit to the reaeration rate constant values. The predictive equation for deep streams yielded the second best fit. (See also W74-02916) (Jones-Wisconsin)

STUDIES ON A SALINE LAKE ECOSYSTEM,
Monash Univ., Clayton (Australia). Dept. of Zoology.
K. F. Walker.
Australian Journal of Marine and Freshwater Research, Vol 24, No 1, p 21-71, 1973. 13 fig, 11 tab, 107 ref.

Descriptors: *Australia, *Biological communities, *Saline lakes, *Chemical properties, Geology, Meteorology, Vegetation, Sediments, Shoreline cover, Lake morphology, Temperature, Energy budget, Mathematical studies, Hydrology, Light, Light penetration, Ions, Hydrogen ion concentration, Conductivity, Nitrogen, Phosphorus, Phytoplankton, Succession, Photosynthesis, Productivity, Salinity, Zooplankton, Benthos, Rotifers, Evaporation, Rainfall, Anabaena, Solar radiation, Bacteria, Cyanophyta, Diptera, Dinoflagellates.
Identifiers: *Lake Werowrap (Victoria).

A detailed study of saline Lake Werowrap is reported. It is one of eight small crater lakes associated with a multiple scoria cone known as Red Rock, near Lake Corangamite, Victoria, Australia. Red Rock lakes have predominantly sodium 'chlorocarbonate' composition. Its tropic structure was taxonomically simple. Anabaena spiroides predominated in summer and autumn 1969, but subsequently was displaced by the dinoflagellate Gymnodinium aeruginosum and a blue-green alga tentatively identified as Chroococcus. Species composition change probably was due to progressive salinity increase. C-14 and oxygen productivity data showed good correspondence only in summer, due to effects of non-photosynthetic respiration. Changes in cell and pigment concentrations also were monitored. Radiation and temperature appeared the most influential factors governing primary productivity. Inorganic nitrogen was the only chemical constituent to show significant depletion. Considerable bacterial activity was indicated by high rates of 'dark' C-14 assimilation. Attention was given to the population dynamics of the rotifer Brachionus plicatilis, the dominant zooplankter, attaining peak densities in summer and autumn. Variations in rotifer population parameters were attributed mainly to salinity, temperature and food supply. Incomplete productivity data suggest that the lake had the most productive benthic community yet recorded. (Jones-Wisconsin)

PHYSIOLOGY AND ULTRASTRUCTURE OF AN OXYGEN-RESISTANT CHLORELLA MUTANT UNDER HETEROTROPHIC CONDITIONS,
Rice Univ., Houston, Tex. Dept. of Biology; and Rice Univ., Houston, Tex. Dept. of Environmental Science and Engineering.
W. M. Pulich, and C. H. Ward.
Plant Physiology, Vol 51, No 2, p 337-344, 1973. 8 fig, 1 tab, 24 ref.

Descriptors: *Plant physiology, *Plant morphology, *Oxygen, *Resistance, *Chlorella, Genetics, Respiration, Photosynthesis, Plant growth, Metabolism, Cultures, Phototropism, Algae.
Identifiers: *Biosynthesis, *Ultrastructure, *Heterotrophy, Chlorella sorokiniana.

Heterotrophic culture of the green algae, Chlorella, represents a useful experimental technique by which regulatory mechanisms can be investigated. Use of this technique to characterize a mutant strain of the high temperature species, C. sorokiniana, is reported. Heterotrophic culture conditions were optimized by testing various parameters, including temperature, gas conditions, and substrates for the proper combination promoting maximum logarithmic growth in the dark. Ultrastructural analysis revealed that osmiophilic deposits are present only in wild type, while the oxygen-resistant strain (ORS) apparently contains increased amounts of starch and endoplasmic reticulum. The ORS requires 6 to 8 days to adapt completely to dark, heterotrophic conditions, whereas the wild type acclimates in 1 day; the ORS is resistant to high oxygen tension only when grown on glucose, but not on acetate; the respiratory rate, but not the photosynthetic rate, of heterotrophic ORS is abnormal compared to the wild type. Electron micrographs of the wild type on air represent typical dark-grown C. sorokiniana. Organelles and fine structure common to Chlorellas and other eukaryotic cells are discernible. ORS on air present several outstanding differences with cells generally more variable in size and shape than the wild type. (Jones-Wisconsin)

POLLUTION OF THE 'EL CARPINCHO' POND (PAMPASIC REGION, ARGENTINA) AND ITS EFFECTS ON PLANKTON AND FISH COMMUNITIES,
La Plata Univ. (Argentina). Estacion Hidrobiologica y Acuario de Berisso.
L. Freyre.
Environmental Pollution, Vol 4, No 1, p 37-40, 1973. 4 tab, 2 ref.

Descriptors: *Water pollution effects, *Rehabilitation, *Plankton, *Fish, Biological communities, South America, Industrial wastes, Magnesium, Calcium, Sodium, Zooplankton, Catfishes, Sulfates, Nitrates, Phosphates, Iron, Lead, Silversides, Eutrophication.
Identifiers: *El Carpincho (Argentina), Pampasic Region (Argentina), Basilichthys bonariensis, Parapimelodus velenciennesi, Diversity index.

In the Southern Pampasic region of Argentina, sport fishing and other recreational activities have been developed in a large pond, the Argentine silver-side being the most favored fish species. Beginning with October 1969 pollution was caused by a milk processing plant, a plastic bag factory and an establishment for washing cattle trucks discharging liquid wastes without treatment into a creek directly connected to the pond. The biological effect on plankton was related to changes in Mg/Ca ratio. The reduced density of zooplankton produced a reduction in numbers of the freshwater Argentine silverside. The catfish, with the same trophic relations as the silverside, is a recent inhabitant of the pond with an explosive population increase; possibly this fish is in the last stage of exponential increase. The diversity index for the relative composition of the fish fauna rose from 0.3093 in 1966 to 1.9384 in 1970. It is proposed to empty the pond entirely by opening the dam to

emove the catfish and eliminate the excess lead nd iron. The rehabilitation of the biotope will then e carried out by refilling the basin. Later the sil-erside and other species can be reintroduced. Jones-Wisconsin)

ITROGEN FIXATION IN LAKE SEDIMENTS: A CONTRIBUTION TO NITROGEN BUDGET OF LAKE MENDOTA,
Visconsin Univ., Madison. Dept. of Soil Science.
. N. Macgregor, D. R. Keeney, and K. L. Chen.
Environmental Letters, Vol 4, No 1, p 21-26, 1973. tab, 14 ref.

Descriptors: *Nitrogen fixation, *Sediments, Lakes, Cycling nutrients, Wisconsin, Denitrification, Ammonia, Oxidation-reduction potential, Gas chromatography.
Identifiers: *Nitrogen budget, *Lake Mendota (Wis), Lake Wingra (Wis), Nitrogenase activity.

Sediments from Lake Mendota and Lake Wingra were examined for nitrogen fixation using the acetylene reduction assay. It has been commonly assumed that sediment nitrogen fixation is biological in origin and attributable to facultative or strictly anaerobic microorganisms of the genus Clostridium. All sediment samples produced between 1 and 2 nanomoles of ethylene per ml of sediment by the end of two days' incubation. Sediment from Lake Mendota incubated at 4C and 20C produced 70% and 114% respectively of the amount of ethylene formed at 10C. Methane formation, however, was significantly influenced by temperature, sediment incubated at 20C showing a 5-fold increase in methane formation over the same sediment incubated at 4C. The capacity of the sediments to reduce acetylene to ethylene appears to be biological and involves the enzyme complex known as nitrogenase. Acetylene reduction rates by lake sediments indicate 5 to 8% of estimated annual contributions of combined nitrogen in Lake Mendota may originate from nitrogen fixation in the top 10 cm of sediment profile. Concurrent denitrification and nitrogen fixation may account for maintenance of ammonium levels in some lake sediments. (Jones-Wisconsin)

THE EFFECT OF ETHYLENEDIAMINETETRAACETIC ACID ON THE GROWTH OF CHLORELLA PYRENOIDOSA AND ITS ROLE IN THE DYNAMICS OF METABOLISM AND ACCESSIBILITY OF IRON AND CALCIUM,
Instytut Zootechniki, Oswiecim (Poland). Samodzielna Pracownia Biologii Ryb i Strodowiska Wodnego.
Zarnowski.
Acta Hydrobiologica, Vol 14, No 4, p 353-373, 1972. 6 fig, 6 tab, 23 ref.

Descriptors: *Cultures, *Chlorella, *Plant growth, Metabolism, *Iron, Calcium, Dynamics, Chemical precipitation, Oxidation, Biomass, Chlorophyll, Algae, Trace elements.
Identifiers: *Ethylenediaminetetraacetic acid, Chlorella pyrenoidosa.

The influence of different components of the medium on the dissolved iron level and the course of hydroxy-reducing reaction of iron were investigated and the role of ethylenediaminetetraacetic acid in the process of iron stabilization, and optimum conditions of its application in the medium determined. Effects of iron concentration, of forms of iron, of the additions of calcium and Fe+EDTA, Ca+EDTA, and Fe+EDTA+Ca complexes on the growth intensity of Chlorella pyrenoidosa were studied. The level of iron, determined using the dipyridyl method, is lowered in the presence of mineral salts, phosphorus compounds being apparently responsible for the iron deficit. Biavalent iron was oxidized to trivalent iron. The level of dissolved iron is favorably affected by ethylenediaminetetraacetic acid. The most intense growth of alga cultures was obtained in the presence of iron chelated with ethylenediaminetetraacetic acid. In Chlorella culture, calcium added did not bring about any change in growth intensity. The pH values decreased with addition of EDTA depending on EDTA concentration. No great differences in growth intensity of Chlorella were found between the combinations with free EDTA and with the form of Fe+EDTA+microelements complex. (Jones-Wisconsin)

PLANKTON DYNAMICS IN A NEWFOUNDLAND LAKE,
Memorial Univ. of Newfoundland, St. John's. Dept. of Biology.
C. C. Davis.
Verhandlungen Internationale Vereinigung Limnologie, Vol 18, p 278-283, 1972. 3 fig, 7 ref.

Descriptors: *Plankton, *Dynamics, *Lakes, Nannoplankton, Phytoplankton, Zooplankton, Coliforms, Septic tanks, Cyanophyta, Copepods, Crustaceans, Daphnia, Diatoms, Ice cover, Anabaena, Chrysophyta, Rotifers, Protozoa.
Identifiers: *Newfoundland, *Hogan's Pond (Newfoundland), Diaptomus minutus, Daphnia catawba, Holopedium gibberum, Epischura nordenskioldi, Asterionella formosa, Tabellaria fenestrata, Uroglenopsis americana, Chrysosphaerella longispina, Sphaerocystis, Schroederia, Anabaena flos-aquae, Cyclops scutifer, Conochilus unicornis, Kellicottia longispina, Keratella cochlearis, Vorticella, Epistylis, Actinosphaerium, Dinobryon bavaricum.

To record plankton of the lakes of the little studied island of Newfoundland, samples were taken at 0, 2, 5, and 9 m every two weeks for 17 consecutive months at Hogan's Pond, about 15 km from St. John's (Avalon Peninsula). Hogan's Pond, relatively undisturbed by man, has no permanent inlets, water coming mainly from springs. There are 25 habitations around the shore, probably used as summer cottages. Coliform counts suggest there is very little direct pollution, but undoubtedly there has been substantial enrichment from septic tank seepage. The winter and spring phytoplankton was dominated by diatoms, Tabellaria fenestrata and Asterionella formosa being the most abundant. In June and July 1970, dominance of the phytoplankton by Tabellaria fenestrata was shared by Uroglenopsis americana, Chrysosphaerella longispina, Sphaerocystis, Schroederia, and Anabaena flos-aquae. In both autumns blue-green algae were dominant, with Microcystis aeruginosa being more abundant than Anabaena flos-aquae. In November and December 1969, the chrysophyte Dinobryon bavaricum attained dominant status, along with Tabellaria fenestrata. Plankton quantity in Hogan's Pond was low. Although it may be somewhat enriched compared to many other Newfoundland and boreal lakes, it can hardly be classified as eutrophic. (Jones-Wisconsin)

ASSOCIATED ORGANELLES IN THE BLUE-GREEN ALGA, ANACYSTIS NIDULANS,
Ohio State Univ., Columbus. Dept. of Microbiology.
W. C. Dierksheide, and R. M. Pfister.
Canadian Journal of Microbiology, Vol 19, No 1, p 149-157, 1973. 1 fig, 10 ref.

Descriptors: *Algae, *Cyanophyta, *Biochemistry, *Cytological studies, Plant morphology, Phosphates, Granules.
Identifiers: Organelles, Anacystis nidulans.

During observations of Anacystis nidulans, electron-dense polyphosphate granules were seen in close proximity to cyanophycin material. The cyanophycin granules are sometimes referred to as lamellasomes. It is believed that these granules act as a reserve for inorganic phosphate when nuclear synthesis has been interfered with. They appear as electron-dense bodies within the cytoplasm of the cell. Evidence is presented to show the association between polyphosphate granules and cyanophycin granules, and to suggest a functional relationship. In the electron microscope, longitudial sections of A. nidulans show, in addition to the layers of the cell wall and the plasma membrane, cell inclusions. Near the developing septum of the cell is a cyanophycin granule formed by series of concentric shells of membranes. Similar membranous structures can be seen surrounding polyphosphate granules. The formation of the polyphosphate granule in A. nidulans is envisioned to occur via the deposition of phosphate within the cyanophycin granule. The resulting porous body becomes electron-dense as phosphate deposition continues. The proximity of these inclusions strongly suggests that cyanophycin participates in the synthesis of polymeric phosphate. (Jones-Wisconsin)
W74-02927

EFFECT OF NITRITE AND NITRATE ON CHLOROPHYLL FLUORESCENCE IN GREEN ALGAE,
Florida State Univ., Tallahassee. Inst. of Molecular Biophysics.
E. Kessler, and W. G. Zumft.
Planta (Berl), Vol 111, No 1, p 41-46, 1973. 2 fig, 17 ref.

Descriptors: *Biochemistry, *Nitrites, *Photosynthesis, *Nitrates, *Fluorescence, Chlorophyta, Oxidation-reduction potential, Chlorella, Algae.
Identifiers: Ankistrodesmus braunii, Electron transport.

Photosynthetic reduction of nitrite was found in intact green algal cells and other organisms and observed in cell-free systems containing chloroplast fragments, ferredoxin, and nitrite reductase. Nitrate is not reduced photosynthetically in whole green algal cells in the absence of carbon dioxide. A light-dependent reduction of nitrate has been found in reconstituted systems with chloroplast fragments, FMN or ferredoxin, and nitrate reductase. Chlorophyll fluorescence is one of the most sensitive indicators for the redox state of the primary acceptor of photosystem II of photosynthesis. The influence of nitrite and nitrate on algal fluorescence was studied for more evidence concerning relation in vivo of nitrite and nitrate reduction to the photosynthetic electron transport system. Two forms of Chlorella vulgaris were used and compared with C. fusca and Ankistrodesmus braunii. In phosphate solution under an atmosphere of nitrogen, fluorescence shows a pronounced induction and rises to a high steady-state level. In the presence of nitrite, fluorescence decreases after a short induction peak to a much lower steady-state. Nitrate does not influence either induction or steady-state of fluorescence. Nitrite reduction in light is closely coupled to the photosynthetic electron transport system, whereas nitrate is not reduced photosynthetically in vivo. (Jones-Wisconsin)
W74-02928

THE APPEARANCE OF NITRATE REDUCTASE ACTIVITY IN NITROGEN-STARVED CELLS OF ANKISTRODESMUS BRAUNII,
University Coll. of Swansea (Wales). Dept. of Botany.
P. J. Syrett, and C. R. Hipkin.
Planta (Berl), Vol III, No 1, p 57-64, 1973. 4 fig, 2 tab, 12 ref.

Descriptors: *Cytological studies, *Nitrates, *Enzymes, *Nitrification, Nitrogen, Ammonia, Nitrites, Chlorella, Algae.
Identifiers: *Ankistrodesmus braunii.

The suggestion that nitrification occurs in cells of nitrogen-deficient algae is not substantiated. Neither does the formation of nitrate reductase by such algae appear to be a response to nitrate or chlorate present as impurities in the medium. In algae such as Chlorella and Ankistrodesmus synthesis of nitrate reductase is repressed by ammonium. When this repression is removed nitrate reductase is synthesized. The presence of nitrate or nitrite is not essential for this synthesis to occur although the rate of synthesis is stimulated when nitrate is added. This view is supported from the observations that Ankistrodesmus grown with nitrogen sources such as urea or glycine contains substantial quantities of nitrate reductase activity. Nitrate reductase activity was detectable in ammonium-grown cells of Ankistrodesmus braunii after 50 minutes of nitrogen starvation. The rate of formation of nitrate reductase was stimulated by addition of nitrate and inhibited completely by cycloheximide. Nitrogen-starved cells assimilated added nitrate or nitrite rapidly and no nitrite or nitrate was detectable in either cells or culture medium from cultures subject to nitrogen starvation. It is concluded that nitrate is not obligatory for the formation of nitrate reductase. (Jones-Wisconsin)

PRELIMINARY REPORT ON SIMULATED PASSAGE EFFECT OF POTENTIAL COLONIZING PROTOZOANS THROUGH CONDENSER OF A STEAM ELECTRIC POWER GENERATING PLANT UPON DOWNSTREAM PROTOZOAN COMMUNITY DEVELOPMENT,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
E. D. Lorton, and J. Cairns, Jr.
Rev Biol (Lisb). Vol 7, No 3/4, p 215-227. 1970/1971. Illus.
Identifiers: *Colonizing protozoans, Density, *Electric power plants, *Protozoans, *Simulated passage, Steam condensers, Thermal pollution.

The purpose was to simulate the passage of water containing protozoans through the condensers of a steam electric power station in order to determine the effects upon colonization of downstream communities. Water was pumped from a reservoir unit (containing dechlorinated tap water, mud, plants, microorganisms, invertebrates, and fish) through a copper coil immersed in a hot water bath, to produce a 16-26C increase in temperature. The water then flowed into a cold water bath returning it to its original temperature. The water was then directed into 3 Plexiglas troughs 79 cm long, 5 cm wide, and 7.5 cm high, before it fell over an end plate 4 cm high back into the reservoir unit. Two control troughs were maintained in an identical manner except for the heat shock. The 5 communities were sampled weekly for 7 wk, and records of diversity (i.e. number of species) in each community and estimates of population density of 6 species were made. The experiment ran for 7 wk. No differences in diversity were observed between control and experimental communities. The results of the density studies were inconclusive probably because data were obtained for too few species.--Copyright 1973, Biological Abstracts, Inc.

THE OCCURRENCE OF HETEROTROPHIC BACTERIA IN THE WATERS OF THE ILAWA LAKES AND SOME OF THEIR PHYSIOLOGICAL AND BIOCHEMICAL PROPERTIES,
Wyzsza Szkola Rolnicza, Olsztyn-Kortowo (Poland).i. Instytut Inzynierii i Biotechnologii Zywnosci.
S. Niewolak.
Acta Hydrobiologica, Vol 14, No 4, p 331-351, 1972. 3 fig, 9 tab, 26 ref.

Descriptors: *Bacteria, *Lakes, *Plant physiology, *Biochemistry, Dairy industries, Pseudomonas, E. coli, Nitrogen, Carbon, Water pollution effects, Pigments, Systematics, Bioindicators.
Identifiers: *Heterotrophic bacteria, *Ilawa Lakes (Poland), Micrococcus candidus, Lake Jeziorak Maly (Poland), Lake Jeziorak (Poland), Micrococcus caseolyticus, Micrococcus freudenreichii, Pseudomonas aeruginosa, Pseudomonas syncyanea, Pseudomonas synxantha, Pseudomonas pavonacea, Bacillus.

On the basis of qualitative composition of bacteria in lake water, type of water body and kind of pollution may be determined. Changes of qualitative composition of heterotrophic bacteria of Ilawa Lakes. Poland and some physiological and biochemical properties were studied. Investigations were carried out on Jeziorak Maly (sewage reservoir) and Jeziorak (eutrophic lake) in the western Mazurian Lake District. Considerable variability was noted in seasonal occurrence of bacteria decomposing various nitrogen compounds in both lakes. The occurrence of bacteria decomposing various carbon compounds is often correlated with the seasonal factor. Of the genus Micrococcus, greater quantities occur in Lake Jeziorak Maly than in Lake Jeziorak. Among them are M. candidus, M. caseolyticus, M. freudenreichii, and others from dairy wastes. The occurrence of Pseudomonas aeruginosa, P. syncyanea, P synxantha, P. pavonacea, and Escherichia coli indicate the sewage character of this reservoir. Bacteria of the genus Bacillus (33-38%) dominate in Lake Jeziorak. Among the microorganisms isolated from Lake Jeziorak there were many strains of bacteria decomposing various forms of nitrogen and carbon and lesser numbers in Lake Jeziorak Maly. (Jones-Wisconsin)

EFFECT OF PH AND HIGH PHOSPHORUS CONCENTRATIONS ON GROWTH OF WATERHYACINTH,
Florida Univ., Fort Lauderdale. Agricultural Research Center.
W. T. Haller, and D. L. Sutton.
Hyacinth Control Journal, Vol 11, p 59-61, 1973. 3 tab, 17 ref.

Descriptors: *Nutrient removal, *Hydrogen ion concentration, *Phosphorus, *Water hyacinth, Plant morphology, Plant growth, Absorption.

In a study of nutrient removal by waterhyacinth, 1.0 ha of waterhyacinth was estimated to be capable of removing from water the annual nitrogen and phosphorus output of slightly over 800 people. The pH effects on productivity of waterhyacinths were evaluated, maximum amount of phosphorus absorbed measured, and distribution of the absorbed phosphorus in the plants determined. Waterhyacinth grew over a pH range of 4.0 to 10.0 which includes most natural bodies of water. Waterhyacinth growth determined by dry weight was higher when grown in a medium of 20 ppm phosphorus than when grown in 0, 5, 10, or 40 ppm concentration; concentrations higher than 40 ppm were toxic. Separation of plants into leaves, stems, and roots shows that weights of leaves and stems followed a pattern of growth similar to the whole plant. High phosphorus absorption, complemented with the high productivity of waterhyacinth, indicates waterhyacinth plants could be beneficial in removing large amounts of nutrients from etrophic waters by mechanical harvesting. Although cost of mechanically harvesting waterhyacinth is prohibitive, it would be worthwhile to know the value of removing nutreients from water and then including this value in determining the economic feasibility of the operation. WATER QUALITY CRITERIA FOR EUROPEAN FRESHWATER FISH. REOPRT ON AMMONIA AND INLAND FISHERIES.
Food and Agriculture Organization of the United Nations Rome (Italy). European Inland Fisheries Advisory Commission.

Water Research, Vol 7, No 7, p 1011-1022, July 1973. 2 fig, 2 tab, 51 ref.

Descriptors: *Water quality standards, *Ammonia, *Freshwater fish, *Toxicity, *Water temperature, *Hydrogen ion concentration, Water pollution sources, Water pollution effects, Sewage effluents, Industrial wastes, Farm wastes, Reviews, Resistance, Carbon dioxide, Dissolved oxygen, Hardness (Water), Alkalinity, Salinity, Rainbow trout, Minnows, Salmon, Brown trout, Eggs, Atlantic salmon, Perches, Carp, Sunfishes, Sticklebacks, Waterfleas.
Identifiers: Chronic tests, Chubs, Mosquitofish, Threshold concentrations, Roach, Rudd, Bream, Tench, Crucian carp.

The purpose of this review is to summarize the state of knowledge on the effect of ammonia on fish, to determine whether firm criteria can be established, and to indicate areas where further research is required. Data were primarily from European sources. The survey shows that sewage effluent and effluents from certain industries and from agriculture are common sources of ammonia in water. Of the parameters investigated (pH, CO2, DO, hardness, alkalinity, temperature, and salinity), it is found that the harmful effects of ammonia on fish were related to the pH value and the temperature of the water due to the fact that only the un-ionized fraction of ammonia is posonous. The un-ionized fraction increases with rising pH value, and with rising temperature. Fish differ slightly in their tolerance to ammonia depending on species. The difference in tolerance is more significant for short periods of exposure. The difference in tolerance is, however, not great enough to justify different criteria for different species. The lowest toxic concentration found for salmonids is 0.2 mg NH3/l (un-ionized), but other adverse effects caused by prolonged exposure are only absent at concentrations lower than 0.025 mg NH3/l (un-ionized). Concentrations of total ammonia which contain this amount of un-ionized ammonia vary from 19.6 mg/l (pH 7.0, 5 C) to 0.1 mg/l (pH 8.5, 30 C). The criterion should not be applied to temperatures below 5 C or to pH values above 8.5 when other factors have to be taken into consideration. (Little-Battelle)

ON THE SYSTEMATICS AND ECOLOGY OF THE GENUS CHAMESIPHON (CYANOPHYCEAE). 2. ECOLOGY (ZUR SYSTEMATIK UND OKOLOGIE DET GATTUNG CHAMESIPHON (CYANOPHYCEAE) 2. OKOLOGIE),
Biological Station, Lunz am See (Austria).
E. Kann.
Archiv fur Hydrobiologie, Suppl. 41 (Algological Studies 8), p 243-282, June 1973.

Descriptors: *Cyanophyta, *Aquatic algae, *Ecology, *Systematics, *Environmental effects, Speciation, Dominant organisms, Water quality, Aquatic habitats, Resistance, Ecological distribution, Aquatic plants, Water chemistry, Water temperature, Running waters.
Identifiers: *Chamaesiphon, Species abundance, Substrates, Chamaesiphon incrustans, Chamaesiphon confervicola, Chamaesiphon confervicola var. elongata, Chamaesiphon sub

globosus, Chamaesiphon rostafinskii, Chamaesiphon polonicus, Chamaesiphon geitleri, Chamaesiphon fuscus, Chamaesiphon oncobyrsoides, Chamaesiphon pseudopolymorphus, Chamaesiphon polymorphus, Chamaesiphon investiens var. roseus, Chamaesiphon niger, Chamaesiphon starmachii.

A compilation of the ecological factors governing the occurrence of the Chamaesiphon species investigated clearly reveals the environmental requirements of the abundant species, those of less frequently occurring species are accordingly more obscure. Chamaesiphon is a predominantly running water form, although some species grow exclusively on inanimate surfaces (stones, glass, plastics), while others grow only on living substrates (algae, aquatic plants). Few occur on both types. In general, the species have a wide temperature tolerance; only a few (Ch. geitleri, Ch. fuscus, Ch. rostafinskii) appear to prefer running water of constanlty low temperatures (i.e., also in summer). A similarly wide tolerance is displayed for the chemical quality of the water. With two exceptions, the Chamaesiphon species thrive equally well in calcium-rich water as in calcium-poor water, although some species are significantly more abundant in the former. It appears from previous investigations that Ch. fuscus is a Ca-poor water form and that Ch. geitleri perfers Ca-rich water. Only a small amount of data exists on the role played by the trophic level of the water body. The available data indicate that Chamaesiphon species grow best in unpolluted water, although some can tolerate polluted conditions. Ch. polymorphus is the only species which has been found growing in polysaprobic water. (Holoman-Battelle)

THE INFLUENCE OF EUTROPHIC LAKE SEDIMENTS ON THE GROWTH OF DIFFERENT PLANKTONIC ALGAE,
California Univ., Davis. Dept. of Zoology.
P. Javornicky, D. K. Fujita, and C. R. Goldman.
Archiv fur Hydrobiologie, Suppl. 41 (Algological Studies 8), p 341-362, June 1973. 7 fig, 4 tab, 41 ref.

Descriptors: *Nutrient requirements, Growth rates, *Diatoms, *Cyanophyta, *Chlorophyta, *Bioassay, Sediments, On-site tests, Phosphates, Iron, Nitrates, Essential nutrients, Calcium, Magnesium, Carbonates, Primary productivity, *Eutrophication, Dominant organisms, Silicates, *California, *Lake sediments.
Identifiers: *Clear Lake (CALIF), In vitro tests, In situ tests, Culture media.

In order to assess the effect of substances leached from sediments on the production of phytoplankton in a large, shallow, eutrophic lake (Clear Lake, California), one in situ experiment and four laboratory bioassays were conducted. The field experiment showed the effects of sediments on various species or groups of algae to differ: the presence of sediment inhibited the growth of Anabaena flos-aquae and A. circinalis while it stimulated the growth of Chlorococcales. In vitro bioassays were conducted with seven algal strains, Aphanizomenon flos-aquae, Microcystis aeruginosa, Oscillatoria limnetica, Nitzschia kuetzingiana, Navicula pelliculosa, Chlorella minutissima, and Scenedesmus intermedius, in 50-ml flasks containing sediment extract, a synthetic imitation of sediment extract, enriched (Ca, Mg, CO3, Si03) extract, or enriched imitation. Aphanizomenon and Chlorella grew well in the sediment and synthetic extracts for 200 hours which demonstrated that the cells were able to store required nutrients that were missing from the synthetic extract. This test also showed that the chelating effect of EDTA and citric acid used in the synthetic extract was similar to that of the humic substances in the sediment extract. The results with the enriched extracts led to the following conclusions: (1) Growth of Aphanizomenon is definitely limited by Fe and probably by P. (2) Growth of Microcystis and Oscillatoria is definitely limited by N and possibly by P. (3) Growth of Nitzschia is definitely limited by N and probably by P, Fe and Si. (4) Growth of Navicula is definitely limited by N and possibly by P. (5) Growth of Chlorella is definitely limited by N and Fe. (6) Growth of Scenedesmus is definitely limited by Fe, probably by N and possibly by P. Little-Battelle)

SULFUR AND THE TOXICITY OF THE RED ALGA CERAMIUM RUBRUM TO BACILLUS SUBTILIS,
New Hampshire Univ., Durham. Dept. of Biochemistry.
M. Ikawa, V. M. Thomas, Jr., L. J. Buclkey, and J. J. Uebel.
Journal of Phycology, Vol 9, No 3, p 302-304, September 1973. 2 tab, 9 ref.

Descriptors: *Rhodophyta, *Algal toxins, *Sulfur, *Inhabition, *Growth rates, Marine algae, Bacteria, Toxicity, Isolation, Sulfur compounds.
Identifiers: *Bacillus subtilis, *Ceramium rubrum, Sample preparation, Thin layer chromatography.

In an investigation of the antibiotic activity of algae, the red alga Ceramium rubrum showed the greatest growth inhibitory activity against B. subtilits. Quantities of C. rubrum were collected and assayed to determine the nature of the inhibitory substance. The algae were washed, blotted, and allowed to air dry at room temperature. The dried algae were ground, extracted with benzene for 4-5 days in a Soxhlet extractor, and dried in vacuo to yeild the crude active extract. The crude extract was dissolved in chloroform and chromatographed to yield an active fraction which was prepared for further identification by thin-layer chromatography. Crystalline sulfur was the inhibitory substance isolated from the red seaweed. This alga was unusual in that it contained a much higher free sulfur content than other red and brown algae tested. (Holoman-Battelle)

CELL YIELD AND GROWTH RATE IN ACTIVATED SLUDGE,
Cornell Univ., Ithaca, N.Y. School of Civil and Environmental Engineering.
J. H. Sherrard, and E. D. Schroeder.
Journal Water Pollution Control Federation, Vol 45, No 9, p 1889-1897, September 1973. 8 fig, 2 tab, 12 ref.

Descriptors: *Activated sludge, *Kinetics, *Growth rates, *Laboratory tests, *Biological treatment, Nutrient removal, Inorganic compounds, Efficiencies, Biochemical oxygen demand, Waste treatment, Nutrients, Cultures.
Identifiers: *Cell yield, *Sewage microorganisms, *Residence time, Substrate utilization, Mixed liquors, Continuous flow system, Data interpretation, Culturing techniques.

A laboratory study of the completely mixed ac tivated sludge process showed that the observed cell yield coefficient corresponding to each value of sludge age or mean cell residence time is a conceptually and practically significant parameter. At low cell residence times, low mixed liquor suspended solids, high sludge production, and high removal of inorganic nutrients may be expected, while long residence times lead to high mixed liquor suspended solids, low sludge production, and low inorganic nutrient removal. Removal of biochemical oxygen demand is nearly constant under both conditions. (Holoman-Battelle)

A PROCEDURE FOR SHORT-TERM BIOASSAY TESTS ON INDUSTRIAL EFFLUENTS OF LOW OXYGEN CONTENT,
Lakehead Univ., Thunder Bay (Ontario). Dept. of Biology.
G. Ozburn, J. Kraft, and L. Somppi.
Canadian Journal of Zoology, Vol 51, No 7, p 794-795, July 1973. 1 fig, 7 ref.

Descriptors: *Bioassay, Methodology, *Oxygenation, *Industrial wastes, *Oxygen sag, *Toxins, *Volatility, *Effluents, Toxicity, *Rainbow trout, Lethal limit, Dissolved oxygen, Laboratory tests, Water pollution effects, Pulp wastes.
Identifiers: Salmo gairdneri.

In a newly developed bioassay procedure concerned with the toxicity of industrial effluents with a low dissolved oxygen content, oxygenation was achieved using a pressurized oxygen supply and polyethylene bags. This method greatly reduces the possibility of stripping volatile toxins within the effluent. The decrease in toxicity that occurs if a sample is aerated with a bubbler before testing can be clearly shown with this method. The procedure has been used to determine the 96-hr LC sub 50 of a bleached kraft mill effluent for rainbow trout. (Holoman-Battelle)

SURVIVAL OF BACTERIA IN EXTREME ENVIRONMENTS,
Indiana Univ., Bloomington.
R. L. Weiss.
Available from University Microfilms, Inc., Ann Arbor, Mich. 48106. Order No. 73-2765. Ph D Dissertation, 1972. 235 p.

Descriptors: *Sulfur bacteria, *Thermophilic bacteria, *Cytological studies, *Hot springs, Acidic soils, Acidic water, Thermal springs, Organic compounds, Electron microscopy, Water temperature, Hydrogen ion concentration, Domonant organisms, Sulfur, Aquatic habitats, Isolation, Aquatic environment.
Identifiers: *Survival, *Sulfolobus acidocaldarius, *Characterization, Cell wall, Chemical composition, Bacterial physiology, Scanning electron microscopy, Fluorescent microscopy.

Sulfolobus acidocaldarius is a newly described species of sulfur oxidizing bacteria able to live at low pH and high temperature. The organism is also characterized by facultative autotrophic growth on sulfur or simple organic compounds and a subunit cell wall lacking peptidoglycan. In nature Sulfolobus was found to exist at temperatures from 60-94C and at pH values from 1.6-3. The temperature optimum for growth was 70-75C; whereas the pH optimum for C-14-glutamate uptake was from 2-4. Survival and growth of Sulfolobus in extreme conditions were demonstrated by slide immersion studies and electron microscopy of natural samples taken at pH 2-3 and 75C. These studies showed that in addition to Sulfolobus, two groups of rod shaped bacteria exist at 75C. These are distinguished from Sulfolobus by their morphology and cell wall structure. Electron microscopic studies showed that in flowing habitats with deposits of elemental S cells were enriched with thin filamentous appendages known as pili. These were not found on cells from bubbling pools containing S crystals, suggesting that the possession of filaments is a response to the physical flow of the habitat rather than the presence of S. The results of laboratory experiments suggest a role of filament in the attachment of cells to S. This attachment was observed directly by fluorescent and scanning electron microscopy. Additional studies were carried out on the cell envelope to determine the biochemical nature of the unusual cell

wall structure. These studies demonstrated a lipoprotein and a highly charged cell wall with a high proportion of hydrophobic amino acids. Conceivably such a structure could contricute to the survival of Sulfolobus in extremes of temperature and pH. (Holoman-Battelle)

EXPERIMENTAL ECOLOGICAL INVESTIGATIONS OF CHIRONOMUS THUMMI AND CHIRONOMUS PIGER (DIPTERA, CHIRONOMIDAE). (EXPERIMENTELL--OKOLOGISHE UNTERSUCHUNGEN AN CHIRONOMUS THUMMI UND CHIRONOMUS PIGER (DIPTERA, CHIRONOMIDAE),
Max-Planck-Institut fuer Limnologie zu Ploen (West Germany). Dept of Tropical Ecology.
B. W. Scharf.
Archiv fur Hydrobiologie, Vol 72, No 2, p 225-244, July 1973. 10 fig, 4 tab, 28 ref.

Descriptors: *Diptera, *Cold resistance, *Dissolved oxygen, *Heat resistance, Growth rates, Water temperature, Growth stages, Water quality, Physiological ecology.
Identifiers: Chironomus piger, Chironomus thummi, Chironomus pulcher, Macroinvertebrates.

In the year 1956 the species Chironomus thummi was divided into two sub-species, which in 1972 were elevated to species: C. thummi and C. piger. In this work the ecological differences between the species in relation to temperature and oxygen pressures were investigated. Differences were found in the resistance to cold, and the duration of development at different temperatures and at various oxygen pressures. The larvae of C. piger are more resistant to cold than those of C. thummi which is in accord with what is known from natural conditions. The African C. pulcher is less resistant than C. thummi. No significant differences in the heat resistance and the preferred temperature of the two species could be found. At 10 and 15C the embryos of C. thummi develop more slowly than those of C. piger, but the development from egg to image occurs quicker in C. thummi. The observation that the larvae of C. thummi are more resistant to anaerobic conditions than those of C. piger can be confirmed by means of the rearing under diminished oxygen pressures. E. Gverin-Dumartrait, J. C. Leclerc, and J. Hoarau.
Archive fur Hydrobiologie, Suppl 39 (Algological Studies 8), p 317-332, June 1973. 1 fig, 3 tab, 23 ref.

Descriptors: *Plant pigments, *Deficient elements, *Light quality, *Photosynthetic oxygen, Nitrogen, Rhodophyta, Chlorophyll, Cultures, Environmental effects, Photosynthesis, Aquatic algae, Limiting factors, Radiation.
Identifiers: *Porphyridium, Culture media, Chlorophyll a, Phycoerythrin, Absorption spectra, Phycocyanin, Culturing techniques, Oxygen evolution.

Porphyridium sp. Lewin/Bloom. 637, was grown at 8500 ergs/sq cm/s intensity in red light (654 nm) or in white light. It has been verified that algae cultivated in this white light, giving a large proportion of green and yellow radiations, show the same pigment composition and photosynthetic 02 evolution as algae cultivated in green light. Inoculum was either synchronized cells or cells previously deprived in nitrogen (effects of light being studied during the starvation removal). Nitrogen starvation includes a rapid dropping of the phycoerythrin/chlorophyll (Per/Chl) quantitative ratio caused by the fall of the Per content. Photosynthetic activities are reduced but remaining Per forms are still active for the energy transfer to Chl a. Refeeding gives a rapid increase of pigment contents, specially for the Per. When grown in red light, after previous starvation or not, Porphyridium cells show comparatively with white light cells a net lowerin of the Chl content without important changes in Per content (counter complementary chromatic adaptation). Absorption spectra of algae measured at -196C reveal three main forms of Chl a: Ca670, Ca677 and Ca683. In red light, the Ca683/Ca677 ratio is decreased while the Ca670/Ca677 is slightly increased. Measurements of photosynthetic 02 evolution indicate that in red light cells of low Chl content, efficiency of Chl for 664 nm radiations is increased. Efficiencies of Per and Chl for green (547 nm) radiations are little affected. (Holoman-Battelle)

THE EFFECT OF PH, C02-CONCENTRATION AND BACTERIA ON THE GROWTH OF THE BLUE-GREEN ALGA OSCILLATORIA REDEKEI VAN GOOR (EINFLUSS VON PH, C02-KONZENTRATION UND BAKTERIEN AUF DAS WACHSIUM DER BLAUALGE OSCILLATORIA REDEKEI VAN GOOR),
Max-Planck-Institut fuer Limnologie zu Ploen (West Germany).
M. E. Meffert.
Archiv fur Hydrobiologie, Vol 72, No 2, p 186-201, July 1973. 5 fig, 32 ref.

Descriptors: *Hydrogen ion concentration, *Carbon dioxide, *Photosynthesis, *Nutrient requirements, *Bioassay, *Growth rates, Cultures, Essential nutrients, Turbulence, Aeration, Bacteria, Resistance.
Identifiers: *Oscillatoria redeki, *Germany (Lake Edeberg), Autolysis.

Axenic and non-axenic suspensions of Oscillatoria redekei van Goor were cultivated to observe the effects of (1) deficiency of C02, (2) C02 at different pH values, and (3) bacteria. In axenic suspensions, decreases of C02 and Ph values above 10 caused extensive fragmentation and autolysis, most of the trichomes being destroyed. In non-axenic suspensions, fragmentation and autolysis were not so serious, so that the trichomes growth continued. At pH values between 7-10, growth of axenic cultures without fragmentation and autolysis was only possible in the range of pH 9. Trichomes of non-axenic suspensions showed a larger range of growth. Measurements from Lake Edeberg show that growth rate and trichome length (cells/trichome) correlate better with the free C02-concentration than with other parameters. The results suggest that O. redekei fixes C02 and not bicarbonate ion even though it can tolerate only low concentrations of free C02. Lakes rich in bicarbonate and carbonate are typical biotopes of blue-green algae since pH values are high and C02 levels are low. The disappearance of these algae may result from extensive turbulence which lowers pH and increases C02 in the epilimnion. Aeration of lakes to remove phosphorus therefore may have the secondary effect of eliminating blue-green algae. Since algae growth increase and autolysis was limited in the presence of bacteria under optimal conditions and athigh C02 levels, the 'C02-effect' of bacteria presented by Lange is not valid for O. redeki. (Little-Battelle)

UPTAKE OF FLOURIDE BY WATER HYACINTH, EICHHORNIA CRISSIPES,
Geological Survey of India, Hyderabad. Southern Regional Chemical Lab.
K. V. Rao, A. K. Khandekar, and D. Vaidyanadham.
Indian Journal of Experimental Biology, Vol 11, No 1, p 68-69, January 1973. 2 tab, 8 ref.

Descriptors: *Fluorides, *Water hyacinth, *Bioassay, Absorption, Calcium, Magnesium, Sodium, Potassium, Manganese, Iron, Cobalt, Nickel, Titanium, Copper, Lead, Zinc, Phosphorus, Heavy metals.
Identifiers: *Bioaccumulation, *Biological magnification, Removal, Biological samples.

Water hyacinths (Eichornia crassipes) which are known to act as scavengers, were collected from the Hussain Sagar tank in Hyderabad, India, and analyzed for fluoride and other trace elements (Ca, Mg, Na, K, Mn, Fe, Co, Ni, Ti, Cu, Pb, Zn, P) to evaluate the potential usefulness of this plant for removing fluorides from water. The fluoride concentration was 25 ppm in leaves and 60 ppm in petioles for a background concentration of 1 ppm in the tank. To further investigate water hyacinth as a fluoride scavenger, plants were exposed up to 26 days to concentrations of 0, 5, 10, 15, 20, and 25 ppm fluoride and analyzed for fluoride content. Uptake ranged from 11 to 75 mg in the course of 4 weeks. Since uptake was appreciable only at higher concentrations (greater than 10 ppm), water hyacinth is unsuitable for defluoridation since levels in natural waters are generally below this level. (Little-Battelle)
W74-02970

PATTERNS OF RADIOCARBON UPTAKE BY A THERMOPHILIC BLUE-GREEN ALGA UNDER VARYING CONDITIONS OF INCUBATION,
Queens Coll., Flushing, N.Y. Dept. of Biology.
J. A. Sperling, and M. H. Geraldine.
Limnology and Oceanography, Vol 18, No 4, p 658-662, July 1973. 2 fig, 1 tab, 4 ref.

Descriptors: *Bioassay, *Primary productivity, *On-site tests, *Cyanophyta, Photosynthesis, Radioactivity techniques, Model studies, Cultures.
Identifiers: *In vitro tests, Mastigocladus laminosus, *Thermophilic algae.

In vitro and fast (40 cm/sec), and slow (1/3 cm/sec) flow in situ methods of sampling were compared by measuring the primary productivity of Mastigocladus laminosus Cohn using each procedure. Current effect and the mechanics of in vitro incubation were distinguished by comparing the distributions of radioactivity within the cores. Thick (4.5-4.6 mm) and thin (10-1.5 mm) mats were grown on styrofoam in aquaria and transferred to a laboratory stream model for in situ tests. For in vitro tests, samples were taken with a steel cork borer, placed in 20-ml screwcap vials, and the vials placed in the stream model. C-14-labeled NaHC03 was introduced into the stream and samples taken for radioactivity counts after 3 and 9 hours. The data suggest that the in vitro technique for determining radiocarbon primary productivity of thermophilic algae that form gelatinous mats is justified, whether the cores by thick or thin, when the core is composed entirely of algae free from bacteria or substratum. Under these conditions the total uptake of in vitro incubations approaches that of in situ incubations. Where cores are bounded by bacteria or substratum, estimates of primary productivity may be underrated by the in vitro technique. (Little-Battelle)

EFFECTS OF DIELDRIN ON BROWN TROUT IN FIELD AND LABORATORY STUDIES,
Otago Univ., Dunedin (New Zealand).Medical School.
J. C. Dacre, and D. Scott.

New Zealand Journal of Marine and Freshwater Research, Vol 7, No 3, p 235-246, September 1973. 2 fig, 11 tab, 20 ref.

Descriptors: *Brown trout, *Water pollution effects, *Dieldrin, *Pesticide toxicity, *Benthic fauna, *Pesticide residues, On-site investigations, Laboratory tests, Bioassay, Lethal limit, Freshwater fish, Chlorinated hydrocarbon pesticides, Aquatic animals, Insecticides, Bottom sampling, Electro-fishing, Pollutant identification, Chemical analysis, Fishkill, Aquatic insects, Diptera, Water beetles, Invertebrates, Mayflies, Caddisflies, Midges, Crustaceans, Oligochaetes, Annelids.
Identifiers: Median tolerance limit, Animal tissues, Bioaccumulation, Salmo trutta, Muscle, Brain, Liver, Silver Stream, Gas liquid chromatography, Chironomids, Deleatidium spp, Riffle beetles, Black flies, Crane flies, Paracalliope, Pycnocentria evecta, Psilochorema bidens, Hydrobiosis umbripennis, Austrosimulium laticorne.

Fifty-five liters of dieldrin spray were accidentally discharged into the Silver Stream, a tributary of the Taieri River, Otago, New Zealand, in September 1963. All the brown trout (Salmo trutta) in the lower portion of the stream were killed. A quantitative survey was not carried out until January 1964, and some repopulation was noted. The bottom fauna was sampled 7 days after the release of dieldrin. Statistical analyses of the data showed no significant effect of dieldrin on the benthic fauna. Bioassays were conducted to determine the LC sub 50 for comparison with other species. Tissue analyses for dieldrin residues were also carried out by gas-liquid chromatography. The 24-hr LC sub 50 for dieldrin was 0.016 ppm. Minimum residue levels of dieldrin in skeletal muscles, liver, and brain were 1-2 ppm. (Holoman-Battelle)

PHYTONEUSTON ECOLOGY OF A TEMPERATE MARINE LAGOON,
American Univ., Beirut (Lebanon). Dept. of Biology.
J. T. Hardy.
Limnology and Oceanography, Vol 18, No 4, p 525-533, July 1973. 4 fig, 1 tab, 32 ref.

Descriptors: *Lagoons, *Temperate, *Ecology, Phytoplankton, *Bays, Dominant organisms, Primary productivity, Standing crops, Biological communities, Protozoa, Marine algae, Plankton, Water sampling, Water analysis, Surface waters, Water temperature, Sea water, Ecological distribution, Photosynthesis, Salinity, Wind velocity, Dinoflagellates, Diatoms, Chrysophyta, Pyrrophyta, Plant pigments, Biomass, Marine animals.
Identifiers: *Marine environment, *Phytoneuston, Sample preservation, Sample preparation, Species diversity, Species abundance, Silicoflagellates, Neuston, Chlorphyll a, Pheophytin, Cylindrotheca spp, Navicula directa, Pleurosigma spp, Gyrosigma spp, Thalassionema nitzschiodes, Chroomonas spp, Prorocentrum minimum, Navicula ostrearia, Amphiprora alata, Amphora turgida, Nitzschia longissima, Dityocha fibula, Mesodenium rubrum.

Comparison of neuston (upper 0.4 cm) and plankton (10 cm deep) water samples from a temperate marine lagoon and an adjacent, less sheltered bay indicates that: (1) the surface microlayer exhibits greater and more rapid environmental fluctuations than the subsurface water; (2) no abundant phytoneuston populations develop outside the lagoon; (3) in the main lagoon fairly abundant phytoneuston populations develop; (4) phytoneuston populations are most developed in the shallow sheltered pond area of the lagoon, particularly in summer; (5) taxonomic diversity is generally lower and dominance greater in well-developed phytoneuston populations than in underlying phytoplankton populations; (6) photosynthetic assimilation ratios are greater in phytoneuston than in phytoplankton populations. TOTAL DISSOLVED ELECTROLYTE EFFECTS ON PERIPHYTON,
Ottawa Univ. (Ontario).
M. Dickman.
Journal Water Pollution Control Federation, Vol 45, No 10, p 2211-2215, October 1973. 2 fig, 2 tab, 11 ref.

Descriptors: *Periphyton, *Electrolytes, *Dissolved solids, *Water pollution effects, *Liquid wastes, *Pulp wastes, Sessile algae, Water chemistry, Bioindicators, Monitoring, Protozoa, Salts, Aquatic algae, Water sampling, Industrial wastes, Effluents, Dominant organisms, Conductivity, Water temperature, Phenols, Chlorides, Nitrates, Phosphates, Turbidity, Suspended solids, Biochemical oxygen demand, Chlorophyta.
Identifiers: Data interpretation, Enumeration, Ottawa River, Sarcodina, Spirogyra, Ulothrix, Trachelomonas, Arcella vulgaris, Cochiliopodium, Cryptodifflugia, Difflugia, Difflugia constricta, Difflugia corona wallich, Difflugia oblonga, Euglypha, Heleospera, Hyalosphenia, Lesquereusia, Microcorycia, Pseudodifflugia, Sphenoderia, Clathrulina, Raphidiophyrs, Achnanthes, Achnanthes exigua, Achnanthes flexella, Achnanthes lanceolata, Achnanthes lapponica, Achnanthes suspecta, Amphora, Amphora normani.

Periphyton are good pollution indicators because they, unlike many fish and bottom fauna, cannot leave an area during severe pollution and return after conditions have improved. A study was made of the periphyton above and below a sulfite pulp and paper mill. Continuous conductivity monitoring supplemented the data collected on pH, temperature, alkalinity, oxygen, and turbidity. Results showed no significant differences in any of the water chemistry parameters above or below the pulp mill. The continuous monitoring, however, revealed peak values for conductivity below the mill that were not duplicated above the mill. The peaks indicated a change in one or more of the parameters that could not be found using random sampling techniques. (Holoman-Battelle)

AN INTRODUCTION TO THE PHYTOPLANKTON, PRIMARY PRODUCTION AND RELEVANT HYDROGRAPHY OF LOCH ETIVE,
University of Strathclyde, Glasgow (Scotland). Dept. of Applied Microbiology.
B. J. B. Wood, P. B. Tett, and A. Edwards.
Journal of Ecology, Vol 61, No 2, p 569-585, July 1973. 5 fig, 7 tab, 17 ref.

Descriptors: *Biomass, *Phytoplankton, *Primary productivity, *Carbon cycle, *Diatoms, Dominant organisms, Light intensity, Salinity, Pigments, Hydrography, Photosynthesis, Standing crops, Radioactivity techniques, Meteorology, Currents (Water), Sea water, Brackish water, Dinoflagellates.
Identifiers: Chlorophyll a, Pheophytin, *Scotland (Loch Etive), Sample preparation, Peridinium trochoideum, Peridinium (Heterocapsa) triquetra, Dinophysis, Prorocentrum micans, Gonyaulax, Skeletonema costatum, Coscinosira polychorda, Lauderia borealis, Chaetoceros, Rhizosolenia, Leptocylindrus danicus, Cerataulina pelagica, Asterionella formosa, Tabellaria, Thalassiosira.

Primary productivity was measured in Loch Etive for the purpose of estimating the contribution of phytoplankton to the carbon cycle. The meteorology and hydrography were also assessed. Phytoplankton as collected at various depths in plastic water bottles, filtered, pigment extracted, and chlorophyll and phaeophytin measured by fluorescence. Phytoplankton as identified and counted under the microscope. Primary production was measured by the C-14 method. The loch has a large catchment area, and inflowing freshwater reduces average salinity. Analysis of currents in terms of a two-layer system shows that separation of the deep (salty landwards flowing) and surface (brackish, seawards flowing) layers proceeds at 6-8 km/day. The upper 10 m of the water column corresponds approximately to the brackish and the euphotic zone. Standing crop in this zone of the lower loch ranged from about 7 to about 250 mg C/cu m based on pigment measurements. Skeletonema costatum was the dominant phytoplankter but small flagellates were also important. About 70 g C/sq m/yr is a rough estimate of gross annual primary production in the euphotic zone of the lower basin. A number of factors qualify this value, most important being difficulties in measuring CO2 concentrations, and day-to-day fluctuations in light intensity. Light is considered to be the most important limiting factor in the loch, and the effects of the wet west highland climate dominate the ecology of the phytoplankton. (Little-Battelle)

BOTTOM FAUNA CHANGES DURING ARTIFICIAL RESERVOIR DESTRATIFICATION,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Fisheries and Wildlife Sciences.
R. T. Lackey.
Water Research, Vol 7, No 9, p 1349-1356, September 1973. 1 fig, 5 tab, 27 ref.

Descriptors: *Benthic fauna, *Aquatic populations, *Aeration, *Destratification, Midges, Isopods, Amphipoda, Annelids, Diptera, Sampling, *Colorado.
Identifiers: *Parvin Lake (Colo), Macroinvertebrates.

Parvin Lake, Colorado, a 19 ha mesotrophic reservoir with maximum depth of 10 m and mean depth of 4.4 m, was studied to evaluate the effects of thermal destratification (aeration) on bottom fauna. Identical sampling programs were carried out during a control year (Nov 1968-Oct 1969) and a treatment year (Nov 1969-Oct 1970). Samples were collected with an Ekman dredge, sieved through a wash bucket and the organisms separated by sugar flotation and rose bengal dyeing. Sampling sites (4) were selected on the basis of previous studies, preliminary sampling, and depth. Four macrobenthic species were abundant during the study: Asellus intermedius (isopod), Chaoborus sp. (phantom midge), Hyalella azteca (amphipod), and Lumbriculus inconstans (annelid). Several species of Chironomidae were present and treated collectively. Hyalella significantly increased in abundance in shallow water during destratification. Chironomid larvae declined in abundance in the profundal zone during destratification in Winter and Summer. Asellus, Chaoborus, and Lumbriculus were not significantly altered in abundance during destratification. (Little-Battelle)

EFFECT OF COPPER AND HEXAVALENT CHROMIUM ON THE SPECIFIC GROWTH RATE OF CILIATA ISOLATED FROM ACTIVATED-SLUDGE,
Tokyo Univ. (Japan). Inst. of Applied Microbiology.
R. Sudo, and S. Aiba.
Water Research, Vol 7, No 9, p 1301-1307, September 1973. 1 fig, 2 tab, 11 ref.

Descriptors: *Protozoa, *Bioassay, *Toxicity, *Copper, *Chromium, *Growth rates, Sewage bacteria, Cultures, Heavy metals, Resistance, Water pollution effects.
Identifiers: Vorticella microstoma, Colpidium campylum, Opercularia, Alcaligenes faecalis, Copper sulfate, Potassium dichromate.

Three species of protozoa, Vorticella microstoma, Colpidium campylum, and Opercularia sp., which commonly occur in activated sludge, were cultured in the presence of copper and hexavalent chromium to determine the effect of these metals on growth rates. Alcaligenes faecalis, which was found to be essentially unaffected by Cu and Cr, was added to mass and monoxenic cultures of protozoa as the sole food source. Metallic concentrations ranged from 0.05 to 1.6 mg Cu/l and 0.10 to 51.2 mg Cr/l which were added as copper sulfate and potassium dichromate. The term IL sub m (median inhibitory limit) was used to define the metal concentration required to reduce the specific growth rate of protozoa to one-half of that of a control. The IL sub m for copper was: 0.25 mg/l (V. microstoma), 0.32 mg/l (C. campylum), and 0.27 mg/l (Opercularia sp.). Regarding hexavalent chromium, IL sub m for V. microstoma, C. campylum, and Opercularia sp. were 0.53, 12.9 and 20.2 mg/l, respectively. Acclimation of each protozoa to these metals for 96 hr resulted in IL sub m enhanced values of 1.2-2.2 times as large as that for the control. (Little-Battelle)

INFLUENCE OF HUMIC SUBSTANCES ON THE GROWTH OF MARINE PHYTOPLANKTON: DIATOMS,
Bedford Inst., Dartmouth (Nova Scotia).
A. Prakash, M. A. Rashid, A. Jensen, and D. V. Subba Rao.
Limnology and Oceanography, Vol 18, No 4, p 516-524, July 1973. 7 fig, 3 tab, 27 ref.

Descriptors: *Humic acids, *Fulvic acids, *Diatoms, *Growth rates, *Water pollution effects, *Laboratory tests, Phaeophyta, Plant growth, Mangrove swamps, Marine algae, Kelps, Organic compounds, Organic acids, Phytoplankton, Chrysophyta, Decomposing organic matter, Primary productivity, Radioactivity techniques, Isolation, Separation techniques, Photosynthesis, Bioassay.
Identifiers: Cell volume, Chlorophyll a, Culture media, Sample preparation, Column chromatography, Fucus vesiculosus, Laminaria digitata, Skeletonema costatum, Thalassiosira nordenskioldii, Phaeodactylum tricornutum, Axenic cultures, Assimilation.

Humic compounds isolated from brownish water of a mangrove swamp and from Fucus vesiculosus and Laminaria digitata were studied in relation to their influence on the growth of axenic and nonaxenic marine diatom cultures. Growth was measured by estimation of cell numbers and volumes at frequent intervals in a Coulter counter equipped with a volume converter. Responses to humic additives were determined by exposing the cultures to 1 or 5 micro Ci of activity of C-14 added as C-14-Na2HCO3 and incubating them at 10 C and 4 klux light intensity for 2-4 hr. The activity was measured with a thin-window gas-flow counter. Chlorophyll a content was also measured. The humic and fulvic acids extracted from decomposed residues of the two littoral marine algae and from mangrove leachates, stimulated the growth of a number of marine diatoms. This stimulatory effect was dependent on the concentration as well as the molecular size of the humic additive. Low molecular size fractions at low concentrations generated the maximum growth responses, as evidenced by increased cell yield, growth rate, chlorophyll concentration, and radiocarbon assimilation. ENVIRONMENTAL CONTROL OF PHYTOPLANKTON CELL SIZE,
British Columbia Univ., Vancouver. Inst. of Oceanography.
T. R. Parsons, and M. Takahashi.
Limnology and Oceanography, Vol 18, No 4, p 511-515, July 1973. 1 fig, 3 tab, 18 ref.

Descriptors: *Phytoplankton, *Environmental effects, *Physiological ecology, *Plant growth, Growth rates, Limiting factors, Marine algae, Marine microorganisms, Light intensity, Mixolimnion, Tropical regions, Antarctic, Estuarine environment, Plant physiology, Nutrients, Ammonia, Nitrates, Upwelling, Dominant organisms.
Identifiers: *Cell size, Ditylum brightwellii, Coccolithus huxleyi, Coastal waters, Marine environment, Sinking rates.

On the basis of ecological and physiological data, those determinate factors contributing to phytoplankton cell size are the: (1) rate of nitrate or ammonia input to the cell, (2) extinction coefficient of the water, (3) mixed layer depth, (4) light intensity, (5) sinking rate of phytoplankton, and (6) upwelling velocity of the water. Two different sized species of phytoplankton, the large Ditylum brightwellii and the small Coccolithus huxleyi, were used to demonstrate this phenomenon mathematically. From the results obtained it was apparent that the growth rates for C. huxleyi are higher than those for D. brightwellii in areas which are known to be predominated by small-celled phytoplankton (e.g. stable subtropical seas such as the Sargasso Sea and temperate waters such as the subarctic Pacific). On the other hand the larger phytoplankton species shows a higher growth rate in areas of tropical and antarctic upwelling as well as in coastal environments; this also is in general agreement with current observations. EFFECT OF HYDROLYSIS PLANT EFFLUENTS ON FISH (VLIYANNE NA RYB STOCHNYKH VOD GIDROLIZNOGO ZAVODA),
Meditsinskii Institut, Irkutsk (USSR).
G. A. Borodina.
Rybnoe Khozyaistvo, No 1, p 19-21, 1972. 2 tab.

Descriptors: *Fish, *Toxicity, *Industrial wastes, *Water pollution effects, *Chemical industry, Aquatic organisms, Biochemical oxygen demand, Waste dilution, Water pollution sources, Fish behavior, Fishkill, Fisheries, Reservoir fisheries, Waste water treatment, Organic compounds, Rivers.
Identifiers: USSR, Hydroloysis industry, Furfural, Iya River (USSR).

The Tulun hydrolysis factory in the USSR discharges untreated or only partially treated effluents into the Iya River which flows into the water reservoir of the Bratsk hydroelectric power plant. Since this reservoir also serves as a fish hatchery, the toxicity of hydrolysis factory wastes was investigated in laboratory studies. Young fish were placed in (1) undiluted untreated effluent (5-day BOD 2200 mg/liter, 14.5 mg/liter furfural content), (2) in partly purified undiluted effluent (722 mg BOD, 14.5 mg furfural/liter), and (3) in the same effluents after various degrees of dilution between 1:10 and 1:1000. In (1), all fish died within 3-4 min; in (2), they died within 20-25 min. They survived for 8 days in effluents diluted 1:500, a ratio at which the partly purified effluent seemed to exert no toxic effects. Only at 1000:1 dilution did the fish remain as healthy as in pure water for at least 10 days. The actual dilution of hydrolysis factory effluents at their river discharge point is 1:25 (Stapinski-IPC).

TOXICITY OF SODIUM SULFIDE TO COMMON SHINERS -- DYNAMIC BIOASSAY,
Institute of Paper Chemistry, Appleton, Wis. Div. of Industrial and Environmental Systems.
J. R. Chevalier.
Tappi, Vol 56, No 5, p 135-136, May 1973. 2 fig, 2 tab, 2 ref.

Descriptors: *Bioassay, *Toxicity, Pollutants, *Sulfides, Fish, *Shiners, *Toxins, Testing procedures, *Water pollution effects, Resistance, Pulp wastes, Sulfur compounds, Water quality control, Aqueous solutions, Water chemistry, Aquatic animals, Effluents, Industrial wastes.
Identifiers: *Sodium sulfide, Kraft mills.

Common shiners, Notropis cornutus (Mitchill), were exposed to sodium sulfide in concentrations of 0.33 to 3.95 ppm, using a dynamic bioassay procedure to assure continuous exposure and prevent oxygen depletion in the aquaria. The dilution water (purified by reverse osmosis and held chemically constant) and the test solution (mixed at 300 ppm sodium sulfide) were delivered separately by two mechanical proportioning pumps into 12 aquaria containing 5 different toxicant concentrations plus a control in two duplicate test series. Median tolerance limits (TL50) were calculated and found to be 2.68, 1.72, and 1.64 ppm for 24, 48, and 96 hr exposures. These values are only about one-half those found in static bioassays. The apparent decrease in TL50 may be partly attributable to the instability of sodium sulfide in solution. The true TL 50 values may be still lower than the dynamically measured values. The observed lability of sulfide emphasizes the need to consider the extent of conversion or removal of such toxicants by natural processes when setting ambient river quality standards. (Brown-IPC)

BIOLOGICAL SURVEYS: INTENT METHODOLOGY, INTERPRETATION,
MacMillan Bloedel Ltd., Powell River (British Columbia). Powell River Div.
L. Melville.

Pulp and Paper Magazine of Canada, Vol 74, Convention issue, p 107-112 (Technical Paper T123-128), March 1973. 5 fig, 31 ref.

Descriptors: *Bioassay, *Pulp wastes, *Toxicity, *Waste water (Pollution), Aquatic life, *Water pollution effects, Monitoring, Water analysis, Analytical techniques, Plankton, Tidal waters, Sea water, Marine biology, Pulp and paper industry, Surveys.

Destruction of marine organisms is a well-known consequence of seawater pollution. The kind of organisms affected and the extent of destruction are a function of the type of discharged effluent and the state of the receiving water. Community structure of biological populations has been frequently to evaluate conditions of receiving waters. Guidelines that should be included in any biological survey are presented. Three methods which can be applied to the monitoring of a pulp and paper mill's receiving water are outlined and discussed, namely, intertidal, subtidal, and plankton analyses. (Brown-IPC)

D. Waste Treatment Processes

CATALYTIC OXIDATION OF ORGANICS IN WASTEWATER,
Delaware Univ., Newark. Dept. of Chemical Engineering.
R. Katzer.
Available from the National Technical Information Service as PB-226 300 $4.50 in paper copy, $1.45 in microfiche. University of Delaware Water Resources Center Project Completion Report, 1973. 126 p, 32 fig, 10 tab, 88 ref, 2 append. OWRR A-014-DEL (5). 14-31-0001-3208,-3508-3808.

Descriptors: *Catalysts, *Phenols, *Oxidation, Evaluation, *Waste water treatment, *Kinetics, Aqueous solutions, Cost analysis, Chemical reactions, Industrial wastes, Economics, Inhibitors, Copper.
Identifiers: Free radical reaction, *Catalytic oxidation, Process design, Vaporphase oxidation, Aqueous-phase oxidation.

Catalytic oxidation of phenol in aqueous solution over copper oxide was studied in batchwise mode at 1-17 atm 02 pressure and 96-200C. The application of a catalyst markedly enhances the rate and significantly reduces the amount of intermediates formed over homogeneous oxidation. The reaction exhibits an induction period and a more-rapid steady-state activity regime. The rate is first order in both phenol and oxygen in the induction period but is one-half order in oxygen in the steady-state regime and shows variable dependence on catalyst concentration. The reaction occurs by a heterogeneous-homogeneous free-radical mechanism. The cost of removing 99% of the phenol from catalytic cracker (700 ppm) and coke plant (400 ppm) effluent by aqueous-phase catalytic oxidation was estimated to be $0.35 and $0.60 per 1000 gal. Aqueous-phase catalytic oxidation appears worthy of further serious consideration for wastewater treatment where high concentrations of organics are present. It appears uneconomical for low concentrations of organics in ambient temperature wastewater.

INDIVIDUAL HOME AEROBIC WASTEWATER TREATMENT SYSTEMS,
Colorado Univ., Boulder. Dept. of Civil and Environmental Engineering.
R. N. McBride.
Available from the National Technical Information Service as PB-226 478 $4.25 in paper copy, $1.45 in microfiche. M Sc Thesis, 1972. 116 p, 9 fig, 4 tab, 11 ref. OWRR A-021-COLO (2).

Descriptors: Water pollution control, *Sewage disposal, *Septic tanks, Data collections, Testing procedures, Evaluation, Domestic wastes, Rural areas, *Waste water treatment, Aerobic treatment, Biochemical oxygen demand.
Identifiers: *Aerobic sewage disposal units.

With the continuation of construction of new individual homes located beyond municipal sewer systems, more individual treatment systems will be installed. With the problem of failures of septic tank systems due to lack of maintenance, poor construction practices, and poor soil absorption, there will be more emphasis on better treatment systems. A system that has an economic advantage over septic tanks under certain soil conditions is the aerobic system. The use of aerobic systems is described including unit functions, types of units available, and problems and recommendations for improvement. Acrobic units under experimental conditions were observed to produce a better effluent than a septic tank. However, the performance as claimed by the manufacturers, could be misleading to homeowners. Results of tests run on the units located in the field, show that the units are meeting the manufacturers standards about 20% of the time. These units only average about a 44% reduction in BOD. This is assuming an incoming BOD of 250 mg/liter. In some cases the tests showed an influent BOD greater than this. (Woodard-USGS)

DESIGN OPTIMIZATION FOR BIOLOGICAL FILTER MODELS,
Northwestern Univ., Evanston, Ill. Technological Inst.
H. B. Gotaas, and W. S. Galler.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 99, No EE6, Proceedings paper No 10191, p 831-850, December 1973. 7 fig, 1 tab, 18 ref.

Descriptors: *Linear programming, *Costs, *Trickling filters, *Filters, *Biological treatment, *Design, Mathematical models, Sanitary engineering, Environmental engineering, Biochemical oxygen demand, Filtration, *Waste water treatment, Water pollution control, Systems analysis.

An optimization method utilizing linear programming has been applied to the Eckenfelder, Galler-Gotaas, NRC, and Upper Mississippi-Great Lakes Board models for filter design, to achieve the most economical design of biological sewage filters. The cost optimization procedure provides a more effective method for treating the different variables associated with biological filters. Filter depth has the greatest influence on the most economical design with the Galler-Gotaas model, some influence in the Eckenfelder and NRC models, and no influence in the Upper Mississippi and Great Lakes model. The most economical design is achieved when the depth is maximum to permit adequate filter ventilation, after which recirculation is economical up to about four recirculations. The radius of the filter must than be increased to provide greater volume to achieve the required BOD removal. Design curves are shown for the four models. Because more variables are included in the Galler-Gotaas model, it appears to provide the best fit to treatment observations for different types of wastes. If pumping to the filters is necessary regardless of the filter depth, deeper filters with forced ventilation are more economical than shallower filters. (Bell-Cornell)

COMPUTER SIMULATION FOR UPGRADING EXISTING WASTEWATER TREATMENT FACILITIES BY CHEMICAL PHYSICAL TREATMENT,
Envirotech Corp., Brisbane, Calif.
A. S. Anand, and W. C. Laughlin, Jr.
In: Proceedings of the Summer Computer Simulation Conference, Montreal, P.Q., Canada, July 17-19, 1973. 4 p, 3 ref.

Descriptors: *Computer programs, *Simulation analysis, *Water quality control, Waste water (Pollution), *Treatment facilities, *Sanitary engineering, Design criteria, Capital costs, Operating costs, Mathematical models, Systems analysis, Waste water treatment.
Identifiers: *Chemical physical treatment, Effluent polishing, Flowsheets, Timesharing.

Presented is a computer simulation program for polishing (upgrading) effluent from existing primary or primary-secondary treatment plants. The effluent may be treated, depending on waste characteristics and effluent quality, by three flowsheets: (A) The primary-secondary effluent is treated with alum or ferric chloride and polymers for removal of phosphorous and suspended solids (after which the wastewater is passed through granular media filters to capture suspended solids); (B) the effluent from 'A' is further treated with granular activated carbon in carbon columns to remove soluble organics; and (C) the effluent from an existing plant is treated with lime to remove phosphorous and suspended solids. The simulation program provides the user with complete flexibility to consider capital and operating costs, alternative flowsheets, design criteria and other parameters important for selecting a process for effluent polishing, while providing the power to analyze these parameters with a speed and an accuracy impossible to achieve by hand calculation. Timesharing is an important feature contributing to the program's flexibility. The program will do material and heat balance where applicable in the unit operation. (Bell-Cornell)

WASTE TREATMENT FOR SMALL FLOWS,
Advanced Waste Treatment Research Lab.
J. F. Kreissl.
Available from NTIS, Springfield, Va. 22151 PB-219 950, Price $3.00 printed copy; $1.45 microfiche. Paper presented at 1971 Annual Meeting of the American Society of Agricultural Engineers, Washington State University, Pullman, June 27-30, 1971. 24 p, 14 fig, 4 tab, 7 ref.

Descriptors: *Waste treatment, *Waste water treatment, Water pollution control, *Domestic wastes, *Municipal wastes, *Industrial wastes, Methodology, Reviews, Sewage disposal, Environmental control, Septic tanks.

The Environmental Protection Agency (EPA) is pursuing development of physical-chemical systems in order to be able to meet the needs of locations where biological treatment of waste is inadequate. The EPA program in the area of small systems or individual home wastewater treatment has thus far been concerned with the development of low-cost collection systems as well as the development of a state-of-the-art survey of flow reduction and wastewater treatment for individual homes. Projects in the near future are concerned with evaluation of household waste treatment systems and the development of model codes and reliability requirements for those systems. Attempts will be made on a continuous basis to utilize advances in processing and control techniques from larger systems for the development of improved methods for the treatment of household wastewaters. Various methods of municipal and industrial wastes treatment also are reviewed. (Woodard-USGS)

Identifiers: *USSR (Ukraine).

An All-Union scientific and technical conference on protection of water resources from pollution and on their rational use in the national economy was held at Rovno in the western Ukraine, October 16-18, 1972. The conference was under the sponsorship of the Ministries of Higher and Secondary Specialized Education of the USSR and Ukrainian SSR, and the Ukrainian Institute of Water Management Engineers. Conference participants included 215 representatives from 38 educational establishments and 43 scientific-research, planning, and industrial organizations. A total of 79 papers and reports were presented. The work of the conference was divided into 3 sections: water resources, water quality, and water quality control; techniques of wastewater treatment and utilization; and water supply and modern methods of water treatment. Summaries are given of a number of papers, and general goals and research recommendations of the conference are outlined. (Josefson-USGS)

POLLUTION ABATEMENT PROJECT, BANDELIER NATIONAL MONUMENT, NEW MEXICO (FINAL ENVIRONMENTAL IMPACT STATEMENT).
National Park Service, Santa Fe, N. Mex.

Available from National Technical Information Service as EIS-NM-73-0459-F. $4.00 in paper copy. March 14, 1973. 39 p, 3 map.

Descriptors: *New Mexico, *Sewage disposal, *Sewage lagoons, *Rio Grande River, Dikes, Environmental effects, Treatments, Cess pools, Sewage treatment, Sewage lagoons, National monuments, *Waste water treatment, Pollution abatement.
Identifiers: *Environmental Impact Statements, Sandoval and Los Alamos Counties (N.M.), Sewage lift station.

The rehabilitation of the existing sewage disposal system at Bandelier National Monument, New Mexico, to eliminate contamination of the Rio Grande River and to include a lift station and two sealed sewage lagoons. The major environmental impact of this project will be beneficial, in that it will enhance both the natural and social environment of the monument. Minor and reversible adverse impacts will affect vegetation at localized sites. Four alternatives to the proposed project had been considered. The existing sewerage system consists of three septic tanks with leaching fields, an open spray field, and two sewage lagoons. The proposed sewerage systems will pick up raw sewage from the monument area. Effluent will be pumped to two evaporative lagoons. These lagoons will eliminate the leach fields and the spray field. The lagoons will be constructed of rock and earth dikes. Much of the environmental impact will be temporary in nature and will be eliminated by natural growth in a few years. Mitigating measures included in the proposed project are listed. (Sears-Florida)
W74-02801

FACTORS CONTROLLING SLUDGE DENSITY DURING ACID MINE DRAINAGE NEUTRALIZATION,
Ohio State Univ., Columbus. Dept. of Chemical Engineering.
K. Svanks, and K. S. Shumate.
Available from the National Technical Information Service as PB-226 615 $4.75 in paper copy, $1.45 in microfiche. Ohio State University Water Resources Center Project Completion Report, October 1973. 156 p, 36 ref, 11 tab, 93 ref. OWRR A-022-OHIO (1), 14-31-0001-3235.

Descriptors: *Mine Drainage, *Neutralization, *Lime, *Calcium Carbonate, *Sludge, *Density, *Recirculation, Crystallization, Catalysts, Oxygenation, Rates, Biological Oxidation, Aluminum.
Identifiers: Acid ferrous iron solution, Synthetic Acid Mine drainage, High density sludge, Magnetite, Geothite, Lepodocrocite, Catalytic oxygenation, Bacterial catalysis, Thiobacillus-Ferrobacillus, Interference.

Laboratory scale experiments were employed to investigate the feasibility of coal mine drainage neutralization treatment with the formation of magnetite and other high density/low volume sludges. Where applicable, the effects of bacterial catalysis on ferrous iron oxidation were incorporated into the investigations. Major process types studied included, magnetite formation, and high density sludge from lime (Ca (OH)2) treatment of acid mine drainage. Both acidic iron solutions and synthetic acid mine drainage were studied, primarily in batch process reaction systems, both with and without sludge observed, and interpretations draw heavily on both experimental results and an incisive literature review. Results indicate that magnetite formation, while readily accomplished, is impractical due to aluminum interference and adverse temperature effects. High density sludges of up to 30% solids, obtained in this work and reported but not explained in other literature, are associated with the fomation of crystalline goethite (Alpha Fe00H) and lepiodocrocite (gama Fe00H), enhanced by precipitation at low pH, by sludge recirculation, and by controlled ferrous oxidation rates. Bacterial catalysis is ineffective in the process optimum pH range, and CaCO3 or split CaCO3-Ca (OH)2 treatment offers fundamental advantages over Ca (OH)2 treatment. Overall project results provide a more rational basis for treatment process development and design than is currently available, and identify several promising avenuse for further process performance improvement.
W74-02827

REGIONAL WASTEWATER DEVELOPMENT PLAN, WATER QUALITY PLANNING.
Alamo Area Council of Governments, San Antonio, Tex.

1970. 38 P, 35 FIG.

Descriptors: *Planning, *Sewerage, *Waste water treatment, *Texas, Water quality control, Regional development, Management, Computer models, Urbanization, Projections.
Identifiers: *San Antonio (Tex), *Water quality management, Edwards Aquifer (Texas), San Antonio River (Tex.), Cibolo Creek (Tex.).

Results of an intensive two-year study of wastewater management in metropolitan San Antonio, Texas planning region are presented. This area has very limited surface water resources and draws its entire water supply from the Edwards Aquifer. Water removed from the aquifer is returned to the streams if it is not consumed. Water demands for the region double almost every 30 years with resultant decline in the well surface. The small local streams are increasingly becoming unable to handle the region's wastewater, and oxygen depletion during the summer is a special problem. Existing collection and treatment systems, future wastewater loads, and planning for new wastewater management systems are described. Included in the planning methodology is a computerized design model to quickly determine construction costs of alternative systems. The basic conclusion of the study is that the best approach is the use of regional sewerage systems rather than several smaller ones because of their economy and ability to meet higher levels of wastewater treatment. The two key agencies required to implement the regional system approach are the City of San Antonio and the San Antonio River Authority which have been designated by the Texas Water Quality Board to handle water quality management in the region. (Elfers-North Carolina)

SEWERAGE FACILITIES PLAN, IN ACCORDANCE WITH THE PENNSYLVANIA SEWERAGE ACT (537).
Delaware County Planning Commission, Media, Pa.

1971. 37 P, 9 MAPS, 6 TAB, 3 APPEND.

Descriptors: *Sewage, *Regional planning, Coordination, *Pennsylvania, *Planning, Urbanization, Septic tanks, Soils, Administration, Waste water disposal, *Waste water treatment, *Treatment facilities.
Identifiers: Delaware County (Pa.), Schuylkil River, Brandywine Creed, Sewerage facilities expansion.

The Pennsylvania Sewerage Facilities Ace (537) requires all cities to prepare plans for sewerage facilities 10 years into the future, and for areas not served by public sewers to determine the assimilative capacity of the soils and regulate development accordingly to prevent creation of health hazards. Groups of cities may join to prepare plans. The Delaware River Basin Commission and the Delaware Valley Regional Planning Commission urge development of plans for regionalization of public sewer systems wherever feasible. Growth and development have been strongly influenced by patterns of highway and transit facilities with intense development occurring radially out from Philadelphia and at relatively scattered locations. Watershed areas of major streams were not recognized as the potential service areas for orderly provision of sanitary sewer services. New towns provided treatment plants as needed rather than expanding existing plants closer to the Delaware River and extending interceptors through areas of lower intensity development. Delaware County characteristics, existing sewerage system, population and future growth, and the regional sewerage plan are discussed. The regional system plan is di-

vided into 6 basic watersheds, the Schuylkil River, Chester Creek, Danby Creek, Crum Creek, Ridley Creek, Brandywine Creek, and unsewered areas with requirements and projects detailed for each. Recommendations include the formulation of more detailed plans by each city consistent with this general plan, adoption of septic tank ordinances, continual modification of the county plan as development patterns change, and expansion or phasing out of specific facilities throughout the county. Large detailed maps supplement the text. (Elfers - North Carolina)

COMPREHENSIVE WATER AND SEWER STUDY, HAMILTON, WALKER, AND CATOOSA COUNTIES, (BOOK TWO).
Hensley-Schmidt, Inc., Chattanooga, Tenn.

Prepared for Chattanooga Area Regional Council of Governments, Tennessee. December, 1971. 256 p, 39 fig, 9 tab, 1 append. Tennessee P-131.

Descriptors: *Water supply, *Sewerage, *Comprehensive planning, *Tennessee, *Tennessee River, Regional analysis, *Georgia.
Identifiers: *Regionalization, Chattanooga, Hamilton County (Tenn.), Catoosa County (Ga.), Walker County (Ga.), Nickajack Lake (Tenn.), Chickamauga Lake (Tenn.).

There are 21 water supply systems in the 3-county region. Existing facilities and service areas are described for each water system, followed by current plans affecting each system and recommendations for a 5 to 10 year period. A 20-year plan for water supply based on regionalization calls for interconnection of the systems and using the largest and safest sources of water in the three-county area, thus ensuring adequate water supply at least cost. The main stream of the Tennessee River and Crystal Springs and West Chickamauga Creek in Chickamauga, Ga., are the water sources of greatest reliability. A regional water plan, including construction of a 3-county loop should be adopted to increase production facilities. Existing water supply and purification facilities should be upgraded, especially in rural utility systems. Twelve public and 52 private sewerage systems are analyzed similarly to the water systems. Three comprehensive regional sewerage plans are presented for a 20-year horizon, one of which is recommendation. This plan reduces the number of wastewater treatment plants to 5. Four plants would discharge into Chickamauga Lake and Nickajack Lake. One would discharge into Chattooga Creek in south Walker County. Operational costs appear feasible with a minimum of conflict between stream use and demand. Periodic updating of sewerage plans plus a regional wastewater collection and treatment service to upgrade degree of treatment and assume development of adequate wastewater facilities, maintenance and operation is recommended. (Stein - North Carolina)

EVALUATION OF ALTERNATES FOR WATER POLLUTION CONTROL AND RESOURCE MANAGEMENT: PHASE III, POLLUTION ABATEMENT PROJECT, LAS VEGAS WASH AND BAY, ANNEX C.
Boyle Engineering, Las Vegas, Nev.; and Cornell, Howland, Hayes and Merryfield, Las Vegas, Nev.

Prepared for the Las Vegas Valley Water District, November, 1972. 80 p, 10 fig, 7 tab, 9 append.

Descriptors: *Planning, *Waste water disposal, *Water pollution control, *Nevada, Evaporation, Treatment facilities, Water reuse, Alternative costs, *Waste water treatment.
Identifiers: Las Vegas Valley District (Nev.), *Las Vegas Wash and Bay (Nev.), Dry Lake (Nev.).

The alternative solutions investigated were: groundwater recharge, complete treatment, Colorado River return, export to Dry Lake, export to Eldorado Valley, and export to Jean Lake. Since the magnitude of problems connected with wastewater disposal and water resource development depend largely on population, all alternatives were studied for both high and low population growth ranges (1,000,000 and 800,000 permanent residents by the year 2000, respectively). The first three alternatives had been fully analyzed in the Phase II Studies, and were reevaluated only on the basis of different population and water budgets. The export systems are a combination of similar facilities that provide for export of wastewater in early year; utilize invalley uses to the maximum practical extent; and desalt wastewater to augment the potable supply when the groundwater and Colorado River resources are at capacity. The parameters used to evaluate the alternatives were: technical feasibility in 1974; meets federal and state standards; provides pollution abatement; protection of water resource; augmentation of water resource; enhancement of water quality; potential for agriculture outside Las Vegas Valley: environmental interference; environmental enchancement; interference with planned development; initial costs; staged costs; operating costs; unit costs; ability to accomodate non-potable beneficial uses; and potential for power for cooling water. Recommended was the Dry Lake Export alternative, with a provision for recovery of wastewater to supplement future potable needs. (Hoffman - North Carolina)

SOLIDS WASTE DISPOSAL.
Montgomery County Sanitary Dept., Dayton, Ohio.

February, 1973. 60 p, 4 maps, 7 tab, 21 ref.

Descriptors: *Water supply, *Groundwater recharge, *Sludge disposal, *Ohio planning, Water resources, Environmental effects, Waste water treatment, Recreation, Parks, Levees, Land reclamation.
Identifiers: Montgomery County (Ohio), Great Miami River (Ohio).

Four basic problems related to water resources and the environment involve the provision of water supplies, advanced waste water treatment, sludge disposal, and the provision of recreation facilities. A tentative solution to these problems in Montgomery County is presented. A regional waste water treatment plant is proposed in the southern part of the county on the Great Miami River. The ultimate capacity of the plant would be 100 mdg by 2020. In the meantime land acquired for expansion would be used for recreation. In addition, other large tracts of land would be purchased with 75% federal funding for sludge disposal and eventually converted to open space and recreational land. A large lagoon would be constructed to hold treated effluent and discharge it according to the flow of the River. The effluent could also be used for industrial water supply. Finally, nearby gravel pits would be used for groundwater recharge and the levees along the river would be developed for hiking and bikeways. (Elfers - North Carolina)

WATER QUALITY MANAGEMENT PLAN FOR THE GREEN AND CEDAR RIVER BASINS IN THE STATE OF WASHINGTON: PROGRESS REPORT FOR FISCAL YEAR ENDING JUNE 30, 1972.
Stevens, Thompson and Runyan, Inc., Portland, Oreg.

Prepared for Municipality of Metropolitan Seattle, River Basin Coordinating Committee. June, 1972. 44 p, 17 fig, 2 append. IGA-00037.

Descriptors: *River basin development, *River basin commissions, *Washington, Oregon, River basins, Planning, Watershed management, Pollution abatement, Water pollution control.
Identifiers: *Seattle (Wash.), Cedar River (Wash.), Green River (Wash).

King County and the municipality of Metropolitan Seattle (METRO), in response to state legislation, named the River Basin Coordinating Committee (RIBCO) to develop water pollution abatement and water resource management plans for the Cedar and Green River Basins south of Seattle. This progress report explains the overall plan for an integrated River Basin Program covering water pollution control and abatement, water resource management, land use allocation, urban runoff and basin drainage, solid waste management, and air pollution control and abatement, linked by a system evaluation model. Only the first three program elements have been funded. Work accomplished in fiscal year 1972 has included setting of goals and objectives for the total River Basin Program, development of a management structure for the program, development of a contingency plan for the environmental management information system, and data collection for the water pollution control and abatement plan. Expenditures for the fiscal year and budgets for 1973 and 1974 and progress to date on the total plan are explained. Charts show in very general terms the intended tasks to be accomplished during a three-year period. Goals, objectives, and policies for the River Basin Program are set forth in an appendix. (Stein - North Carolina)
W74-02842

PLANNING FOR WATER RESUE,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
D. A. Okun.
Journal of the American Water Works Association, Vol 65, No 10, p 617-622, October, 1973. 5 fig, 49 ref.

Descriptors: *Water reuse, *Waste water treatment, Water quality, Water quality control, Water supply, Potable water, Water pollution.
Identifiers: *Dual water systems, Non-potable water.

Present reuse of wastewater for municipal supplies is unplanned; its use poses many threats--undetected breakdowns in treatment facilities, the uncertain fate of viruses after treatment, and hundreds of new chemical compounds being introduced into wastewaters. If wastewater were treated and used for non-potable purposes, the demand on high-quality sources of raw water would be reduced, costs of providing reclaimed wastewater for non-potable uses would in many instances be less than the cost of developing additional high-quality water sources, the burden of pollution on bodies of water receiving wastes would be lessened, and the risk of ingesting contaminants in polluted water would be reduced. Colorado Springs, Singapore, and Baltimore now reuse wastewater for non-potable purposes. Direct reuse of wastewater deprives water of the benefits of time between discharge and recovery, dilution by streamwater, and disinfection by sunlight, sedimentation, and natural biochemical degradation. Reclamation of waste water for drinking poses problems because present or probably future treatment plants do not assure adequate reduction of chemical contaminants that are likely to be present in urban centers, operation of treatment facilities is almost always below design standards, technology for monitoring potable water is inadequate when water comes from contaminated sources, 'fail-safe' technology is unavailable, and the public is reluctant to ingest its own wastes. Dual water supply systems for potable and non-potable purposes are a possible solution, especially where fresh water is in short supply, at an apparent cost of only 20% higher than conventional systems. (Stein - North Carolina)
W74-02845

THE MUSKEGON COUNTY PLAN OF WASTE WATER REUSE.

Public Works, Vol 104, No 10, p 77-79, October, 1973. 2 fig, 2 photos.

Descriptors: *Water reuse, *Waste water treatment, *Tertiary treatment, Aeration, Municipal wastes, Sewage treatment, Sprinkler, Irrigation, *Michigan, Ground water.
Identifiers: *Spray irrigation, Land spreading, *Muskegon County (Mich.).

Muskegon County, Michigan is building a complete waste water treatment plant which will include spray irrigation as tertiary treatment. The cost is $38 million, 80% of which is paid by federal and state funds. The treatment site covers 10,000 acres located 11 miles east of the metropolitan area. One third of the cost will pay for the raw wastewater collection and transport system. At the site, raw waste water will be discharged into three aerated biological treatment cells equipped with 12 aerators and 6 mixers. BOD removal is expected to be 70 to 90% after this process in normal conditions. Effluent will then flow to two storage basins and a settling basin. Water will be chlorinated prior to irrigation, reducing coliform organisms to be expected 1,000 per ml. or less. Chlorinated effluent flows through a pipe system over 27 miles long to 55 irrigation machines each of which covers a radius of 750 to 1,300 feet. Irrigation area is 6,000 acres. The aerobic soil zone is expected to act as a 'living filter.' Effluent which has seeped throught the soil will be collected by a system of 35 wells and over 100 miles of drainage tiles and pipes before being disposed into natural watercourses. It is expected that water quality of the filtered and collected water will meet U.S.P.H.S. drinking water standards. Quality of treated water and nearby groundwater will be carefully monitored by 302 observation wells. (Stein - North Carolina)

WATER SUPPLY AND SEWAGE FACILITIES PLAN UPDATE--1970, LEHIGH-NORTHAMPTON COUNTIES, PENNSYLVANIA.
Lehigh-Northampton Counties Joint Planning Commission, Lehigh Valley, Pa.

September 1971. 141 p, 23 fig, 21 tab, 6 appendices. H. V. Department.

Descriptors: *Planning, *Water supply development, *Sewerage, *Long-term planning, *Regional development, Sewers, Water treatment facilities, Municipal water, Urbanization, Pennsylvania, Water resources development.
Identifiers: *Lehigh County (Pennsylvania), *Northampton County (Pennsylvania).

The Commonwealth of Pennsylvania requires its municipalities to adopt and periodically update a plan for sewage systems pursuant to the Pennsylvania Sewage Facilities Act (Act 537). Further, the U.S. Department of Housing and Urban Development required the Joint Planning Commission of Lehigh-Northampton Counties to prepare a regional water and sewer facilities plan to serve as a guide for evaluating applications for federal grants-in-aid for water and sewer projects. The plan described in the report was adopted by the Commission on October 21, 1971. Detailed recommendations are given for improvements to the water and sewage systems in various service areas in the two counties. The goals of the update were formulated to support comprehensive regional objectives. Specific goals were outlined as follows: (1) to provide public sewerage and water systems in existing urbanized areas in the Lehigh Valley which presently do not have these facilities; (2) to provide public sewerage and water systems in portions of the Region that are designated in the Regional Comprehensive Plan for urban growth and development in the future; (3) to stage the development of public utility systems in such a way that the timing and sequence of construction relates directly to the growth of an orderly land development pattern and provision of other facilities such as new roads; (4) to develop regional public utility systems where such regional systems are more economical or efficient than a conglomeration of local municipal systems or where a regional system can effectively reduce existing or potential environmental problems; and (5) to reduce pollution problems in the Lehigh Valley. ACTIVE PROJECTS, PURE WATERS RESEARCH.
New York State Dept. of Environmental Conservation, Albany.

August 1973. 29 p.

Descriptors: *Research and development, *Projects, *Research facilities, *Priorities, *New York, State governments, Water pollution control, Waste water disposal, Eutrophication, Waste water treatment.

Current active projects are listed of the Research and Development Unit of the New York State Department of Environmental Conservation. This unit has responsibility for identifying and fostering studies of important problems of environmental degradation affecting the people of New York State. It also has responsibility for developing effective procedures for halting or reversing such degradation. Some studies are carried out in-house while others beyond the capability of the Department and Unit are contracted to universities, private institutions and companies. A short description of each of the active projects is given. The titles of the nine active studies are: (1) Canadargo Lake Eutrophication Study, (2) Effectiveness of Lagoons as a Tertiary Treatment Device, (3) Evaluation of a Plastic Media Trickling Filter, (4) Fate of Applied Nutrients in Streams, (5) Land Disposal of Wastewater, (6) Nitrogen Removal by Chlorination, (7) Occurrence and Transport of Nutrients and Hazardous Polluting Substances, (8) Reduction of the Eutrophication of Lower St. Regis Lake by Point Source Phosphorus Removal, and (9) West Coxsackie Project. NUCLEAR POWER PLANT HEAT REJECTION IN AN ARID CLIMATE,
Omaha Public Power District, Neb.
F. C. Scofield, and R. A. Fazzolare.
Paper presented at American Nuclear Society, Winter meeting, Miami Beach, Florida, October 2, 1971. 28 p, 9 fig, 5 tab, 7 ref.

Descriptors: *Cooling towers, *Ponds, *Spraying, *Evaporation, *Water conservation, *Mathematical models, Electric power, Thermal power plants, Heat transfer, Cooling, Evaporation control, Water reuse, Climatology, Model studies, Arid lands, *Waste water treatment.
Identifiers: Cooling ponds.

The factors influencing evaporation from a cooling tower, cooling pond, and a cooling pond with a supplemental spray system were investigated. Estimates of the monthly and annual evaporation for each alternative are presented. The evaporation for each alternative is based on a unitized cooling demand of 1000 BTU/hr and results are then applied to a typical 800 MWE light water reactor (LWR) power plant. The three factors which form the water source criteria for a steam power plant, cooling, withdrawal, and consumption, are discussed. Computations for mechanical draft towers are performed with an analytical heat and mass balance method which includes the influence of ambient air conditions and sensible heat transfer. Use of a spray system in cooling ponds permits design for storage requirements, thereby reducing the pond surface area and evaporation. A cooling tower is perhaps the most efficient method from the standpoint of water conservation due to the absence of solar heat input. All methods reportedly consume large quantities of water. (Jerome-Vanderbilt)

THE FULL-SCALE REFINEMENT OF PURIFIED SEWAGE FOR UNRESTRICTED INDUSTRIAL USE IN THE MANUFACTURE OF FULLY BLEACHED KRAFT-PULP AND FINE PAPER,
National Inst. for Water Research, Pretoria (South Africa).
L. R. J. Van Vuuren, J. W. Funke, and L. Smith.
In: Advances in Water Pollution Research, Sixth International Conference, Jerusalem, June 8-23, 1972, p 627-636, 2 fig, 3 tab, 5 ref. Edited by S. H. Jenkins, Pergamon Press, N.Y. 1973.

Descriptors: *Pulp and paper industry, *Sewage treatment, Water reuse, Flocculation, Flotation, *Waste water treatment, Pulp wastes, Industrial wastes.
Identifiers: *Alum treatment, Excess lime treatment, South Africa.

A paper mill using purified sewage as its major source of water has experienced difficulty in meeting the increasingly rigorous brightness demands for fine bleached paper due to the presence of residual organic matter and heavy metals in the purified sewage. In laboratory-scale investigations flocculation with lime and alum gave better results than treatment with chlorine gas, sodium hypochlorite or calcium hypochlorite, or filtration through activated carbon or beds of various absorbents. Pilot plant investigations based on excess lime treatment and flocculation with alum confirmed the favorable results obtained with the former but showed that difficulties could be expected due to scaling. Water flocculated with alum required neutralization to prevent corrosion, and the reduction of heavy metals was not as good as with the lime treatment although this had little adverse effect on the brightness of the pulp; the removal of organics was of the same order as with lime treatment, and operational difficulties were less due to the absence of scale. The flotation principle proved to be far preferable to sedimentation, for not only are detergents removed but the size of the plant is reduced considerably. A full-scale plant to treat 32,000 m3/d of purified sewage effluent with alum has been erected. (DWA)

A THEORETICAL STUDY OF FACTORS INFLUENCING THE MICROBIAL POPULATION DYNAMICS OF THE ACTIVATED-SLUDGE PROCESS - I. THE EFFECTS OF DIURNAL VARIATIONS OF SEWAGE AND CARNIVOROUS CILIATED PROTOZOA,
Pollution Research Lab., Stevenage (England).
C. R. Curds.
Water Research, Vol 7, No 9, p 1269-1284, September 1973. 8 fig, 1 tab, 13 ref.

Descriptors: *Sewage bacteria, *Activated sludge, *Flow rates, Population, *Mathematical models, *Protozoa, *Growth rates, Diurnal, Competition, Computer models, Computer programs.
Identifiers: *Flagellates, Substrates, Litonotus, Hemiophrys, Trachelophyllum, Amphileptus, Vorticella, Carachesium, Opercularia, Coleps hirtus, Paramecium, Acineta, Podophrya, Aspidisca, Euplotes.

Mathematical models and computer simulations have been used in examining the theoretical implications of diurnal variations in sewage flow, bacterial content of the sewage, and sewage substrate concentration on the microbial population dynamics and effluent quality of a completely-mixed activated-sludge plant. Variations in sewage substrate resulted in variations in the concentrations of substrate in the effluent and bacteria in the sludge. Variations in the bacterial content of sewage affected only the bacteria-consuming ciliate populations whereas variations in the flow of sewage affected all populations. When all three sewage parameters were varied simultaneously the effect was cumulative. The effects of carnivourous ciliates preying on bacteria-consuming ciliates have been considered for the first time. At least four types of ciliate predator/prey situations could arise since both carnivore and prey can be either free-swimming or attached forms. In general, when the carnivore was a free-swimming form, oscillations, which may or may not dampen, were obtained; when the carnivore was an attached form, the ciliate prey was washed out of the reactor. However, the predictions of the population dynamics of the organisms also depend to a large extent on the values of the various growth constants used. (Little-Battelle)
W74-02996

INDIRECTOR CHLORINATOR,
Koehler-Dayton, Inc., New Britain Conn. (Assignee).
R. D. Russo.
U. S. Patent No 3,762,553, 3 p, 2 fig, 1 tab, 6 ref; Official Gazette of the United States Patent Office, Vol 915, No 1, p 160, October 2, 1973.

Descriptors: *Patents, *Sewage treatment, Boats, *Waste water treatment, Water pollution control, Pollution abatement, *Chlorine, Additives, Equipment, *Chlorination.

A sewage treatment system is particularly adapted for use in small boats. An additive for treating the sewage is stored in dry form, such as in tablets, in a tank separate from, but in communication with, the sewage treatment chamber. Flushing a toilet associated with the system automatically activates a water pump and causes water to be pumped from a separate source into the additive tank, dissolving a portion of the additive, and the flowing, from the tank into the treating chamber. At the same time a combination macerating and mixing unit is energized to reduce solid sewage to at least a maximum particulate size and vigorously mix and remacerate the reduced sewage with the dissolved additive flowing from the tank into the chamber. (Sinha-OEIS)
W74-02999

THERMOLYTIC SEWAGE SYSTEM,
L. M. Crampton.
U.S. Patent No 3,762,549, 3 p, 11 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 915, No 1, p 159, October 2, 1973.

Descriptors: *Patents, *Sewage treatment, *Evaporators, *Waste water treatment, Pollution abatement, *Air pollution, Water conservation, Water pollution control, *Incineration.

Sewage is burned to a fine ash and the products of combustion are utilized to heat domestic hot water as well as preheat the sewage in a holding tank. Sewage flowing from a building passes through a spherical grinder to reduce and disperse the solids through the liquid. The sewage then passes into a holding tank and from there to an evaporator. The products of combustion from the evaporator heat domestic hot water as well as preheat the tank with condensate from the products of combustion passing to a second holding tank and from there into the ground. The gaseous products of combustion flow upwardly through a stack to the air. The primary object is to provide a system for treating sewage which eliminates both ground and air pollution while reducing the sewage to a fine ash and completely burning gaseous components. (Sinha-OEIS)
W74-03001

SLURRY CONCENTRATOR AND FILTER APPARATUS,
A. H. Parmentier.
U. S. Patent No 3,762,551, 4 p, 6 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 915, No 1, p 159, October 2, 1973.

Descriptors: *Patents, *Filtration, *Slurries, *Pulp wastes, Colloids, Filters, *Waste water treatment.
Identifiers: *Paper mill wastes.

The apparatus has flat rectangular filtration cells of relatively simple, inexpensive construction. The filtration cells are stationary and mounted on stationary filter pipes. From time to time collected solids from the filtered slurry are removed by scrapers which loosen the solid material so that it falls to the bottom of a filter tank or reservoir from which the solid material or concentrated slurry is removed. The entire screening or straining area of the filter cells is always wholly immersed in the slurry being filtered. The apparatus can operate continuously, with filtrate being constantly removed, while fresh slurry is fed to the apparatus. Periodically the screening areas or surfaces are scraped clean by scrapers carried by a simple moving frame structure. The apparatus can be drained periodically and the screening areas can be flushed with a washing liquid ejected by spraying nozzles carried by the moving frame structure. The washing liquid is sprayed only during movement of the frame structure. The consumption of washing liquid is minimized and the concentration of slurry is maximized. The apparatus is arranged so that filtration and concentration of slurry can be continuous or can be performed discontinuously on predetermined quantities of slurry. The apparatus is particularly well adapted for use in paper mills where slurries containing fillers, glue, wax, resin and other colloidal materials can be concentrated and removed from the slurries. (Sinha-OEIS)
W74-03003

CONTINUOUSLY REGENERATING ACTIVE EARTH FILTERING APPARATUS FOR LIQUID WASTES,
Wallover Oil Co., East Liverpool, Ohio. (Assignee).
J. I. Wallover.
U. S. Patent No 3,762,554, 3 p, 6 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 915, No 1, p 160, October 2, 1973.

Descriptors: *Patents, *Waste water treatment, *Filtration, *Liquid wastes, Pollution abatement, Water quality control, Water pollution control, Filters.
Identifiers: Activated earth.

A continuously rotating annular foraminous table has concentric upper side walls extending upwardly from its opposite sides and concentric lower side walls extending downwardly from those sides. Overlying a segment of the table is a stationary arcuate open-bottom furnace that receives the upper side walls. A bed of activated earth is maintained on the table as the filtering material. Adjacent the exit end of the furnace there is means for delivering onto the bed a waste liquid to be filtered. Air is drawn down through the area of the bed and table outside of the furnace. A trough below that area collects the filtrate. Air is blown up between the lower side walls of the table and through the table and bed into the furnace, and means are provided in the furnace for burning out combustible contaminants collected in the bed during filtering, whereby to regenerate the bed. Smoke from the furnace is burned, and gases and solids are scrubbed out of the exhaust. (Sinha-OEIS)
W74-03004

FILTER BOTTOM AND MOLDED MODULE THEREFOR,
Rostone Corp., Lafayette, Ind. (Assignee).
M. G. Knoy, L. M. Alt, and W. M. Work.

U. S. Patent No 3,762,559, 11 p, 34 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 915, No 1, p 161, October 2, 1973.

Descriptors: *Patents, *Waste water treatment, *Filters, *Filtration, Equipment, Water quality control, Water pollution control, Pollution abatement.

A filter bottom module is provided which can be prefabricated in complete form and made in large sizes of low weight. The modules are molded of high-strength reinforced plastic in a configuration which facilitates installation and provides adequate strength to support the filter bed and withstand backwash pressures. Each module has a horizontal structural floor section formed with a horizontal wall integrally reinforced by vertical sidewalls and a network of reinforcing ribs. Its side walls are formed to interlock with each other and define grooves for the reception of grout or other sealing compound. (Sinha-OEIS)
W74-03006

APPARATUS FOR SEPARATING PAINT OR THE LIKE FROM WATER,
Otto Durr K.G., Stuttgart (West Germany). (Assignee).
R. Eisenmann.
U. S. Patent No 3,764,013, 6 p, 4 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 915, No 2, p 519, October 9, 1973.

Descriptors: *Patents, Separation techniques, *Paints, *Water purification, Wastes, *Filtration, *Coagulation, *Waste water treatment, Water quality control, Water pollution control.

A method and apparatus are provided for separating paint or similar substances from water before it is passed into a lake, river or other body of water. The contaminated water is mixed with a coagulant and compressed air to form a foamy mixture. The foam floats quickly to the surface of the water. The foam may be wiped from the surface and the water filtered before being discharged. The apparatus is designed as a circular unit requiring relatively little ground space in which the various separating containers are of an annular shape surrounding each other about a common axis. The coagulator is mounted above the central cylindrical space within the innermost annular container and extends coaxially thereto. (Sinha-OEIS)
W74-03008

METHOD FOR TREATING SEWAGE,
Cole Resedevel Corp., Fairlawn, N.J. (assignee)
W. R. Preis, and W. Cole, Jr.
U. S. Patent No. 3,766,033, 5 p, 4 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 915, No 3, p 1020, October 16, 1973.

Descriptors: *Patents, *Sewage treatment, *Chemical reactions, Color, Odor, Bacteria, Oxides, Chlorides, *Waste water treatment, Pollution abatement, Water quality control, *Oil wastes, Water pollution control, Flocculation.
Identifiers: Sodium hydroxide, Fatty substances.

A two-stage separator cell is used in a sewage treatment method. In the first stage laminar flow of the liquid is effected and electrical energy introduced into the liquid. Treatment of the effluent results in the separation of certain of the salt and water ions to produce free ions and, through a chemical reaction, sodium hydroxide. The sodium hydroxide causes a breakdown of fatty and oily substances into less complex settleable particules while the oxygen and chloride attack living organisms and colors and odors to cause a bleaching action and to oxidize bacteria and other organic material which is in suspension. In the second stage any existing residual ionization is cancelled out with a resultant rapid separation and flocculation of the solids in the solution with the air of certain oxides and chlorides. (Sinha-OEIS)
W74-03012

SEWAGE TREATMENT VESSEL,
A. D. Thompson.
U. S. Patent No. 3,767,051, 5 p, 8 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 915, No 4, p 1294, October 23, 1973.

Descriptors: *Patents, *Sewage treatment, *Waste water treatment, Equipment, *Aeration, Sediments, *Chlorination, Baffles, Water quality control, Water pollution control.

The sewage treatment vessel is constructed of fiberglass having arcuate shaped inner surfaces for the top, bottom, and side walls. All the inner surfaces are provided with reinforcing ribs which assist in breaking up large particles during agitation of the effluent. The vessel contains a primary settling chamber for receiving raw sewage, an aeration chamber having staggered, transverse baffles to optimize passage of oxygen to the effluent during the digestion process. There is a clarifying chamber for receiving the overflow from the aeration chamber. The clarifying chamber is provided with a sloped wall having an opening adjacent to the lower edge for reintroducing the sedimentary particles back into the aeration chamber for further digestion and decomposition. The effluent may be chlorinated before ultimate disposal. (Sinha-OEIS)
W74-03016

SURFACE AERATOR HAVING WAVE ATTENUATOR,
Passavant-Werke, Michelbach (West Germany). Michelbacherhutte. (assignee)
H. Auler.
U. S. Patent No. 3,767,175, 4 p, 4 fig, 1 ref; Official Gazette of the United States Patent Office, Vol 915, No 4, p 1327, October 23, 1973.

Descriptors: *Patents, *Waste water treatment, *Aerators, Equipment, Baffles, Aeration, *Baffles.

The aeration tank has at least one surface aerator which creates surface waves. One or more baffle plates extend in a horizontal direction. The baffle plates are located on or just below the surface of the liquid at or near the tank wall - the impingement zone. Such baffles influence wave formation and reflection at the tank wall by splitting the incoming waves before they impinge upon the tank wall so the vertical energy is changed into horizontally directed flow energy. (Sinha-OEIS)
W74-03018

GRANULAR TO POWDERED ACTIVATED CARBON IN POLLUTED WATER PURIFICATION PROCESS,
Atlas Chemical Industries, Inc., Wilmington, Del. (assignee)
K. E. Clapp.
U. S. Patent No. 3,767,570, 4 p, 1 fig, 2 tab, 8 ref; Official Gazette of the United States Patent Office, Vol 915, No 4, p 1419, October 23, 1973.

Descriptors: *Patents, *Waste water treatment, *Activated carbon, *Aeration, *Activated sludge, Water pollution control, Water quality control, *Pollution abatement.

Wastewater is treated with spent granular activated carbon that has been ground to a powder. The partially treated wastewater is then separated from the powdered carbon-sludge contained in it and passed through a bed of granular activated carbon. As the granular activated carbon becomes spent, it is ground to a powder for contacting the wastewater. Screened raw sewage is fed into a primary settling tank. Supernatant primary effluent is withdrawn from the primary settling tank and fed into the aeration tank. Spent granular activatedcarbon is withdrawn from the bottom of the carbon column and fed as a slurry into a wet grinder. Spent granular activated carbon is ground to an aqueous powder slurry and conveyed from the wet grinder to the aeration tank to be thoroughly mixed and contacted with effluent in the aeration tank. The activated sludge mixture from the aeration tank is then fed into a secondary settling tank. The supernatant secondary effluent is fed to the bottom of the granular carbon column and the final effluent exists. (Sinha-OEIS)
W74-03019

OIL REMOVAL FROM WASTE WATERS,
Nalco Chemical Co., Chicago, Ill. (assignee)
W. F. Lorenc, and J. A. Hyde.
U. S. Patent No. 3,767,571, 4 p, 4 tab, 5 ref; Official Gazette of the United States Patent Office, Vol 915, No 4, p 1419, October 23, 1973.

Descriptors: *Patents, *Oil pollution, Organic compounds, *Waste water treatment, *Adsorption, Pollution abatement, Water pollution control, Water quality control, Separation techniques.
Identifiers: *Magnetite.

Magnetite is to be used as an adsorbent to remove oil or other organic contaminants from waste water. Magnetite particles are added to the waste water and the mixture is agitated. The magnetite particles laden with adsorbed oil are then removed. Removal may be accomplished by filtration or by magnetic separation. (Sinha-OEIS)

THE LIQUID WASTE FACILITIES FUNCTION CONCEPT.
Charlotte, N.C. USAC Project.

Available from NTIS, Springfield, Va. 22151 as PB-220 100 Price $3.00 printed copy; $1.45 microfiche. The Charlotte Integrated Municipal Information System Project Report MIS-2301/018/00, July 1972. 233 p.

Descriptors: *Water pollution control, *Liquid wastes, *Cities, *North Carolina, Systems analysis, *Waste water treatment, Urbanization, Urban hydrology, Computers, Computer programs, Information retrieval, Design criteria, Waste disposal, Methodology, Water pollution sources, Monitoring.
Identifiers: *Charlotte (NC).

Activities from systems analysis through implementation and evaluation of urban information systems are described. The report, one of a series of Systems Conceptualization reports, documents the Charlotte Consortium's conceptualization of the City's liquid waste function, including the provision of a sanitary sewage system which treats and disposes of liquid wastes, both residential and industrial. Liquid waste facilities must be constructed and maintained, and the waste output of industries must be monitored and analyzed to determine acceptability of the industrial waste under appropriate municipal ordinances. Intended to serve as a basis for and facilitate the design of modulus related to the subject area, this document provides an in-depth operational discussion of the responsibilities defined for the function, its components and processes and relates how information systems technology may be used in the administration of these responsibilities. Included are graphic illustrations depicting user/system interaction, system products and inputs, user procedures and computer program and data requirements, and discussions of the informational relationships that exist or should exist between the subject function and other city functions. (Woodard-USGS)

THE ACTIVATED SLUDGE PROCESS USING HIGH-PURITY OXYGEN FOR TREATING KRAFT MILL WASTEWATER,
Union Carbide Corp., Tonawanda, N.Y. Linde Div.
R. J. Grader, W. D. South, and B. Djordjevic.
Tappi, Vol 56, No 4, p 103-107, April 1973. 3 fig, 2 tab, 10 ref.

Descriptors: *Oxygenation, *Waste water treatment, *Pulp wastes, *Water pollution treatment, *Biochemical oxygen demand, Microorganisms, Sludge treatment, Dewatering, Nutrients, Suspended solids, Dissolved oxygen, Oxygen, Pilot plants, Industrial wastes, Pulp and paper industry, Treatment facilities, Feasibility studies.
Identifiers: Kraft mills, Condensates, Wash water, Black liquor, White water.

In a pilot-plant feasibility study of an oxygenation system for kraft mill effluent treatment, a 1600-gal oxygenation reactor was divided into four stages by baffles and provided with a gastight enclosure. The treated waste water came from four sources, i.e., pulp wash liquor, condensates (from liquor evaporation, digester blow heat, and turpentine recovery), papermachine operation, and black liquor recovery. Their organic loads ranged from 171 to 594 lb of 5-day BOD/day/1000 cu ft, corresponding to food/microorganism ratios of 0.46-1.40 lb of BOD/day/lb of mixed liquor volatile suspended solids. A constant BOD removal rate of 91% was maintained over this entire range, the pilot plant being operated consistently at dissolved oxygen concentrations above 5 mg/liter and at mixed liquor suspended solids levels of 5000-7000 mg/liter. The secondary sludge generated, in amounts lower than reported literature values, showed good settling and thickening (dewatering) properties. Its settling ability did not diminish as the F/M ratio was raised above 1.3 and as organic loads reached 600 lb of BOD/1000 cu ft of tank volume. (Brown-IPC)

THERMAL DRYING OF ACTIVATED SLUDGE FROM PURIFICATION EQUIPMENT (TERMOSUSHKA AKTIVNOGO ILA OCHISTNYKH SOORUZHENII),
I. Z. Lipovkov, V. A. Shteerman, and A. I. Kochetkov.
Bumazhnaya Promyshlennost', No 3, p 11-12, March 1973. 1 fig, 2 tab.

Descriptors: *Sludge treatment, *Sludge disposal, *Pulp wastes, *Dewatering, *Drying, Treatment facilities, Activated sludge, Pulp and paper industry, Incineration, Fuels, Fertilizers, Moisture content, Byproducts, *Waste water treatment.
Identifiers: Particle size reduction, Grinding, Grinders, Soviet Union.

In many Soviet pulp and paper mills, spent activated sludge is dewatered in vacuum filters and then dried in heated drum dryers. Because of the low efficiency of these dryers, the discharged sludge is heterogeneous, still contains about 40% moisture, and is mostly disposed on dump heaps which threaten nearby waters by leakage. Studies at the Arkhangel'sk and Baikal pulp and paper mills suggested that drum dryers be replaced by flue gas-heated grinders, and that the dewatered and comminuted sludge be burned as fuel in steam-generating plants. The design and operation of proposed sludge-handling installations are explained. They should be able to process sedimentation tank sludge jointly with excess activated sludge, possibly into a dried product that could be partly marketed as fertilizer. (Stapinski-IPC)

ADDITIONAL PURIFICATION OF CHEMICALLY TREATED EFFLUENTS (DOOCHISTKA KHIMICHESKI OBRABOTANNYKH STOCHNYKH VOD),
G. P. Kuchin, G. A. Romanov, E. A. Perednya, Yu. M. Smirnov, and Yu. I. Rusanovich.
Bumazhnaya Promyshlennost', No 4, p 12-13, April 1973. 1 fig, 1 tab, 4 ref.

Descriptors: *Suspended solids, *Waste water treatment, *Pulp wastes, Pollution abatement, Water pollution treatment, *Filtration, *Filters, *Sands, Effluents, Industrial wastes, Particle size, Chemical precipitation, Sedimentation, Pollutants, Regulation, Water quality control, Lignins, Lipids.
Identifiers: Kraft mills, Tall oil, Sulfate soap, Rosin acids, USSR, Fatty acids, Washing.

After chemical sedimentation, kraft mill effluents still contain 30-35 mg/liter of suspended solids, such as lignin, rosin acids, fatty acids, sulfate soap, tall oil, and other materials resistant to biooxidation. Two types of sand filters (having particle sizes of 0.5-1.5 and 0.8-2.0 mm) were used in the experimental purification of a typical presedimented kraft effluent. The finer sand reduced the suspended solids from 10-30 to 1-3 mg/liter at a flow rate of 5-7 m/hr, or to 5-7 mg/liter at a filtration rate of 10 m/hr. However, an accumulating film of pollutants on the surface of sand particles proved difficult to remove by washing. The coarser sand lent itself more readily to washing, but achieved a lower solids reduction, though the results were still within the limits permitted for discharge into Soviet rivers (0-5 mg/liter). Both sands were equivalent in reductions of BOD and effluent color. (Stapinski-IPC)
W74-03071

MULTISTAGE SYSTEM FOR BIOLOGICAL PURIFICATION OF WASTE WATERS (MNOGOSTUPENCHATAYA SISTEMA BIOLOGICHESKOI OCHISTKI STOCHNYKH VOD),
V. E. Plyaka, L. I. Shmidt, V. M. Shapchenko, and V. V. Lobko.
Bumazhnaya Promyshlennost', No 4, p 10-11, April 1973. 1 tab, 1 fig, 7 ref.

Descriptors: *Pulp wastes, *Bleaching wastes, *Treatment facilities, *Waste water treatment, *Aeration, Biochemical oxygen demand, Pulp and paper industry, Organic loading, Sedimentation, Equipment, Pollution abatement, Industrial wastes.
Identifiers: Multistage treatment, Kraft mills, Tanks, White water, Black liquor, USSR.

A Soviet kraft pulp and paper mill equipped with two parallel lines for processing of combined black and white waste waters was converted into a two-stage treatment installation, in which the black effluent is treated in the first stage and the white effluent is mixed with the partly purified black effluent in the second stage. Black effluent comprises waste waters from pulpwood preparation, digester room, pulp-washing and screening rooms, recovery boiler, and yeast fermentation. White effluent includes bleach plant discharges, paper machine white water, and waste waters from fiber recovery and process water pretreatment. The black effluent treatment stage utilizes a 3700 cu m preaerator, two aeration tanks (23,240 cu m), two secondary sedimentation tanks, and auxiliary equipment for a total aeration capacity of 26,940 cu m. It processed 5.5-24.5 tons of organic load/day and reduced the 5-day BOD to 12-50 mg/liter. The white effluent treatment line (second stage) has two preaerators (21,600 cu m), four aeration tanks (56,160 cu m), four sedimentation tanks, and auxiliary equipment for a total aeration capacity of 77,760 cu m. Being relatively undercharged (compared to the first-stage equipment), the second stage processed 1-3 tons of organic pollutants and uniformly reduced the 5-day BOD to 15 mg/liter or less. The load distribution between the two stages makes it possible to disconnect one preaerator and three aeration tanks of the second stage without effect on purification efficiency. (Stapinski-IPC)
W74-03072

CHARACTERIZATION OF SULFITE PULP BLEACHING EFFLUENTS AND THEIR BEHAVIOR DURING BIODEGRADATION (ABWASSERTECHNISCHE CHARAKTERISIERUNG VON SULFITZELLSTOFFBLEICHEREI-ABWASSERN UND DEREN VERHALTEN BEIM BIOLOGISCHEN ABBAU),
A. Scherler.
Wochenblatt fuer Papierfabrikation, Vol 100, No 14, p 523-526, July 31, 1972. 7 tab, 4 fig.

Descriptors: *Biological treatment, *Waste water treatment, *Bleaching wastes, *Pulp wastes, *Activated sludge, Industrial wastes, Pulp and Paper industry, Chlorination, Waste treatment, Coniferous trees, Deciduous trees, Hardwood, Softwood, Chlorine, Toxicity, Chlorides, Biochemical oxygen demand, Chemical oxygen demand, Hydrogen ion concentration, Suspended solids, Effluents, Waste water (Pollution), *Biodegradation.
Identifiers: Beech trees, Spruce trees, Delignification, Pulp hardness, Cooking degree, Permanganate number, Hypochlorites, Chlorine dioxide, Alkaline extraction.

Extensive data are tabulated on various characteristics of bleach plant effluents obtained after chlorination, alkaline extraction, hypochlorite, and chlorine dioxide treatments of spruce vs. beech sulfite pulps. These data include pH, total solids, suspended solids, ash (combustion residue), permanganate number, chloride content, COD, and 5-day BOD before and after biological treatment for 24 hr. Depending on the wood species (coniferous vs. deciduous) and the cooking degree, the measured specific pollution loads varied from 12.3 to 25 kg/oven-dry ton of unbleached pulp for spruce, and from 22.1 to 23.4 kg/ton for beech. Provided the free Cl content did not exceed 3 mg/liter, no toxic inhibition of activated sludge microorganisms occurred. Through biological treatment alone, bleachery wastes from spruce pulps cooked to medium 'hardness' (delignification degree) could be reduced in BOD from 20 to 2-3 kg/t, in COD from 125 to 59-68 kg/t, and in permanganate value from 290 to 145-170 kg, or from 73 to 37-43 kg/ton. COLOR REMOVAL AND SLUDGE RECOVERY FROM TOTAL MILL EFFLUENT,
Continental Can Co., Inc., Hodge, La.
E. L. Spruill.
Tappi, Vol 56, No 4, p 98-100, April 1973. 1 fig, 8 ref.

Descriptors: Treatment facilities, *Pulp wastes, *Waste water treatment, *Coagulation, *Sludge treatment, *Lime, *Color, Industrial wastes, Incineration, Dewatering, Centrifugation, Sludge disposal, Sedimentation, Pollution abatement, Industrial wastes, Pulp and paper industry, Louisiana.
Identifiers: Kraft mills, Neutral sulfite pulping, Chemical recovery, Lime kilns, Carbonation.

At the unbleached kraft pulp mill of Continental Can Co. in Hodge, La., the collected effluents are being decolored by a lime treatment integrated into the mill's lime-processing system which permits recovery of both lime and fibrous sludge. A dosage of about 1000 ppm of lime achieves a color reduction of 80-90% in kraft effluents and somewhat lower reductions in neutral sulfite pulping wastes. The sludge is dewatered by centrifugation and incinerated in the lime kiln. The colored sludge has excellent settling and thickening properties while sludge from the carbonation stage shows somewhat variable sedimentation behavior. (Brown-IPC)

DETOXIFICATION OF KRAFT MILL EFFLUENTS BY FOAM SEPARATION,
B.C. Research Ltd., Vancouver.
K. S. Ng, J. C. Mueller, and C. C. Walden.
Pulp and Paper Magazine of Canada, Vol 74, No 5, p 119-123 (Technical Paper T187-191), May 1973. 2 fig, 6 tab, 18 ref.

Descriptors: *Toxicity, *Pulp wastes, *Bleaching wastes, *Waste water treatment, *Foam separation, Pulp and paper industry, *Canada, Hydrogen ion concentration, Foaming, Separation techniques, Pollution abatement, Aquatic life, Water pollution treatment, Biochemical oxygen demand, Organic loading, Effluents, Pollutants, Water pollution sources, Kraft mills.

An evaluation of foam separation as a method for removing toxic components from aqueous effluents of five bleached kraft pulp mills in British Columbia resulted in the successful detoxification of caustic extraction effluents and of combined mill effluents. Acid bleach effluents and unbleached white waters were difficult to detoxify, but their foaming characteristics could be improved and made amenable to foam detoxification by mixing them with treatable effluents. The pH of waste waters played a critical role in the detoxification process. In addition to removing toxic components, foam separation also reduced the foaming tendency of receiving waters. Concurrent reductions of BOD and total organic carbon (TOC) were minimal, averaging only about 12%. Practical implications of foam separation are also discussed. (Brown-IPC)

A GERMAN FILTER BELT PRESS (LA SIEBBANDPRESSE),

La Papeterie, Vol 94, No 9, p 748-749, September 1972. 3 fig.

Descriptors: *Treatment facilities, *Waste water treatment, Equipment, Filters, *Screens, *Separation techniques, *Sludge treatment, *Dewatering, Flocculation, Suspended solids, Industrial wastes, Waste treatment, Clogging.
Identifiers: Belt filters, Presses, *Filter presses.

A filter press (called 'Siebbandpresse') for separating sludge from industrial waste waters is described and illustrated. The waste water is pressed between an endless belt and an endless screen as the two pass over a series of rolls in a sinusoidal arrangement. Flocculants are added to the water continuously to yield a highly concentrated sludge. The endless filter belt has screen openings varying in mesh size from 200 to 1.5 micrometer, with the result that clogging is virtually eliminated. (Speckhard-IPC)
W74-03088

A NEW STEP TOWARD WASTE WATER TREATMENT (UN NOUVEAU PAS VERS LE TRAITEMENT DES EAUX USEES).

Le Papeterie, Vol 94, No 9, p 747-748, September 1972.

Descriptors: *Dewatering, *Centrifugation, *Sludge treatment, *Waste water treatment, *Flocculation, *Polyelectrolytes, Suspended solids, Centrifugal pumps, Industrial wastes, Separation techniques.
Identifiers: Sharples Super-D-Canter, Centrifuges, Flocculants.

With the aid of recently developed polyelectrolytic flocculants, centrifuges such as the 'Sharples Super-D-Canter' have become highly effective in separating sludge from industrial waste waters. Up to 99% of suspended solids can be separated, and sludges of 20-30% dryness can be obtained. (Speckhard-IPC)

UNSTEADY FLOW IN SEWER NETWORKS,
Illinois Univ., Urbana. Dept. of Civil Engineering.
A. S. Sevuk.
Available from the National Technical Information Service as PB-226 630 $10.00 in paper copy; $1.45 in microfiche. Ph D Thesis, 1973. 142 p, 29 fig, 3 tab, 47 ref. OWRR B-043-ILL (7).

Descriptors: *Unsteady flow, *Storm drains, *Urban hydrology, *Mathematical models, Design criteria, Conduits, Hydraulic design, Drainage systems, Separated sewers, Forecasting, Equations, Storm runoff, Urban drainage, Correlation analysis, Hydrologic data, Numerical analysis, Methodology.
Identifiers: *Storm sewer networks.

A mathematical simulation model was developed for unsteady free-surface flows in urban storm sewer systems with prescribed inflows. The model is intended to serve a dual purpose--flow prediction in existing sewer systems and systematic hydraulic design of the size of the sewers of an entire sewer system. The model utilizes the complete St. Venant equations rather than any of their simplified forms to describe the flow in the sewers, and it also incorporates the backwater conditions at the sewer junctions. Furthermore it includes a built-in design algorithm for determination of the sewer sizes, which is lacking in all the previously developed routing models. The St. Venant equations, when solved numerically, can accurately reproduce the experimentally observed unsteady free-surface flows in single circular conduits. To extend the numerical solution of the St. Venant equations from a single sewer to tree-type sewer systems, the hydraulic characteristics of the junctions must be considered, and a means to account for the backwater effects, i.e., mutually dependent internal boundary conditions, must be employed. Perhaps the most potential application of the model in the near future would be the identification of important parameters that affect the runoff process in storm sewer systems and consequently the development of simplified routing procedures. ENVIRONMENTAL ASSESSMENT; POLLUTION ABATEMENT PROJECT, LAS VEGAS WASH AND BAY, ANNEX B.
VTN Nevada, Las Vegas; and Jones and Stokes Associates, Inc., Las Vegas, Nev.

Final report, prepared for Las Vegas Valley Water District, Nevada. November, 1972. 166 p, 5 fig, 8 tab, 96 ref, 6 append., photos.

Descriptors: *Environmental effects, *Limiting factors, *Waste water disposal, *Water pollution control, *Nevada, Irrigation effects, Habitats, Water transfer.
Identifiers: *Las Vegas Valley (Nev.), *Las Vegas Valley Wash and Bay, Lake Mead (Nev.), Dry Lake (Nev.).

Groundwaterrecharge, complete treatment, return to the Colorado River, export to Dry Lake, Eldorado Lake, Hidden Valley and Jean Lake, a combination of alternatives, deep well disposal, and no action were evaluated separately as possible solutions to accomplish waste water management in Las Vegas Valley and eliminate pollution in Lake Mead. EPA guidelines, Council on Environmental Quality guidelines, the National Environmental Policy Act of 1969, and air and water quality standards were used as constraining and regulating guidelines and are summarized. Complete treatment rated the best alternative environmentally. Some conclusions were: (1) None of the alternatives as planned will completely meet the goal of eliminating the pollution of Lake Mead. Highly saline groundwater will continue to surface in Las Vegas Wash and flow into Lake Mead when direct discharges are stopped. (2) Las Vegas Wash will continue to exist as a permanent riparian environment, although reduced in area, even if direct discharges are stopped. An unknown amount of groundwater surfaces and flows are now in the Wash, and will continue. (3) In-valley irrigation of existing and new greenbelt areas may create offsetting environmental impacts, possibly leading to a salt buildup in the soil, decreasing the water quality in the near surface aquifer. This water will flow downslope and surface in Las Vegas Wash

(4) Dry Lake is best suited for the evaporation of effluent. (5) Application of waste water for agriculture, evaporation, or percolation will probably adversely affect regional groundwater unless it is applied in either Dry Lake or Valley or Eldorado lakebed, where deep percolation is not possible. (Hoffman - North Carolina)

EPA READIES FARM ANTIPOLLUTION GUIDELINES.

Environmental Science and Technology, Vol 7, No 9, p 796-798, September, 1973. 2 fig, 1 photo.

Descriptors: *Agricultural runoff, *Feedlots, Surface runoff, Pesticides, Fertilizers, *Farm wastes, Leaching, Water pollution, Water quality control, Insecticides, DDT, Aerobic treatment, *Waste water treatment, Pollution abatement, Waste disposal.
Identifiers: *Non-point runoff, Land spreading, Anaerobic treatment, Debris basin.

EPA guidelines to control non-point runoff from farm sources, including animal wastes, fertilizers, and pesticides are anticipated. An average-size feedlot for 30,000 herd of cattle may produce the BOD equivalent to a city of 200,000 people and a total solids output equivalent to a city of 600,000. The animal waste problem has been compounded in recent years as the number of cattle confined to feedlots increased dramatically. Farmers lack incentive to fertilize with manure because inexpensive chemical fertilizers provide 20-100 times more nitrogen per unit weight than manure. The problem with chemical fertilizers is leaching of nitrates and phosphorus into waterways. Pesticides, too, leach into water. Speculation about new EPA-approved pest controls include virus-based insecticides which injure only target species, introduction of sterilized insects, use of sex-attractant chemicals, or introduction of natural enemies. Current innovation concerning animal waste control has focused upon anaerobic and aerobic biologically active systems, land-spreading of liquid and solid wastes, incineration, dehydration, and composting. Anaerobic and aerobic waste disposal systems are discussed in more detail including design of a recently developed debris basin and holding unit. Cost of treating feedlot runoff with an aerobic biological system could be as low as $.65 per head. The uncertain effects of spreading feedlot effluent on cropland are discussed. (Stein - North Carolina)

AN ECONOMIC FEASIBILITY STUDY OF FAYETTEVILLE, NORTH CAROLINA, TREATING FORT BRAGG'S WASTEWATER,
Army Construction Engineering Research Lab., Champaign, Ill.
D. Nelson, and J. E. Matherly.
Technical Report E-9, March 1973. 21 p, 10 tab, 7 ref, 5 append.

Descriptors: *Waste water treatment, *Treatment facilities, *Economic feasibility, Waste treatment, Tertiary treatment, Estimated costs, Capital costs, Pumping plants, Water quality standards, *Operating costs, *North Carolina.
Identifiers: Fort Bragg (NC), Fayetteville (NC).

The economic feasibility of Ft. Bragg, North Carolina, entering into a cooperative waste water treatment system with the Fayetteville, North Carolina, Public Works Commission was evaluated. Ft. Bragg currently uses trickling filters for secondary treatment yielding 80-85% removal of BOD and suspended solids (SS). The estimated future standards of 15 mg/l for BOD and 10 mg/l SS will therefore require drastic changes in Ft. Bragg's existing plant. It also faces immediate problems with untreated wastes and filter backwash wastes being discharged directly into the Little River. For Ft. Bragg to continue treating its 4.7 million gallons, three pumping stations must be replaced and an activated sludge plant with tertiary filtration and chlorination must be added. Alternatively, Fayetteville treatment will require several new pumping stations. An analysis of operating and maintenance costs and amortized capital costs indicates that the yearly cost to the government for Ft. Bragg treating its own wastes is $650,000; for Fayetteville treating all waste water - $806,000; and for Fayetteville treating the gravity portion of Ft. Bragg's waste - $716,000 (under existing terms). The analysis reveals it will be best if Ft. Bragg continues and improves treatment of its own waste water. (Schroeder-Wisconsin)

REUSE IRRIGATION CUTS COSTS,
Nebraska Univ., Lincoln.
P. E. Fishbach.
Ground Water Age, Vol 6, No 12, p 26-27 and 35, 1972.

Descriptors: *Water reuse, *Irrigation water, *Recirculated water, Irrigation systems, Irrigation practices, *Recycling, Benefits, Fertilizers, *Return flow.

Up to 40% of total irrigation water losses may be due to runoff. A reuse system which can reduce nearly all of this runoff is described. The system consists of drains to intercept and carry the runoff to storage reservoirs; a pump, a power unit, and controls; and pipes to convey the water back to the irrigation system. Benefits arising from the reuse system include savings in water and irrigation labor, weed control, and reduction in possible pollution effects arising runoff. (Schroeder-Wisconsin)

APPLICATION AND OPERATION OF SLUDGE INCINERATION,
Saint Louis Metropolitan Sewer District, Mo.
P. E. Wieting, and G. R. Schillinger.
1973. 40 P, 15 FIG.

Descriptors: *Sludge disposal, *Incineration, *Sewage sludge, *Solid wastes, *Operation and maintenance, Treatment facilities, Environmental sanitation, Sanitary engineering, Sewage districts, Sludge treatment.
Identifiers: *Multiple hearth furnance, *St. Louis (Missouri), Volume reduction.

The Metropolitan St. Louis Sewer District uses the incineration process to dispose of solids in sewage sludge at two local plants which provide primary treatment of waste water. The primary advantages of the sludge incineration process is volume reduction and solids sterilization. By proper design and operation, the incineration facilities at St. Lous are utilizing these features. The operation of the multiple hearth furnace has been satisfactory and has adequately served their design purpose. The more important operational parameters are discussed. These items must be considered in the design of the overall solids handling program. Particular attention should be given to the method of dewatering the sludge. This is of a more critical consideration when waste biological sludges must be destoryed. Incineration is being adopted by many municipalities and industries. Therefore, the multiple hearth units will be installed at more locations. Some improvement in the design and operation would be desirable, even though the present units operate satisfactorily. Recovery of heat offers one potential way of improving the economy of incineration. A search of new designs to accomplish this is advisable as the heat might possibly be used to condition the sludge for incineration. Development of additional instrumentation to control the combustion process and development of some beneficial use for the ash, perhaps as an aid to sludge conditioning, would be advisable. THE DENVER SYSTEM OF CONTROLS,
Denver Water Dept., Colo.
C. E. C. Carlson.
Paper presented at the Annual Meeting of the American Water Works Association, Denver, Colorado, June 17, 1971. 9 p.

Descriptors: *Water distribution (Applied), *Water supply, *Automatic control, *Instrumentation, *Remote control, Pumping, Control systems, Distribution systems, Water delivery, Water pressure, Utilities, Colorado.
Identifiers: *Denver (Colorado).

Situated in the South Platte River Valley, Denver has grown up the slopes of the Valley, necessitating considerable pumping of water. As of 1971, the

City had 26 pump stations and 23 pressure zones, and more than 50 percent of all water supplied was pumped. Rapid growth of the area has demanded control of the pumping system. Prior to the installation of a good control system, numerous breaks occurred in the water mains. Centralized control was begun in 1947 and automatic or remote control of all pumps is now in effect. Three goals have been established for the use of controls: (1) to avoid low pressure and inadequate supplies of water, (2) to conserve water and power, and (3) to improve overall plant efficiency. Using a three-phase program, the control of the water distribution system focused first on reducing power consumption and later on the use of computers to operate the system. A fourth stage of incorporating the water treatment plants (some located as far as 150 miles from the City) into the system is envisioned. It was discovered very early in the program that a single manufacturer of equipment should be used to reduce costs and obtain maximum compatibility of system components. (Poertner)

INDUSTRIAL AND HIGH VELOCITY METERING,
Philadelphia Water Dept., Pa.
A. J. Udstuen.
Paper presented at the American Water Works Association Annual Conference, Denver, Colorado, June 14, 1971. 5 p.

Descriptors: *Water measurement, *Flow measurement, *Utilities, *Reviews, Industrial water, Industrial plants, Water consumption, Flow rates, Flow-meters, Instrumentation, High flow, Measurement, Pennsylvania.
Identifiers: Philadelphia.

Water meters for industrial users are quite important and deserve special consideration in installation, sizing, maintenance and type selection. The rates of flow should be studied in a specific application and the most efficient meter matched to the particular flows present. High velocity flows are particularly troublesome as they impose excessive wear on underdesigned meters; such flows require special meters for satisfactory long-term operation. Three types of meters are suitable for high velocity flow: (1) propeller, (2) magnetic, and (3) turbine. Propeller meters are the simplest. They have a low head loss and are easily repaired. Because such meters are of rugged construction, high velocity flows of 10 feet per second do not cause damage. Propeller meters offer an easy solution to applications in situations where low flow rates are unusual and high, varying flow rates are normal. Magnetic flow meters operate on an application of Faraday's Law--i.e., higher flow rates producing higher voltages. Having a zero theoretical head loss due to the freedom from internal obstructions, this type of meter needs a continuous source of power. Seventy watts are required for a 6-inch meter which can measure flows of one to 30 feet a minute, or 90 to 2,700 gpm. Because it is satisfactory for use under extreme operating conditions, it can be an ideal meter for industrial demands. Turbine meters are similar to propeller meters, but the blades are mounted on a horizontal axis, thereby reducing the head loss. Because the turbine wheel has a specific gravity of nearly one, it is sensitive to low flow rates. (Poertner)

IRON REMOVAL FILTER SYSTEM,
Red Jacket Mfg. Co., Davenport, Iowa. (Assignee).
K. D. Jarr, J. K. Baker, D. E. Ufford, E. M. Deters, and J. J. Hamann.
U.S. Patent No 3,762,550, 7 p, 4 fig, 1 ref; Official Gazette of the United States Patent Office, Vol 915, No 1, p 159, October 2, 1973.

Descriptors: *Patents, *Iron, *Manganese, *Hydrogen sulfide, Oxidation, *Filtration, Metals, *Zeolites, *Water treatment, Pollution abatement, Water pollution control, *Water softening.

Iron, manganese and hydrogen sulfide can be removed from water by oxidizing the same to insoluble form, which can then be removed by filtering. The system includes a filter tank containing a bed of manganese greensand or manganese zeolite iron removal mineral, and an aspirator. A flow control valve is connected to the aspirator and to the filter tank to control the various flows of water to and from the filter tank and aspirator in the different stages of a regeneration cycle. The regenerant feed system includes a regenerant feeder tank sealed from the atmosphere to receive and store a quantity of potassium permanganate crystals sufficient for a number of regenerations of the bed of iron removal material, and a water measuring tank which is vented to the atmosphere. WATER QUALITY MANAGEMENT: NEW JERSEY'S VANISHING OPTIONS.
New Jersey County and Municipal Government Study Commission, Trenton.

Eighth Report. June, 1973. 103 p, 1 map, 21 tab.

Descriptors: *Planning, *Legislation, *Institutions, Water quality, Administration, Governments, Management, Water resources, Financing, Monitoring, *New Jersey.
Identifiers: *Water quality management.

Since state government plays a key role in water management functions the report looks at all levels of government in relation to water quality management. The basic recommendation is that the State should enact strong, comprehensive legislation which establish a well defined intergovernmental institutional arrangement. Three specific areas of concern are emphasized: the need to empower local governments and the State Department of Environmental Protection (DEP) to carry out tasks mandated by Federal legislation; the need to firmly establish the function of the State DEP; and the need to define the basic role of all levels of government. A second recommednation is that there must be more emphasis on comprehensive water resource planning. Such planning is necessary to balance various goals and to serve as the basis for making important capital investment decisions. monitoring water quality, enforcement of water quality standards, and financing of water quality management programs are discussed. AN OVERVIEW OF MARYLAND'S SEDIMENT CONTROL PROGRAM,
Maryland Dept. of Natural Resources, Annapolis. Water Resources Administration.
R. A. Kanerva.
Paper presented at the American Society of Civil Engineers, Annual Water Resources Meeting, Washington, D.C., January 29-February 2, 1973. 4 p, 3 ref.

Descriptors: *Maryland, *Sediment control, *Soil erosion, *Erosion control, *Water pollution control, Sedimentation, Surveys, Political aspects, Administration, Jurisdiction, Water pollution sources, Legal aspects, Non-structural alternatives, Soil conservation, Erosion, Legal aspects, Programs.

The State of Maryland has adopted a sediment control program. The necessity for such a program is realized by the facts of sedimentation, namely: (1) over one billion tons of sediment reach the nation's rivers annually, (2) sediment removal costs between 2 dollars and 3 dollars per ton, and (3) areas undergoing construction produce an estimated 50 to 500 times the amount of sediment that rural or forested areas produce. A typical urban construction site can yield 200 tons of sediment per acre per year. The Maryland sediment control program has had its roots in the declaration by the Maryland Attorney General's Office (in about 1961) that sediment is a water pollutant. In 1965, Montgomery County, Maryland became the first county in the United States to establish a sediment control program. In 1970, a state law was passed to establish a state-wide program centering on three general principles: (1) involvement of all levels of government and economic groups, (2) prevention of sedimentation by the control of erosion, and (3) flexibility of the plans to adjust to local situations. Although the program cannot be said to be an instant success, cooperation from public officials and consulting engineers, architects and builders has been cultivated through regional meetings. 4 WATER POLLUTION, ENVIRONMENTAL ENHANCEMENT STUDY.
Lehigh-Northampton Counties Joint Planning Commission, Lehigh Valley, Pa.

September 1972. 135 p, 9 fig, 10 tab, 4 appendices. HUD Grant.

Descriptors: *Environmental control, *Environmental effects, *Water pollution control, *Water pollution sources, *Water pollution effects, Planning, Environmental engineering, Environmental sanitation, Pennsylvania, Organizations, Pollution abatement, Pollutant identification, Urbanization, Local governments, Regional analysis.
Identifiers: *Lehigh County (Pennsylvania), *Northampton County (Pennsylvania), Environmental enhancement.

Lehigh and Northampton Counties lie entirely within the Delaware River Drainage Basin which empties to Delaware Bay and then into the Atlantic Ocean below Cape May Point, New Jersey. This large watershed drains a 12,000-square-mile area that includes portions of five states: Pennsylvania, New York, New Jersey, Delaware, and Maryland. The main stem of the river, formed by the junction of the East and West Branches at Hancock, New York, is 375 miles long. Of the sixteen water service areas now functioning in Lehigh and Northampton Counties, three draw water from local surface waterways. Ground water reserves supply areas surrounding Allentown, Bethlehem and Easton in addition to providing one-fourth of the water requirements of Allentown and Bethlehem. Wells of springs provide the entire water supply in many other areas. The report includes identification of pollutants of surface and ground waters including industrial wastes, domestic wastes, leachates, oil wastes and sources of thermal pollution. Water pollution abatement activities of all levels of government are described and water quality standards and costs of pollution abatement are discussed. The groups and organizations that are working to improve water quality in the two-county region are identified. Various planning techniques are described briefly and local codes, ordinances and other pollution control methods are mentioned. (Poertner)

THE LEGAL AND REGULATORY FRAMEWORK FOR THERMAL DISCHARGE FROM NUCLEAR POWER PLANTS,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
M. S. Baram.
Environmental Affairs, Vol 2, No 3, p 505-532, 1972. 3 fig, 59 ref.

Descriptors: *Long-term planning, *Decision making, *Regulations, *Nuclear powerplants, Electric power production, Thermal powerplants, Heated water, Effluents, *Thermal pollution, Air pollution, Water pollution, Environmental effects, Natural resources, Water quality control, Legal aspects, Legislation.

Thermal air and water effluents may have impact on the local and global environment and may affect economic and social conditions. These possible effects and resource demands have brought about actions by citizen groups which have resulted in a legal and regulatory framework for power-plant decision making, particularly as it relates to thermal pollution. A model for organizing information from diverse social, technical and legal sectors, to enable power plant decision makers to assess issues before siting and construction; and an outline of the evolving legal and regulatory framework for thermal water pollution are developed. In the model each project is evaluated on the basis of the various stages of development, including site selection and design, construction, pilot program and testing, and on-going operation. SUMMARY OF LEGISLATIVE AND REGULATORY ACTIVITIES AFFECTING THE ENVIRONMENTAL QUALITY OF NUCLEAR FACILITIES.

Nuclear Safety, Vol 12, No 6, p 665-678, Nov./Dec. 1971, 1 tab.

Descriptors: *Environment, *Nuclear power plants, *Legislation, *Regulations, *Legal aspects, Electrical power productions, Safety, Environmental engineering, Administration, Water quality, Operations research, Standards, Federal government, State government, Economics, Resources, Ecological distribution, Sites, Thermal pollution, Water temperature, Streams, Aquatic life.

Environmental information processed by the Nuclear Safety Information Center derived from official government sources is summarized to show the orderly development of intent and action in government. Particular attention is placed on legislation, executive action and those regulations

that are most immediately related to environmental quality. The summary information comprises: Legislation, adopted or pending; regulations, standards and executive orders issued or proposed; and state water-quality criteria. The legislative section is subdivided into nine topics covering: organization and authority; administrative procedure; economic incentives; research and information; control of discharges; energy; resources; legal procedures; and constitutional amendments.

PROCESSES, PROCEDURES, AND METHODS TO CONTROL POLLUTION RESULTING FROM SILVICULTURAL ACTIVITIES.
Environmental Protection Agency, Washington, D.C. Office of Air and Water Programs.

Copy available from GPO Sup Doc as EP1.23: 430-73-010; $1.25, microfiche, from NTIS as PB-226 658, $1.45. Environmental Protection Agency, Report EPA 430/9-73-010, October 1973. 91 p, 17 fig, 14 tab, 57 ref.

Descriptors: *Forest management, *Pollution abatement, Water pollution control, *Erosion control, *Reforestation, Thermal pollution, Sediment control, Forest fires, Organic matter, Mineralogy, Pesticides, Fertilizers, Solar radiation, Lumbering, Water pollution sources.
Identifiers: Fire retardant shemicals, *Lumber harvesting, Lumber transport, *Nonpoint pollution sources.

Nearly 203 million hectares (500 million acres) in the United States are in forests managed primarily for the production of timber. The principal water pollutants from this land area are eroded mineral soil sediments transported in runoff; organic matter which is chiefly transmitted to the water by runoff; pesticides; fertilizers, fire retardant chemicals; and thermal pollution resulting from solar radiation. Of these pollutants, sediment, including both its organic and inorganic (mineral soil) constituents, is the greatest single cause of water quality degradation. Sediment additionally acts as a carrier of such pollutants as pesticides and phosphorus. Control of erosion due to runoff is thus the most important aspect of control of pollution from forests. Pollution from forests is nonpoint in origin, and defies control of treatment in the conventional sense. The treatment and control methodology is, therefore, principally the forest management system--the combination of practices involved in harvesting trees; log transport; reforestation; protection from fire, disease, insects and weed trees; and growth promotion. The practices in current use require adaption to meet environmental goals as well as to achieve other objectives which govern forest land use. (EPA)

PETROLEUM SYSTEMS RELIABILITY ANALYSIS, VOLUME I - ENGINEERING REPORT, A PROGRAM FOR PREVENTION OF OIL SPILLS USING AN ENGINEERING APPROACH TO A STUDY OF OFFSHORE AND ONSHORE CRUDE OIL PETROLEUM SYSTEMS,
Environmental Protection Agency, Washington, D.C. Office of Water Programs.
J. E. Ritchie, Jr., F. J. Allen, Jr., R. M. Feltes, R. Q. Foote, and W. A. Shortt.
Copy available from GPO Sup Doc as EP1.23/2: 73-2802, $1.25; microfiche from NTIS as PB-226 584, $1.45. Environmental Protection Agency, Technology Series Report EPA-R2-73-280a, 82 p, 2 fig, 3 tab, 61 ref. EPA Project No 15080 HOC. Contract 68-01-0121.

Descriptors: Oil spills, *Oil pollution, Drill holes, *Water quality standards, Data collections, *Well data, *Pollution abatement, Water pollution control.
Identifiers: *Oil spill records.

EPA's oil spill prevention program has developed a methodology for evaluating Drilling, Production, and Gathering/Distribution Systems plans to prevent spillage of crude oil. The program respons to the Federal Water Pollution Control Act, as amended in 1972. The methodology has been designed for use by EPA Regional personnel, and to minimize requirements for the special skills of a petroleum engineer or systems analyst. The scope of the study included offshore and onshore facilities in the Gulf of Mexico, Louisiana, Texas, California, and Alaska. Field surveys providing firsthand observation of selected facilities are documented. Approximately 15,000 spill records were collected from 20 data sources coving major oil producing States. Half of these records were identified as being useful to the study and are included. The report presents, for use by EPA Regional personnel, a set of checklists which identify system points of spill vulnerability, and spill prevention guidelines applicable to these points. Application of these guidelines to a specific facility will require judgment and allow innovative spill prevention measures. (EPA)
W74-02947

METHOD AND APPARATUS FOR DETERMINING A FLUID CONTAMINANT,
Texaco, Inc., New York. (Assignee).
L. M. Hubby.
U. S. Patent No 3,763,706, 4 p, 1 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 915, No 2, p 443, October 9, 1973.

Descriptors: *Patents, *Separation techniques, *Oil pollution, *Sensors, Water quality control, *Pollution abatement, Water pollution control, *Offshore platforms.
Identifiers: Petroleum production.

The presence of a contaminant in a liquid stream is sensed by a U-tube connected to the stream with a fixed height outlet leg which senses the height of the inlet leg on the U-tube. A change in the inlet height is indicative of the presence of a contaminant. The invention is a combination of elements that are in use with petroleum production operations which have a platform structure located over or near a body of water. The structure includes a deck upon which oil may gather, and a drain for carrying off fluids from the deck. Means are provided for an alarm which is actuated when oil is present in fluid draining from the deck. (Sinha-OEIS)
W74-03000

FLOATING SKIMMER,
Watermaster Industries Ltd., London (Ontario). (Assignee).
A. J. Tudor, and E. E. Tudor.
U. S. Patent No 3,762,557, 3 p, 5 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 915, No 1, p 161, October 2, 1973.

Descriptors: *Patents, *Skimming, *Oil spills, *Oil pollution, Water pollution control, *Separation techniques, Water quality control, *Pollution abatement.

A skimmer comprises a floatable upper annular section. It has a central opening; a plurality of arch-shaped cut outs are formed in its underside. A lower section is dismountably secured to the underside of the upper section. The lower section includes a central receptacle having a conical or cylindrical truncated wall and a flange portion circumscribing the upper edge of the wall. The flange portion is coterminous with the annular section of the upper section. At least three flotation cylinders are mounted at three equally spaced locations. These are selectively adjustable to vary the height of the periphery of the skimmer floating about the liquid being skimmed. (Sinha-OEIS)
W74-03005

PROCESS OF REMOVING WATER FROM SLIMES,
American Cyanamid Co., Stamford, Conn. (Assignee).
C. C. Cook, and E. M. Haynsworth.
U. S. Patent No. 3,763,041, 10 p, 4 fig, 4 tab, 3 ref; Official Gazette of the United States Patent Office, Vol 915, No 1, p 274, October 2, 1973.

Descriptors: *Patents, *Phosphates, *Phosphates, *Dewatering, Slime, *Pollution abatement, Mine water, *Waste disposal.
Identifiers: Tailings, *Rock processing.

A means is provided for eliminating the substantial waste disposal problems in disposing of slimes and tailings and, in particular, for eliminating the safety hazards as well as land and water pollution hazards. When slimes are admixed with tailings there is a substantial enhancement in the rate at which the water is released from the waste slimes of phosphate rock processing. Virtually useless slimes can be transformed into fertile soil having acceptable bearing strength so as to render such soil suitable for purposes of land reclamation and pollution control. (Sinha-OEIS)
W74-03007

MGCO3 ADDITION TO CASO4 CONTAINING SEA WATER TO PREVENT CORROSION,
For primary bibliographic entry see Field 03A.
W74-03010

APPARATUS,
Uniroyal, Inc., New York. (assignee)
G. J. Gauch.
U. S. Patent No. 3,766,738, 5 p, 3 fig, 1 ref; Official Gazette of the United States Patent Office, Vol 915, No 4, p 1213, October 23, 1973.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Pollution abatement, Barriers, Water quality control, Water pollution control, Equipment.
Identifiers: *Floating booms.

An apparatus is designed to support a floating boom which forms a barrier on the surface of a liquid and for forming a seal between the end of the boom and a fixed structure. The apparatus allows lateral and vertical displacement of the boom with changes of wind, current or tide. A deformable, resilient wall held in pressure contact with the dock while supported on a vertically and laterally movable frame displaceable along a vertical pipe spaced from the dock maintains the seal to prevent oil or other pollutants on the surface of the liquid from passing between the end of the boom and the dock. (Sinha-OEIS)
W74-03014

OIL SPILLAGE ENCLOSURE SYSTEM FOR MARINE USE,
G. J. MacLean.

U. S. Patent No. 3,766,739, 3 p, 8 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 915, No 4, p 1214, October 23, 1973.

Descriptors: *Patents, *Oil spills, *Oil pollution, Facilities, Transfer, *Ships, Water quality control, Water pollution control, *Pollution abatement.
Identifiers: Mooring facilities, Marine oil transfer facility.

An oil containment system is permanently attached to the transfer facility. It can be positioned by a single man utilizing a power assist. It consists of an enclosure system for containing floating material on a body of water between one side of a ship's hull and an adjacent mooring barrier comprising a pair of barriers expandable along the length and extending in height below and above the water surface. Each barrier has a bumper which engages with the hull of the vessel preventing oil from escaping between bumpers and the ship's hull. (Sinha-OEIS)
W74-03015

SKIMMER FOR A WATER BODY,
L. P. Flatland.
U. S. Patent No. 3,767,055, 3 p, 4 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 915, No 4, p 1295, October 23, 1973.

Descriptors: *Patents, *Skimming, *Flotsam, Screens, *Pollution abatement, Water quality control, Water pollution control.
Identifiers: Debris.

A skimmer includes a circular float fabricated of any light material, such as a foamed plastic. A frame, usually of light metal is adapted to be secured to the float by clips so that the frame and float can readily be separated. The frame in one portion is provided with a depressed yoke defining an opening or mouth between the frame and the float. Suspended from the frame and the yoke is a porous net or similar screen basket appropriately secured in place. The mesh size permits the basket readily to move through the water but is small enough to intercept debris such as leaves, twigs and other debris. The propulsion mechanism is mounted on the float and a rudder is connected to the float. A rotatable guard ring extends outward beyond the float to fend the float from obstacles and permit the float to turn away automatically. A decorative housing encloses much of the structure. (Sinha-OEIS)
W74-03017

SYSTEM FOR SURVELLANCE OF OCEAN DUMPING
Sperry Rand Corp., New York. (assignee)
P. J. Bizzigotti, and J. Charlton.
U. S. Patent No. 3,768,098, 4 p, 1 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 915, No 4, p 1537, October 23, 1973.

Descriptors: *Patents, Oceans, *Waste disposal, *Water pollution control, Water quality control, *Pollution abatement.
Identifiers: *Ocean dumping, Loran signals.

A system for determining if ocean dumping of waste materials by licensed vessels occurs in other than assigned areas utilizes Loran receiving means for providing electrical signals indicative of the vessel's position. The Loran signals are applied to a recorder in which permanent records of the Loran signals are entered at specified times in response to Print Command signals from a command unit. The command unit contains a plurality of input switches which are actuated during the occurrence of specified events such as the beginning of an actual dump operation, to produce a Print Command signal and an identifying signal indicative of the particular switch that was actuated as well as a clock signal indicative of the time of occurrence of the recorded event. The resulting record of an entire voyage is suitable for submission to the licensing agency for their review. (Sinha-OEIS)
W74-03021

METHOD FOR SEPARATING OIL FROM WATER,
Minnesota Mining and Mfg. Co., St. Paul. (assignee)
W. E. Sohl.
U. S. Patent No. 3,764,527, 3 p, 8 ref; Official Gazette of the United States Patent Office, Vol 915, No 2, p 639, October 9, 1973.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Pollution abatement, Water quality control, Water pollution control, Separation techniques.
Identifiers: Hydrophobic fibers, Oleophilic fibers.

A method is designed for removing oil films and slicks from water surfaces as well as for removing emulsified or suspended oil from water. The substances are contacted by an oleophilic fibrous web which has a large number of interconnected interstitial voids into which the oil is received and retained to the exclusion of water. The fibers are hydrophobic and have a diameter size ranging between 0.1 micron and 100 microns. The fibrous web has a bulk density, expressed as a percentage of fiber density, in the range of 2 to 35 percent. Four examples are set forth. (Sinha-OEIS)

Hawaii Univ., Honolulu. Water Resources Research Center.

Available from the National Technical Information Service as PB-226 659 $5.75 in paper copy, $1.45 in microfiche. Annual Progress report, 1973. 74 p. OWRR A-999-HI (8).

Descriptors: *Water pollution control, *Water management (Applied), *Water quality control, *Hawaii, Water reuse, Reviews, Water utilization, Water treatment, Irrigation water, Sewage treatment, Desalination, Data collections, Information retrieval, Water pollution sources, Model studies, Hydrologic data, Floods, Urban hydrology.

Water quality management is a leading issue confronting Hawaii's water resources. This report summarizes the projects in progress by the Water Resources Research Center at the University of Hawaii. The total program of the Center was marked by a sharp upswing in 1971-1972. The Office of Water Resources Research allotment and matching grant programs now account for about one-third of the Center's programs. The others include several major projects concerned with the solution of practical problems: quality of coastal waters, water recycling from sewage effluent, water quality data bank, and pumping well tests data analysis. Nearly all allotment projects are de facto matched by funds, services, and other participation contributed by water agencies in the state. (Woodard-USGS)

NEED TO IMPROVE ADMINISTRATION OF THE WATER POLLUTION RESEARCH, DEVELOPMENT, AND DEMONSTRATION PROGRAM.
General Accounting Office, Washington, D.C.

Report to the Congress, November 21, 1972. 49 p, 2 tab, 3 append.

Descriptors: *Water pollution control, *Administration, *Federal budget, Research, Research equipment, Research facilities, Laboratories, Administrative agencies, Governmental interrelations.

This report is made pursuant to the Budget and Accounting Act and the Accounting and Auditing Act. Because of the large amount of funds appropriated to the Environmental Protection Agency (EPA) for fiscal years 1956 through 1972, the General Accounting Office (GAO) examined EPA's administration of its demonstration grant program and its research grants and contracts, as well as utilization of its laboratory facilities and management of its research equipment. Included are recommendations to the EPA administrator, and suggestions for consideration by the Congress. EPA conducts the major federal water pollution control research program. (Sears-Florida)

EVALUATION OF THE TENNESSEE WATER SUPPLY PROGRAM, SUMMARY.
Environmental Protection Agency, Atlanta, Ga. Bureau of Water Hygiene.

January, 1971, 23 p, 1 fig, 3 ref.

Descriptors: *Water quality, *Standards, *Regulation, *Water policy, Water pollution, Coliforms, *Tennessee.

An evaluation was conducted at the request of the Tennessee Department of Public Health to determine the effectiveness of the Tennessee Water Supply Program, and if necessary, to recommend such improvements as may be needed to assure safe, wholesome drinking water for the residents of Tennessee. A representative sample of public, semi-public, and individual water supplies was selected for study. The basic water supply Statute, regulations, and program policies were reviewed. The Water Supply Program's activities, responsiveness to water supply problems, and staffing were also examined. A two-day and a three-day waterworks operators training course were monitored, and reported water-borne disease outbreaks were studied. Additionally, many residents, waterworks personnel, municipal officials, health officials and others were interviewed. Bacteriological and treatment plant laboratories were surveyed and evaluated. Conclusions were that the Tennessee Water Supply Program is not providing the health evaluation and engineering services necessary to fulfill its responsbilities to protect the health of the citizens of Tennessee, and recommendations for upgrading the system were presented. A FORECASTING MODEL APPLIED TO POLLUTION CONTROL COSTS,
Chase Econometric Associates, Inc., New York.
M. K. Evans.
American Economic Review, Vol 63, No 2, p 244-256, 1973. 3 tab. EPA 68-01-0737.

Descriptors: *Mathematical models, *Pollution abatement, *Economic impact, Income analysis, Employment, Prices, Investment, Industrial production, *Forecasting, Environmental control.
Identifiers: *Econometric Models, Macroeconomics.

It has been estimated that $275 billion will have to be expended to clean up the environment for the remainder of this decade. The economic effect of pollution control at the macroeconomic and industrial levels is modeled. The process begins by calculating the percentage cost increases for each polluting industry using Environmental Protection Agency figures. These increases are translated into percentage prices increases using mark-up factors obtained from the Chase Econometric model. The increase in polluting industries' prices create repercussions throughout the economy which can be found using an input-output model. The prices determined so far are not market price changes. To calculate these, the above prices are converted to aggregate demand prices. The resultant values are multiplied by a second set of mark-up factors and entered into a macro model to calculate the dynamic effects and equilibrium and investment levels. The results suggest that, except for a substantial decline in the net foreign balance, no significant economic disruption occurs from increased pollution control. Prices rise 1-1/2 - 2% depending on the indicator used, with the largest increases coming in 1975-1976. GNP also declines by $4 billion in 1976 and $8.5 billion in 1977. Unemployment would be increased by 0.1 and 0.2% for the same years. (Schroeder-Wisconsin)

A STATE/LOCAL LAKE REHABILITATION PROGRAM: A PROPOSED BILL AND COMMENTARY,
Wisconsin Univ., Madison. Inland Lake Demonstration Project.
S. Born, J. Kusler, D. Yanggen, and J. Kurtz.
Report June 1973. 91 p. 1 tab, 26 ref.

Descriptors: *Legislation, *Wisconsin, *Water law, *Water quality control, *State governments, *Local governments, Lakes, Eutrophication, Sedimentation, Coordination, Regulation, Nonstructural alternatives, Watershed management, Land use, Financing, Governmental interrelations.
Identifiers: Joint state and local programs, *Lake rehabilitation, Lake protection.

A draft of a bill that has been introduced in the Wisconsin legislature establishing a joint state-local program for lake protection and rehabilitation is included and discussed. The program attacks the principal water quality problems associated with the accelerated aging of lakes: eutrophication, sedimentation, and contamination. These problems are aggravated by increased user demand for a relatively fixed supply of lakes. Two general approaches for the rehabilitation of eutrophic and other degraded lakes are: limiting fertility by restricting nutrient inputs and managing the consequences of over-fertilization. The best means to attack these problems exist in joint state and local efforts. The draft bill establishes an interagency lake protection and rehabilitation council to function at the state level, while a special district with powers limited to lake protection and rehabilitation, operates at the local level. The funding for these programs would be provided jointly by state and local governments, with a minimum local contribution of 10% of project costs. State revenues from licence fees, sales taxes on water related commodities, or state gasoline taxes, could provide funds for a state lake rehabilitation program. (Pinsky-Wisconsin)

NEW SIMULATION APPROACHES TO THE MODELING OF ENVIRONMENTAL SYSTEMS,
California Univ., Los Angeles. Dept. of Computer Science.
W. J. Karplus.
In: Proceedings of the Summer Computer Simulation Conference, Montreal, P.Q., Canada, July 17-19, 1973. 2 p, 1 tab, 4 ref.

Descriptors: *Simulation analysis, *Digital computers, *Computer programs, Numerical analysis, Water pollution control, Aquifers, Air pollution, Thermal pollution, Land subsidence, Mathematical models, Systems analysis.
Identifiers: *Environmental systems, *Computer language.

Virtually all currently-used models of water and air resources systems are implemented as FORTRAN programs designed and optimized specifically for the field under study. This involves costly programming and debugging, making it difficult for the environmentalist to participate effectively in the model-building process. As in many other fields, a digital simulation language can help minimize the barrier between user and programmer. Recently, Digital Simulation Languages designed specifically for systems characterized by partial differential equations have proven useful in the simulation of field problems. For example, LEANS and PDEL were designed for simulating relatively small, well-behaved systems. In the case of environmental systems, the design of a useful simulation language is handicapped by the complexity and size of the fields being modeled. The approach described constitutes a preliminary effort to extend an existing and proven partial differential equation language (PDEL) to the environmental area. Success or failure in this effort will depend upon the magnitude of the penalty in terms of computing time, which will have to be paid for by the gain in user convenience and programming ease. REGIONAL PLANNING FOR SEWERAGE SYSTEMS,
Los Angeles County Sanitation District, Calif.
J. D. Parkhurst.
Paper presented at the American Society of Civil Engineers National Specialty Conference, 'Clean Water for Our Future Environment', Los Angeles, California, March 21-24, 1971. 11 p.

Descriptors: *Sewerage, *Regional analysis, *Comprehensive planning, *Sewage treatment, Municipal wastes, Industrial wastes, Water pollution control, California, Water pollution sources, Urbanization, Planning, Forecasting.
Identifiers: *Regional planning, *Multi-disciplinary studies.

Two major concepts being promoted in water pollution control--regional planning and multidisciplinary considerations--deserve more discussion on the local level then they have received to date. Both concepts are aimed to solve our modern day problems by transcending conventional political and academic boundaries. Because they require new ways of thinking, these concepts have been met with some resistance. Regional planning is a requirement for approval of federal grants for waste water treatment facility construction. Regionalization of sewerage service offers the following advantages: (1) broader bases for financing, (2) a comprehensive, uniform approach, (3) more varied alternatives, and (4) a more technically-capable staff. However, there are drawbacks to regionalization--including loss of political sensitivity and the promotion of undertakings contrary to the public wishes of all sectors. A multidisciplinary approach is needed because the modern day problems of pollution control are far too complex for all effects and side effects to be left to a single field of professionals. Specialists are needed in medicine, law, economics, chemistry, physics, public health, politics, wildlife management and engineering. Such an approach, used with regional planning is necessary for real success in pollution abatement; even with all these efforts, success will be difficult. (Poertner)

THE ECONOMIC EFFECTS OF FLOODS. INVESTIGATIONS OF A STOCHASTIC MODEL OF RATIONAL INVESTMENT BEHAVIOR IN THE FACE OF FLOODS,
Brown Univ., Providence, R.I. Dept. of Economics.
J. P. Brown.
Lecture Notes in Economics and Mathematical Systems, Vol 70. Springer-Verlag, New York 1972. 87 p. 13 fig, 66 ref.

Descriptors: *Floods, *Investment, *Stochastic processes, Risks, Land use, Flood plains, *Dynamic programming, Governments, Dams, Flood plain zoning, Insurance, *Economic impact, Simulation analysis, Flood protection.
Identifiers: Landowners, Bayesian approach.

The economic impact of floods is scrutinized as itaffects the choice of land use by a single landowner. The study makes several simplyfing assumptions; first that the landowner has a Von Neumann-Morgenstern utility function. It is also assumed that the available, mutually exclusive investment activities can be completely described by the stream of payments that they generate over time. It is finally assumed that floods are generated by a simple stochastic process, and that a flood destroys everything. Taking these assumptions under a known probability of flooding, dynamic programming models which identify the optimal investment strategy and replacement intervals are developed. When the probability of floods is unknown, a Bayesian approach is followed. In this case, the optimal program cannot simply be calculated but instead, bounds on the value of the program and some approximations and simplifications are suggested. A variety of government policies, dams, flood insurance, relief measures for flood victims, and flood plain zoning are analyzed when landowners behave as assumed in the study. A computer simulation program for simulating analysis of the Bayesian problem is described. (Pinsky-Wisconsin)

6B. Evaluation Process

RIVER: RECOMMENDATIONS FOR IMPROVING THE VALLEY ENVIRONMENTAL RESOURCES,
North Dakota State Univ., Fargo. Coll. of Engineering and Architecture.
O. S. Anderson, and M. L. Forthun.
Available from the National Technical Information Service as PB-226 628 $12.00 in paper copy, $1.45 in microfiche. Partial Completion Report WI-223-002-73, North Dakota Water Resources Research Institute, Fargo, December 1971. 158 p, 35 fig, 19 tab, 65 ref. OWRR C-2180-NDAK (no 3380) (1).

Descriptors: *Planning, *Water Management (Applied), *Administration, *River Basin Development, Land Resources, Environmental Effects, Water Resources Development, Valleys, Basins, *Land use, *Systems analysis, *North Dakota, Comprehensive planning.
Identifiers: *Red River of the North (N. Dak).

The main objective was to test the effectiveness and usefulness of the people oriented systems design approach as a viable technique for use in Water Resources planning. The program was designed to make optimum use of the water resources required for agriculture, industry and domestic uses within the Red River Basin. The systems approach used in this analysis is defined as a philosophical and methodological approach to find the solution to complex interdisciplinary problems. The steps involved in this process are: translation, analysis trade off and synthesis. A critical function of the systems approach philosophy is to provide a group with a set of ethically proper guidelines for group conduct. There were 21 faculty involved in the conduct of the research. The group developed four general recommendations. They included: (1) A comprehensive system of urban and rural land use planning should be developed. (2) The basin wide approach to planning should be carried out with local involvement. (3) An educational program for the public, leading to a better understanding of the problems and concepts of long and short term water resource management, is needed. (4) Careful study should be made before projects, which produce large scale environmental effects, are carried out. (See also W74-02652)
W74-02651

RIVER, RECOMMENDATIONS FOR IMPROVING THE VALLEY ENVIRONMENTAL RESOURCES, ADMINISTRATIVE REPORT,
North Dakota State Univ., Fargo. Coll. of Engineering and Architecture.
O. S. Anderson, and M. L. Forthun.
Available from the National Technical Information Service as PB-226 308 $3.00 in paper copy, $1.45 in microfiche. Final Completion Report, North Dakota Water Resources Research Institute, Fargo, July, 1973. 45 p, 5 fig. OWRR C-2180 (no 3380) (2).

Descriptors: *North Dakota, *Land use, *River basin development, *Administration, *Systems analysis, *Comprehensive planning, Planning, Water management (Applied), Environmental effects, River basin commissions, Optimum development plans, Regional development, Education.
Identifiers: Red River of the North (NDak).

The objectives were two fold; (1) a plan to produce guide lines and recommendations that will be useful to local regional, national and international agencies for River Basin studies. (2) provide information and expertise to develop interdisciplinary courses or programs. Both objectives were fulfilled. The voter and opinion makers must be considered in any type of contemplated project. The systems approach permits a number of ways to utilize such persons. The opinion maker can be either made a participant or used as a resource person. At least three student programs were run by faculty fellows in the academic year and one summer program which involved students and nonacademic people. The final evaluation of this program will not be available until several more years have passed because of the long-range objectives or the program. Implementation of the recommendations are necessarily political in nature. Thus, local, state, federal and international law and agreements will be necessary before most items can be implemented. In retrospect, an item lacking in this program was a provision for a follow-on program to encourage use of the recommendations. At the time, the group expected the Souris-Red-Rainy River Basin Commission to be continued with this objective in mind. (See also W74-02651)
W74-02652

A STUDY OF THE OPTIMAL MIX OF PRIVATE AND PUBLIC ACTION FOR LOCAL AND REGIONAL WATER CONSERVATION,
Delaware Univ., Newark. Div. of Urban Affairs.
R. F. Minnehan.
Available from the National Technical Information Service as PB-226 348 $2.00 in paper copy, $1.45 in microfiche. University of Delaware Water Resources Center Research Project Technical Completion Report, December 1973. 15 p. OWRR A-022-DEL (1). 14-31-0001-3808.

Descriptors: *Water conservation, Runoff, Flood control, Sewage treatment, Planning, *Delaware, Water policy, Alternative planning, Decision making.
Identifiers: New Castle County (Del.).

A set of local water resource problems were studied: upstream runoff control and downstream flooding, temporary sewage treatment plants, and choice of a regional waste water handling system. The study focus was on a preliminary test of four hypotheses about the process of design and decision-making. These hypotheses include: (H1) That for some situations a combination of privately and publicly constructed and financed conservation measures may be a more efficient choice than public actions alone and (H2) That the specific availability of funds and/or financing procedures may distort or bias the choice between alternative water conservation system. The other two hypotheses were derived from these. The policy implications of these hypotheses and their application to the case studies are discussed using verbal cost/benefit arguments to show why the hypotheses might be accepted. Some discussion of the general applicability of these hypotheses is presented.
W74-02654

MODEL FOR LANDSCAPE RESOURCE ASSESSMENT, PART I OF THE 'METROPOLITAN LANDSCAPE PLANNING MODEL' (METLAND),
Massachusetts Univ., Amherst. Dept. of Landscape Architecture and Regional Planning.
J. G. Fabos, R. Careaga, C. Greene, and S. Williston.
Available from the National Technical Information Service as PB-226 437 $4.75 in paper copy, $1.45 in microfiche. Massachusetts Water Resources Research Center, Amherst, Publication 30, Experiment Station Bulletin No. 602, 152, 1973, 32 fig, 26 tab, 120 ref, 3 append. OWRR-A-048-MASS (1). 14-31-0001-3521.

Descriptors: *Land use, *Regional analysis, *Regional development, *Resources development, *Statistical models, *Urbanization, Highway effects, *Massachusetts, Soil types, Suburban areas, Water quality, Water supply, Wildlife habitats.
Identifiers: *Boston metropolitan area, Agricultural productivity, Visual contrast, Visual diversity, Visual quality.

A model for landscape assessment was designed to estimate the losses that have resulted from post-World War II metropolitanization. Seven landscape resources variables and five subvariables were included in this study. These include water quality, water supply, agricultural productivity, wildlife productivity (open land, woodland, wetland), visual land use complexity (land use diversity and contrast), visual land use compatibility and amount of tree cover. Techniques to measure and rate the value of the variables using photogrammetric land use information and Soils Conservation Service information were developed. Three adjacent towns in the Boston metropolitan area were chosen as test sites. These sites were considered at two points in time, 1952 and 1971. The change in resource value was determined by comparing the value score for each variable for the two time frames. The results showed a negative change in resource value of the land as changes in land uses due to metropolitanization occurred. It was also found that when the visual diversity or contrast rating rose the compatibility rating decreased, thereby nullifying the positive change.
W74-02657

AN ANALYTICAL INTERDISCIPLINARY EVALUATION OF THE UTILIZATION OF THE WATER RESOURCES OF THE RIO GRANDE IN NEW MEXICO: UPPER RIO GRANDE,
New Mexico State Univ., University Park. Dept. of Agricultural Economics.
R. R. Lansford, S. Ben-David, T. G. Gebhardt, Jr., W. Brutsaert, and B. J. Creel.
Available from the National Technical Information Service as PB-226 326 $7.00 in paper copy, $1.45 in microfiche. New Mexico Water Resources Research Institute, Partial Technical Completion Report 021, 1973, 82 p, 12 fig, 33 tab, 1 append, 55 ref. OWRR A-045-NMEX (2).

Descriptors: *New Mexico, *Water demand, Economics, *Water resources development, *Economic prediction, Surface-groundwater relationships, Natural resources, Water requirements, Resource allocation, River basins, Groundwater management, Water law, Interstate compacts, International compacts, Treaties, Litigation, Water quality, *Water utilization, Human population, Employment, Industrial water, Recreation, Water management (Applied), Linear programming.
Identifiers: *Rio Grande Basin, Socioeconomic models, Groundwater appropriation, Input-output coefficients, Conjunctive use models, Economic land classification, Mathematical groundwater models, Irrigation water diversions.

An interdisciplinary approach to the solution of the water resource problems of the Upper Rio Grande region (URGR) in New Mexico was centered around a soci-economic model, with special emphasis placed upon the Rio Grande Region. Inputs into the socio-economic model were obtained from separate studies. Three sets of alternatives were considered: (1) Without a water constraint, in the Rio Grande Region, both production and depletions are expected to exhibit the largest increase (59.7 percent and 47.4 percent, respectively); (2) When a surface water constraint is imposed, the value of production is reduced by $18.1 million in 2020 and water depletions are expected to decrease about 18.1 percent by 2020; 3) When a total water constraint is imposed, the value of production is decreased $4.1 million below that expected when using only a surface water constraint, and water depletions reduced about 8.4 percent. The Upper Rio Grande Region is expected to follow the general trend of the total Rio Grande region but at a lower growth rate. The expected increase in total value of production from 1970 to 2020 is 53.8 percent, employment 53 percent, and water depletions about 20 percent. When a surface-water constraint is imposed, production is expected to be reduced $0.6 million in 2020, employment by 212 employees, and water depletions by 13,569 acre-feet. When a total constraint is imposed in the URGR, production is decreased $0.6

million in 2020, employment by an additional 212 employees, and water depletions by 13,497 acre-feet.
W74-02660

INVESTIGATION OF A NORTHEASTERN WISCONSIN LAKE ECOSYSTEM: AN INTERDISCIPLINARY APPROACH. PHASE II--MANAGEMENT PROBLEMS AND ALTERNATIVES,
Wisconsin Univ. Center, Marinette.
T. W. Thompson, A. J. Bedrosian, J. E. Berry, J. W. Kolka, and R. B. Ditton.
Available from the National Technical Information Service as PB-226 676 $3.00 in paper copy, $1.45 in microfiche. Wisconsin Water Resources Center, Madison Technical Report WIS-WRC-73-08, September 1973. 44 p, 4 fig, 1 tab, 19 ref. OWRR B-065-WIS (A).

Descriptors: *Attitudes, Economics, *Lakes, *Social aspects, Decision making, Watershed management, *Aquatic weeds, Environmental effects, *Wisconsin, *Rooted aquatic plants.
Identifiers: *Lake Noquebay (Wis), Caldron Falls Reservor (Wis), Marinette County (Wis), *Myriophyllum heteroplyllum.

Employing an interdisciplinary team approach, a recreational lake (Lake Noquebay) suffering from excessive growth of a rooted aquatic plant, Myriophyllum heterophyllum, new to Northeastern Wisconsin as a problem species, was studied over a three-year period. The plant appeared capable of regulating the nitrogen content of the lake's water and hence, controlling phytoplankton populations. However, its presence is detrimental to the recreational industry of the area and users indicate that they will avoid the lake should the problem intensify. The cause of the problem lies in the uncontrolled development of lowland areas surrounding the lake. Legal and political problems involved in the enforcement of the Wisconsin Shoreland Zoning Ordinance and in watershed management in Northeastern Wisconsin are analyzed and the importance of public education in developing political support for lake management programs is stressed. The approach adopted by the team and the conceptual model it employed are evaluated. Recommendations include that the talents present on two-year campuses throughout the state should be utilized more effectively in problem-oriented research, and that the Wisconsin Department of Natural Resources and the University of Wisconsin-Extension System assume ultimate responsibility for the management of recreational lakes in the State, assisted by citizens committees of the type developing at Lake Noquebay. (See also W74-07162)

ECONOMIC CRITERIA FOR DECISIONS ON PRESERVATION AND ALTERATION OF NATURAL RESOURCES WITH SPECIFIC REFERENCE TO FRESHWATER WETLANDS IN MASSACHUSETTS,
Massachusetts Univ., Amherst. Dept. of Agricultural and Food Economics.
T. R. Gupta.
Available from the National Technical Information Service as PB-226 440, $15.75 in paper copy, $1.45 in microfiche. Ph.D. Dissertation, August 1973. 260 p, 1 fig, 15 tab, 320 ref. B-012-MASS (4) and OWRR B-023-MASS (8) 14-31-0001-3596.

Descriptors: *Wetlands, *Economics, *Wildlife, *Aesthetics, *Flood control, *Evaluation, Northeast U.S., *Massachusetts.

Institutional forces such as laws, ownership costs and taxes, goals and plans of owners which affect wetland usage are described. Methods are given for valuing inland wetland benefits and opportunity costs and for determining the general magnitude of these values. Generally applicable criteria for making decisions for issuance of wetland alteration permits are presented. A range of wetland values was determined based on Massachusetts wetlands, with trade-off prices ranging from $500 to $60,000 per acre. (Larson-Massachusetts)

PA MONG STAGE ONE FEASIBILITY REPORT. APPENDIX VI. ECONOMIC, AGRICULTURAL, SOCIAL AND FINANCIAL ANALYSIS.
Bureau of Reclamation, Washington, D.C.

Available from the National Technical Information Service as PB-207 611, $6.00 in paper copy, $1.45 in microfiche. Agency for International Development, Washington, D.C., Report No TA/OST-AN-70-14-9, 1970. 506 p, 40 fig, 110 tab, 14 photos, 4 append.

Descriptors: *River basin development, *Asia, *Economic impact, Project feasibility, Data collections, Multi-purpose project, Benefit-cost analysis, Agriculture, Social change, Irrigation, Hydroelectric power, Benefits, Social impact.
Identifiers: *Mekong River (Pa Mong Project), *Laos, *Thailand, Economic analysis.

The general social, economic and historical background is reviewed. Water resources development is needed in the predominantly agricultural economy east of the Phu Phan Ridge including the Vientiane Plain of Laos and most of northeast Thailand north of the Chi River. The Pa Mong Project is located on the Mekong River where it forms the boundary between northern and northeast Thailand and the northwest part of Laos. A detailed review of the economy, its resources and stage in development provides a foundation for extensive discussion and analysis of both the macrol and microeconomic as well as the social impact of the project's development. Benefit-cost analysis specifically describes the feasibility of the project. Benefit-cost ratios, internal rates of return and project payout studies are considered only in the context of the social and economic setting, problems and needs of the area, present and potential patterns of resource use, and the wide range of multiple purposes, economic impacts, and social considerations described. Thus, the analysis admits to being indicative rather than conclusive in making decisions on water resource and economic development programs in the area. (See also W74-02687) (Weaver-Wisconsin)

PA MONG STATE ONE FEASIBILITY REPORT. APPENDIX VII. COROLLARY STUDIES.
Bureau of Reclamation, Washington, D.C.

Available from the National Technical Information Service as PB-207 612, $6.00 in paper copy, $1.45 in microfiche. Agency for International Development, Washington, D.C., Report No TA/OST-AN-70-14-10, 1970. 515 p, 36 fig, 148 tab, 28 ref.

Descriptors: *River basin development, *Asia, *Feasibility studies, *Project planning, *Investigations, Reservoirs, Data collections, Fisheries, Recreation, Boundaries (Property), Navigation, Flood control, Benefits, Forests, Mineralogy, Social impact, Social adjustment, Water requirements, Wildlife, Archaeology, Public health.
Identifiers: *Mekong River (Pa Mong Project), *Laos, *Thailand, People evacuation, Population resettlement.

Studies in many disciplines are presented which introduce complexities and challenges associated with the development of the Pa Mong water resources development project in Southeast Asia. Impacts and benefits of the project studied include: fisheries, recreation, public health, navigation, and flood control. A reservoir cadastral survey for Laos and specific discussions of evacuation of people from flooded areas are presented. Provincial, rural and industrial water consumption requirements were surveyed. A study of mineral resources in the area upstream from Pa Mong found no significant developed minerals, although the project was expected to enhance the value of iron, copper and manganese deposits. The project's impact on wildlife and forest resources is also reviewed. Also investigated was the effect of the project on the area's archaeology. (See also W74-02686) (Weaver-Wisconsin)

ALL-UNION CONFERENCE ON USE AND CONSERVATION OF WATER RESOURCES (VSESOYUZNOYE SOVESHCHANIYE PO ISPOL'ZOVANIYU I OKHRANE VODNYKH RESURSOV),
Yu. P. Belichenko, and Yu. I. Alekseyev.
Gidrotekhnika i Melioratsiya, No 7, p 119-121, July 1973.

Descriptors: *Conferences, *Water resources, *Water utilization, *Water conservation, Water management (Applied), Water pollution, Water treatment, Inspection.
Identifiers: *USSR.

An All-Union conference on use and conservation of water resources was held in Ul'yanovsk, April 9-10, 1973. Conference participants included 263 representatives from water-use and conservation agencies, Union ministries, scientific research institutes, and from enterprises and organizations in Ul'yanovsk and Ul'yanovsk Oblast. Subjects discussed included measures for increased conservation and improved use of natural resources; progress of state water inspections in the Ukraine; water management in the Kazakh Republic; water conservation measures in Krasnodar and Stavropol' Territories; recent scientific and technical achievements in industrial wastewater treatment; protection of natural waters from depletion and contamination; and protection of groundwater from pollution. WATER MANAGEMENT IN FINLAND (VODNOYE KHOZYAYSTVO FINLYANDII),
Politekhnicheskii Institut, Leningrad (USSR).
N. V. Zarubayev.
Gidrotekhnika i Melioratsiya, No 7, p 108-112, July 1973. 3 fig, 2 tab.

Descriptors: *Water management (Applied), *Water resources, *Water utilization, *Water supply, *Administration, Administrative agencies, Education, Schools (Education), Training, Professional personnel.
Identifiers: *USSR, *Finland.

Average annual precipitation in southwestern Finland is 650 mm and in regions above the Arctic Circle it is 400 mm. Average annual evaporation varies between 350 mm in the south to 150 mm in the north. Specific discharge of water varies between 7 and 11 liters/sec/sq km. Annual runoff of all Finnish rivers is about 110 cu km, of which 100 cu km

flows into the Baltic Sea and 10 cu km into the Arctic Ocean. Depending on the geographical location of individual regions and population density, per capita water supply varies between 3,000 and 22,000 cu m/yr. There are about 60,000 lakes in the country and their total volume is 200 cu km. Water pollution is especially widespread in heavily populated regions of the south and in areas of development of the paper and woodworking industries. According to rough estimates, total usable groundwater yield is 40 cu m/sec. The most abundant aquifers are confined to glacial deposits in the south. In 1971 water use in the country reached 90 cu m/sec, of which 65 cu m/sec was used in the woodworking industry, 15 cu m/sec in other related industries, and 9 cu m/sec for community water supplies. Seventy percent of community water supplies are derived from surface waters and 30% from groundwater. Average use rate in cities is 300 liters/day. Potential hydropower of Finnish rivers is estimated at 18 billion kwhr annually, and present production is over 11 billion kwhr. There are approximately 150 hydroelectric plants in the country, of which 43 have a capacity of over 10 Mw. Regulation of water use and training of hydraulic engineers at Helsinki Institute of Technology are discussed. (Josefson-USGS)

HYDROGRAPHY AND WATER RESOURCES OF AUSTRALIA (GIDROGRAFIYA I VODNYYE RESURSY AVSTRALII),
T. Ye Grigorkina.
Vsesoyuznoye Geograficheskoye Obshchestvo Izvestiya, Vol 105, No 4, p 339-343, July-August 1973. 1 fig, 2 tab, 11 ref.

Descriptors: *Australia, *Water resources, *Hydrography, Surface waters, Runoff, Stations, Gaging stations, Measurement.
Identifiers: *USSR, Hydrometric stations.

To assess Australia's water resources, the continent was divided into 12 drainage divisions: North-East Coast, South-East Coast, Tasmanian, Murray-Darling, South Australian Gulf, South-West Coast, Indian Ocean, Timor Sea, Gulf of Carpentaria, Lake Eyre, Bulloo-Bancannia, and Western Plateau. According to data published by the Department of National Development for the Australian Water Resources Council, the total number of stations in Australia is 3,534, of which 3,047 are hydrometric stations (772 closed, the remainder in operation) and 487 are stage-measurement stations (of which 24 are closed). The number of hydrometric stations in operation has increased from 1.439 in 1963 to 2,275 in 1969 and is expected to reach 2,840 by 1974. On the average in Australia there is one hydrometric station for each 3,377 sq km. The length of record at 1,720 stations (49% of the total number) is 1 to 9 years. The length of record at 590 stations (16.7%) is over 30 years and at 232 stations (6.6%) is over 50 years. Total surface-water resources of the continent are estimated at 280 million acre-feet (346 cu km). Volume of average annual runoff is 348.3 cu km. Average depth of annual runoff is 45.4 mm, and excluding Tasmania, is 39.5 mm. Water is abundant in regions of the north, northeast, and southeast coasts and in Tasmania. These regions comprise 25% of Australia and have 87% of all water resources (303 cu km). Average depth of runoff in these regions is 154 mm. Arid regions comprise 60% of the continent and have only 4% of the water resources. The depth of runoff in the arid zone is less than 10 mm. (Josefson-USGS)
W74-02757

A METHODOLOGY FOR ASSESSING ENVIRONMENTAL IMPACT OF WATER RESOURCES DEVELOPMENT.
Environmental Impact Center, Inc., Cambridge, Mass.
Available from the National Technical Information Service as PB-226 545 $4.75 in paper copy, $1.45 in microfiche. Final Report, November 1973, 148 p, 32 fig, 19 tab, append. OWRR C-4324 (no9048) (1).

Descriptors: *Evaluation, *Environmental effects, *Water resources development, *Simulation analysis, *Computer models, Economic impact, Social impact, Land use, Recreation, Water pollution effects, Runoff, Aquatic environment, Ecosystems, Biology, Water supply, Urbanization.
Identifiers: *Connecticut River Basin, System dynamics.

Environmental impacts of water resource projects are assessed with a dynamic simulation model. The model consists of modular sectors that forecast regional population and industry, intra-regional land use patterns, and recreational activities. These are linked to a water sector which models stream flows, water supply withdrawals and consumption, and water quality in terms of dissolved oxygen and carbonaceous and nitrogenous oxygen demand. Evaluation of water quality includes effects of point sources, domestic or industrial, and dispersed source wastes from urban runoff. Biological activities, including algal concentrations and fish populations, are modeled separately. The model was applied to the Connecticut River Basin. Forecasts of regional population, industrial growth, gross land use patterns, and their impact on stream water quality were generated. Multi-objective water resource projects could be evaluated through projections of recreational water use, flood plain development, and water quality impacts of flow augmentation. The model can be used to test alternative plans and policies for water resource projects and to identify both direct and indirect environmental impacts.

THE EFFECTS OF AUTHORIZATION FOR WATER IMPOUNDMENTS ON SHORELAND TRANSITION,
North Carolina Univ., Chapel Hill. Center for Urban and Regional Studies.
R. J. Burby, III, T. G. Donnelly, and S. F. Weiss.
Available from the National Technical Information Service as PB-226 553 $8.25 in paper copy, $1.45 in microfiche. University of North Carolina Water Resources Research Institute, Raleigh, Report No. 78, June 1973. 380 p, 1 fig, 69 tab, 118 ref, 3 append. OWRR B-025-NC (2), B-047-NC (2), and B-061-NC (1), 14-31-00001-3314, 3921, and 3625.

Descriptors: *Land development, *Land appraisals, Evaluation, Economics, Project planning, *North Carolina, Equity, *Land management, Land use, Impoundments, *Property values, Prices.
Identifiers: New Hope Reservoir (N.C.), Falls Reservoir (N.C.), Cape Fear River (N.C.), Neuse River (N.C.).

Escalation of real estate prices following reservoir authorization has become a serious problem in development of water resources and preservation of environmental quality. Land markets and land development are examined in two authorized federal reservoir areas in North Carolina including the transactional history of 7,018 land parcels within three miles of the reservoirs from points in time five and six years prior to authorization to five and six years after authorization. Factors associated with variation in market activity and sales prices and their policy implications are evaluated. Alternative federal, state, and local policies are proposed to reduce land acquisition costs, limit speculation, and maintain environmental quality. (Me Junkin-North Carolina)

COMPREHENSIVE REGIONAL WATER AND SEWER SYSTEMS INVENTORY AND ANALYSIS,
Alabama-Tombigbee Rivers Regional Planning and Development Commission, Camden.
S. J. Smythe.
Report No. ALA-TOM 72-02, June, 1972. 123 p, 40 maps, 40 tab, 2 append.

Descriptors: *Planning, *Water supply, *Sewerage, Water quality control, Treatment facilities, *Comprehensive planning, Regional analysis, *Alabama.
Identifiers: *Utility systems inventory, *Alabama-Tombigbee Rivers Region.

An inventory and analysis is the first phase of a two-part comprehensive regional water and sewerage planning program for the 10 county Alabama-Tombigbee Rivers Regional Planning and Development commission region. A major problem in carrying out this program is the lack of data on existing systems and the lack of base maps. This problem stems largely from the fact that the region is quite rural and poor. The report is divded into three main sections: (1) a county-by-county description of physical features, population, and economic base; (2) an inventory and short analysis of each county's water supply systems including water sources, quantities, treatment, and distribution; and (3) an inventory and analysis of each county's sanitary sewerage systems including collection and disposal facilities, costs, and administration. The region has 44 water supply systems serving about 40% of the population and 18 sanitary sewerage systems serving about 30%. (Elfers - North Carolina)

WATER-RESOURCES PLANNING,
H. O. Banks, and J. O. Williams.
Journal of the American Water Works Association, Vol 65, No 11, p 665-669, November, 1973. 3 photos.

Descriptors: *Planning, *Water resources, *Water policy, Federal government, Alternative planning, Comprehensive planning.
Identifiers: *Water resources planning, *Water Resources Council, National Environmental Policy Act.

A report prepared for the National Commission by the Consulting Panel on Water Resources Planning is summarized. The overriding constraint on all sectors of public planning is the lack of clearly defined social, environmental, and economic goals on a national level. Equally constraining is the absence of a governmental vehicle capable of enlisting the entire spectrum of public planning agencies. If effective water-resource planning is to be undertaken, the roles of federal, state and local planning agencies must be better defined. Water-resource planning must be better integrated with overall planning. The most essential need is for an effective institutional and legal framework in which planning can take place. It is essential to recognize that at all levels of government and in all planning activity, the budget function must be wholly separated from the planning function. It is

ecommended that the Water Resources Council e reconstituted to develop a sectorial planning rogram for water and related resources; coor-inate proposals for and conduct planning, evelopment, and management activities, includ-ng and planning activities of regulatory agencies; eview all proposals for Federal authorization nd/or funding water resource development prior o submission to Congress to assure compliance ith sectorial planning and objectives; and to elegate planning roles to 'field' agencies. Public articipation, presentation of a range of alterna-ives, and increased funding and staffing are also alled for in the planning process. (Stein - North Carolina)

UMMARY OF THE SOUTHERN TIER EAST EGIONAL PLAN, BROOME AND TIOGA OUNTIES, NEW YORK.
gner and Niederkorn Associates, Inc., Ithaca, N.Y.

repared for the Southern Tier East Regional lanning Board, Binghamton, N.Y. 1973. 16 p, 12 g, photos. HUD 701.

escriptors: *Planning, *Regional development, Rivers, Population, Economics, Natural esources, Recreation, Flood plains, Urbaniza-ion, Land use, *New York.
dentifiers: *Riverbanks, Open space, Bingham-on, Susquehanna River, Broome County (N.Y.), ioga County (N.Y.), Tioughnioga River, Chenan-go River (N.Y.).

A series of studies for Broome and Tioga Counties emphasizing regional planning is summarized. The planning program is intended to be on-going and focus on spatial and economic relationships that cross political subdivisions. In the first two years of the program studies have included population and economic characteristics of the region, physical and structural characteristics, housing problems, and recreation and open space needs. Special emphasis is put on opportunities for providing recreational facilities and preserving open space and on the great potential of the riverbank areas of the Tioughnioga, Chenango, and Susquehanna Rivers. Major parks and connecting open areas are proposed along the river corridors. Policies established to guide development of the riverbanks include: (1) public leadership and initiative are necessary; (2) county government should provide incentives to local public and private agencies to aid in effecting the plan; (3) funds for land purchase and development should be included in regular capital improvements budget; (4) parcels of publically-owned land adjacent to the river should form nucleus of riverbanks park systems and (5) ecological balance of riverbanks should be maintained. Other proposals and policies include and protection of floodplain areas, the control of surface water runoff, the use of utility easements and abandoned railroad rights-of-way for open space, and the preservation of unique natural features. The overall regional plan recommends an expanded urban core between Binghamton and Endicott with radial development up river valleys. Several guidelines for growth and means to implement the plan are also included. (Elfers - North Carolina)

ENGINEERING ECONOMICS OF RURAL WATER SYSTEMS: A NEW AMERICAN APPROACH,
National Water Well Association, Houston, Tex., Research Facility.
M. D. Campbell, and W. A. Hunt.
Paper Presented at National Water Well Association International Groundwater Symposium, November 20-22, 1973, Macquarie University, Sydney, Australia. 21 p, 8 fig, 15 ref.

Descriptors: *Economic feasibility, Financial feasibility, Project feasibility, *Prices, *Regional economics, *Social impact, *Wells, *Cost analysis, *Project planning, Management.
Identifiers: National Demonstration Water Project, Commission on Rural Water, Centralized management.

A review of engineering principles is presented as applied in the United States by the National Demonstration Water Project and Commission on Rural Water to its field projects. Emphasis is placed on the economic analysis of the various engineering alternatives of surface and ground water utilization in rural areas. Effectiveness of centralized management and organization is stressed. The preference of various American governmental agencies for central water systems is based on the concept of central management, which implicity promotes reliable service over many years. However, central management need not be tied to central water systems in the physical sense. The multiple well or cluster-well concept is introduced and explored within an economic analysis of system alternatives for specific project areas. The role of local conditions as they affect the ultimate configuration of the system's design is defined in quantitative and qualitative terms. (Staplin-NWWA)

THE UNIVERSITY AND PUBLIC POLICY IN WATER RESOURCES, PROCEEDINGS UCOWR ANNUAL MEETING HELD JULY 29-AUGUST 1, 1973 AT TEXAS TECH UNIVERSITY, LUBBOCK, TEXAS.

Universities Council on Water Resources, (University of Nebraska, Lincoln), (1973). 171 p.

Descriptors: *Universities, *National Water Commission, *Water Resources Research Act, Education, Research and development, Regional analysis, Urbanization, Water quality, Agriculture, Economics, Institutions, Water policy, Legislation, Federal Water Pollution Control Act.
Identifiers: *Public policy.

Each year the Universities Council on Water Resources holds an annual meeting on a matter of current and vital interest to the university community. In 1973, the meeting was devoted to a critical appraisal of the National Water Commission Draft Report and an examination of the importance of regional cooperation in research and education. Four workshops were conducted relative to major policy issues on problems of urbanization, water quality, agriculture, and economics and institutions. Regional workshops were organized to explore opportunities and mechanics for regional cooperation and coordination in education and research. The Proceedings includes papers presented, questions and answers on the National Water Commission Report and resolutions passed by the delegates. Papers and reports of discussions represent personal opinions of their respective authors. The resolutions reflect the view of the Universities Council on Water Resources. (See W74-03173 thru W74-03184)

IMPLICATIONS OF THE NATIONAL WATER COMMISSION REPORT FOR THE UNIVERSITIES COUNCIL ON WATER RESOURCES,
Stanford Univ., Calif. Dept. of Civil Engineering.
R. K. Linsley, Jr.
In: The University and Public Policy in Water Resources; Proceedings of UCOWR Annual Meeting, Texas Tech University, July 29-August 1, 1973: Universities Council on Water Resources Publication, p 1-4, 1973.

Descriptors: *National Water Commission, *Universities, *Water Resources Research Act, Research and development, Water utilization, Education, Grants.
Identifiers: *Universities Council on Water Resources.

Implications of the National Water Commission report for the Universities Council on Water Resources are briefly discussed. Areas which seem to the National Water Commission to be of importance for research include: (1) ecological, environmental and social impacts of water resources projects; (2) economic, social and environmental costs and benefits of alternate wastewater management strategies; (3) relationships between energy production and water use; (4) the role of nonpoint sources of pollution in water quality including urban storm water runoff; (5) technology for more efficient water use; and (6) new technologies in water development including such topics as desalting, weather modification, wastewater reuse, and geothermal resources. In planning programs for the future, universities might consider the need to emphasize instruction in planning, based on new guidelines and recognizing a new role for the planner. Public education is a must if public participation in water planning is to be fully effective. The universities can fill an important role in offering short courses, seminars, and lectures on water problems. Perhaps the most important immediate impact of the National Water Commission is the opportunity it offers the universities and university people to play a role in influencing water policy. COMMENTS ON THE REPORT OF THE NATIONAL WATER COMMISSION,
Resources for the Future, Inc., Washington, D.C.
A. V. Kneese.
In: The University and Public Policy in Water Resources; Proceedings of UCOWR Annual Meeting, Texas Tech University, July 29-August 1, 1973: Universities Council on Water Resources Publication, p 5-11, 1973. 2 photo.

Descriptors: *National Water Commission, *Universities, *Water Resources Research Act, Research and development, Water utilization, Education, Grants.

The National Water Commission report is a highly useful document for the student of water resources problems, but it would be of little value to the policymaker. It is much too long and the recommendations are given without any sense of priority. There are hundreds of such recommendations ranging from the fundamental to the trivial. The report contains many important recommendations. Among them are reform of the present procedures for benefit-cost analysis of navigation projects, improved pricing of various water services including navigation and irrigation, ending subsidies to new irrigation projects, non-Federal sharing of costs where specific users cannot be charged or where it would not be desirable to, reducing the impact of acreage limitations, conjunctive management of ground and surface water, and improved possibility for transferring water rights. OPPORTUNITIES FOR REGIONAL COORDINATION AND COOPERATION IN WATER RESOURCES RESEARCH,
Office of Water Resources Research, Washington, D.C.
W. A. Hall.

In: The University and Public Policy in Water Resources; Proceedings of UCOWR Annual Meeting, Texas Tech University, July 29-August 1, 1973: Universities Council on Water Resources Publication, p 25-32, 1973. 1 photo.

Descriptors: *Water Resources Research Act, *Universities, Education, Grants, Research and development.

In 1972, Office of Water Resources Research supported just under a thousand individual research studies conducted by 148 university campuses and 46 nonuniversity organizations. Water resources institutes provide a broad set of serious problems which will require the best requisite administrative control. Regional research in water resources would give universities the opportunity to demonstrate that the universities can indeed modify their institutional environment to accept the challenge of putting their resources to work on civil systems; that they can manage a big science research approach to civil problems in a systematic, effective, and timely way; and, at the same time, extend basic knowledge, enhance teaching, and make public service of such a quality to restore public confidence in the university system. W74-03175

REGIONAL RESEARCH OPPORTUNITIES UNDER EPA SPONSORSHIP,
Environmental Protection Agency, Washington, D.C. Office of Research and Monitoring.
A. P. Carlin.
In: The University and Public Policy in Water Resources; Proceedings of UCOWR Annual Meeting, Texas Tech University, July 29-August 1, 1973: Universities Council of Water Resources Publication, p 33-36, 1973.

Descriptors: *Federal Water Pollution Control Act, *Universities, Grants, Training, Water quality act, Education, Water quality, Research and development.

The most important criteria against which all of EPA's proposed projects in research are judged are the importance of the problems addressed from a national standpoint and the potential transferability of the knowledge gained to similar problems elsewhere. Section 104 (s) of the Federal Water Pollution Control Act Amendments of 1972 provides that the Administrator of EPA is authorized to make grants to one or more institutions of higher education (regionally located and to be designated as River Study Centers) for the purpose of conducting and reporting on interdisciplinary studies on the nature of river systems, including hydrology, biology, ecology, economics, the relationship between river uses and land uses, and the effects of development within river basins on river systems and on the value of water resources and water-related activities. SOCIAL AND ECONOMIC IMPACT ON URBAN AREAS OF 'WATER POLICIES FOR THE FUTURE,' THE NATIONAL WATER COMMISSION REPORT,
Georgia Inst. of Tech., Atlanta. Environmental Resources Center.
G. E. Willeke.
In: The University and Public Policy in Water Resources: Proceedings of UCOWR Annual Meeting, Texas Tech University, July 29-August 1, 1973: Universities Council on Water Resources Publication, p 39-48, 1973. 3 ref.

Descriptors: *National Water Commission, *Social aspects, *Economics, *Planning, Water utilization, Water policy, Water resources development, Cost allocation, Cities, Urbanization.

The National Water Commission's conclusions and recommendations are of great importance to urban areas. Its positions on the conduct of specific programs, especially water quality, on the division of powers among levels of government, on subsidies, on responsibilities, and on evaluation procedures are strong and represent considerable departures from the present situation. The Commission's report is a policy document, proposing policies that touch on almost every important aspect of the use of water resources. The Commission proposes that identifiable beneficiaries should pay for the costs of obtaining those benefits that accrue to them. A polluter of the environment should pay for maintaining environmental quality. Development, management, and protection of water resources should be controlled by the level of government that is closest to specific problems and capable of fairly representing all interests involved. Sound economic principles must be adopted to encourage better use of water resources. Future water programs should shift emphasis from water development to preservation and enhancement of water quality. Planning for water development must be linked to planning for water quality and coordinated with land use planning. It is suggested that on balance, urban areas should be better off if the Commission's recommendations are followed. The benefits should be better service, reduced red tape, greater self-reliance and competence, and fewer crises. Most water crises could be averted by planning, conservation measures, and willingness to consider a wider range of alternatives. (See also W74-03172) (Knapp-USGS)
